In fact, Hindu members including the Congress and Hindu nationalists, found the Select Committee Report more communal and as such more reactionary. The debate on the report was more tense and hence revealing. Syamaprasad Mookerjee, the leader of the Hindu Mahasabha, supported the recommittal motion of the Congress leader Harendra Choudhury and upheld the cause of secular education. He said, "in Bengal political and official domination is closely linked up with communal squabbles which, if unchecked, will sound the death-knell of true education... We want our secondary education to develop purely on secular lines."[70] While Syamaprasad advocated for secular education, Sarat Chandra Bose, the leader of Congress opposition appealed to all to approach the bill from a nationalist standpoint. He said, "This bill mortgages the future. It stretches the grasping hands of reaction and sectionalism towards posterity."[71]

It was Atul Chandra Sen, another congress leader, who defined the secular and national education as perceived by the Hindus of Bengal. He said, "It is openly hinted that the Hindu mind is at present dominating education and educational ideas in the land. Yes, this is true and for historical reasons. When the English culture invaded this land the Hindu mind with its innate catholicity and receptiveness drank deep of this culture while our Muslim brethren stood sullenly away...being enriched by the new ideas the Hindu mind began to build up a new culture—not a Hindu culture in the narrow sense, but an Indian culture, in which all communities and individuals, Hindus and Musalmans, Rabindranath and Iqbal alike must contribute if they love themselves, their community and the land they inhabit and want to earn for it an honoured place in the community of nations..." He further said, "we regard cultural differences as mere mental angularities which without losing the mental substance may be rounded off by closer and closer political and cultural contact—by creating a composite culture of all communities inhabiting the land...".[72]

This discourse may remind one of the Hindu Mahasabha thesis of *Hindutwa* as a non-religious cultural concept of Indian origin. Hindu Mahasabha thesis by implication excluded Moslems as non-Indian while this nationalist theory of composite cultu or cultural synthesis admit of even t Moslems into an Hinduised Indian cultu In fact, Moslems in general, never did li this theory of cultural synthesis as they co sidered this to be a process of Hinduisati of Moslems in India. Abul Monsur Ahme a prominent political person of the tim observed in this regard thus: "the reason wl there was no Hindu-Musalman unity w Hindus wanted Musalmans to merge in Hindu society as Aryans, non-Aryans, Sal and Huns did. Musalmans ought to becon Hinduised Musalman. To be India Musalman would not do. Not only Congre and Hindu Sabha but even Rabindranat Tagore opined thus."[73] Deliberations o Moslem members in the assembly indica that this was the general impression o Moslems about the theory of cultural syn thesis. The responses of Rabindranat Tagore, Profulla Chandra Roy and othe Hindu public men to the proposed bill onl strengthened their impression further.

We would better complete our story in th assembly before going out to survey th public responses outside. On September 4 1941 the opposition amendment for th recommittal of the bill to the same selec committee was rejected by the House by 12 to 56 votes. Opposition thereafter took a dilatory tactics and moved a number o amendments on different clauses of the bill Division was sought on every motion o amendments. Some of the clauses were passed during the month of September. Meanwhile a ministerial crisis cropped up and on December 16, a new ministry headed by A K Fazlul Huq including Syamaprasad Mookerjee as finance minister took over the charge. As a result the bill along the clauses already passed was allowed to lapse.

In the 13th session of the assembly in April 1942, a new secondary education bill was introduced by the new progressive coalition ministry as it was called. Abul Kasim, the education minister, proposed to refer the bill to a select committee with instruction to submit its report by July 31, 1942. The bill had the same fate. The select committee virtually could not function as various technical objections were raised by some members. Time for submitting the report had to be extended for as many as five times and on the last occasion till March 31, 1943. But in that very month Fazlul Huq was forced to resign by the governor. Syamaprasad however had resigned from the ministry in November 1942. The bill was thus dropped automatically. On May 10, 1944, Temizuddin Khan, education minister of the Moslem League ministry moved the Bengal Secondary Education Bill, 1944. But before the bill could get through the assembly, Bengal was partitioned into two countries. Hindu members kept their word and unsettled the settled fact of communal representation in educational management but at the cost of partition of Bengal.

Syamaprasad Mookerjee, the most vocal

nd forceful opponent of communal representation in the field of education, supported the partition of Bengal while Fazlul Huq who advocated for communal representation and introduced the bill in the assembly, made an all-out effort in favour of an united Bengal. But that is another story.

VIII

Let us now turn towards the picture outside the assembly. There is no doubt that the Secondary Education Bill stirred the Hindu public opinion in an unprecedented manner. This stiffened the Moslem attitude further. The bill was gazetted on August 1, 1940. On the very next day Syamaprasad Mookerjee on behalf of the Bengal Hindu Mahasabha issued a statement saying, "Hindus of Bengal must observe in a befitting manner Sunday August 4, which has been declared as 'An All Bengal Protest Day'."[74] In a letter to the branch secretaries of the Sabha he wrote, "The Hindu Mahasabha has no right to exist if it cannot boldly fight against the deliberate acts of injustice which have been committed or about to be committed by the ministry."[75] On August 3, 1940, *Amrita Bazar Patrika* called the bill 'A Ruinous Education Policy', and wrote, "Thus, the Hindus on whose sacrifice the university has been built are given sack. The board is to be officialised largely, Moslemised partly, with the Hindus as of no consequence whatever."[76] On August 4, a protest meeting was organised at Sraddhananda Park, Calcutta. According to *Amrita Bazar Patrika,* a crowd of thirty thousand at the modest computation gathered. Saffron robed sanyasins with red tridents lent an unusual feature. Syamaprasad hinted at launching mass civil resistance if their demands were not fulfilled.[77]

As days passed the protest movement by Hindus got momentum and grew more and more powerful and voluminous. There surfaced an instinctive Hindu solidarity; old rivalries were forgotten; party polemics were dropped; Bose-League pact was condemned. Hindu Mahasabha grew as a very powerful organisation and its popularity almost touched the sky. Syamaprasad became the hero. Hindu Mahasabha, Congress and most other organisations dominated by Hindus got united on one platform over this issue.

On August 6, a public meeting of the representatives of the members of the managing committees and teachers of schools in Calcutta and suburbs was held in the Albert Hall under the presidentship of Harendra Coomer Mookerjee. The meeting considered the bill 'anti-national' and 'reactionary' as it would make education subservient to political and communal considerations. The meeting protested against government control and communal representation. It further pointed out that the bill ignored "the legitimate claims of the teachers of secondary schools in respect of their representation on the board and the executive council."[78] It is surprising that in the assembly debate hardly any member raised this very important point. It may also be noted that members of managing committees and teachers unitedly joined the protest movement although the main objective of the teachers' movements till then was to fight the tyranny of the managing committees of the educational institutions. In fact, this bill threatened the interest of managing committees of aided and unaided recognised schools. There was hardly anything in the bill for the teachers as a community, to fear or to lose.

On August 18, the annual conference of the Calcutta Teachers' Association adopted a resolution condemning the bill. Syamaprasad Mookerjee opening the conference threatened that if the bill was passed he would advise the Hindus to constitute a separate secondary education board for them.[79]

All Bengal Teachers' Association organised a special session on December 28 at the University Institute Hall. It resolved, "The Bengal Secondary Education Bill is a dangerously disruptive measure and will retard the progress of education in Bengal, and that as it is academically and nationally an unsound policy to introduce communalism in the sphere of education, the bill should be immediately withdrawn."[80] By now different district associations and more than 400 schools adopted such resolutions. ABTA, however, recognised the fact that the 'violent storm of protest' against the bill was raised by the 'educated non-Muslim communities' and appealed to the Moslem community in Bengal "to rise to the height of the occasion by proclaiming that they shall be no party in consenting to the introduction of communalism in education."[81] The Moslem response was that, not the bill, but the protest movement was communal.[82] ABTA like all other Hindus, failed to take cognisance of the fact that the prevailing education system was considered by the Moslems as communal in substance and structure.

On August 25, another meeting was held at Sradhananda Park convened jointly by Syamaprasad Mookerjee, Sarat Chandra Bose and Hem Chandra Naskar to protest against the bill. Both Mookerjee and Bose reiterated that if the bill was passed in spite of their protest they would build their own council to organise and control their own system of education.[83]

Syamaprasad Mookerjee toured through different districts of Bengal and addressed public meetings organised by local Hindus. They gave him rousing receptions everywhere. By December 1940 the movement reached its peak when a massive protest conference was organised by the Hindu leaders of Bengal. A reception committee of 1,200 persons was formed including Syamaprasad Mookerjee, Sarat Chandra Bose, Nirmal Chandra, Naliniranjan Sarkir, Bidhan Chandra Roy, Nilratan Sarkir, Kiran Sankar Roy, Tulsi Goswami, H C Mookerjee, and others. The reception committee in an appeal said, "if government persists in carrying this bill through the legislature in its present form the Hindus and the communities other than Moslem in this province may feel compelled to demand that there should be a separate authority established for their education... We should be prepared to take steps for constituting our own Board of Education...".[84]

The conference continued for three days from December 21 to December 23 at Hazra Park and was presided over by Acharya Prafulla Chandra Roy, the most respected publicman of the time next only to Rabindranath Tagore. Rabindranath Tagore sent a message to the conference. According to *Amrita Bazar Patrika*, 3,200 delegates representing the "educational institutions and interests in all parts of the province" participated in the conference. Jadunath Sarkir, S Radhakrishnan, Meghnad Saha, Hirendranath Dutta and almost all other leading educationists, politicians and intellectuals who were Hindus were present at the conference. On the opening day 10,000 people attended it.[85] Nationalist press gave it unusual publicity.

Rabindranath Tagore in his message and Prafulla Chandra Roy in his presidential speech sounded a warning against the intrusion of communalism in the 'sacred shrine of learning'. They, however, equally failed to appreciate the Moslem point of view and their sentiments. Tagore in his message wrote, "we are proud of our Bengali language which must be preserved from harm and nourished by the devotion of our people; no sacrifice would be too great in the task of strengthening its foundations in the minds of our new generation at the educational institutions and outside...the danger which menaces the cultural existence of my province has touched me profoundly and I cannot help sending these few words even from my sick-bed."[86]

In fact, a bogey was raised by the nationalist press and Hindu intelligentsia that the present government was encouraging Moslemisation of Bengali language and culture. *Amrita Bazar Patrika* on October 18, wrote an editorial with the title 'Moslemisation of Bengali language'. It said, "we have on several occasions had to discharge the painful duty of exposing the vagaries of the Bengal Text-Book Committee...of late, there has been unfortunately displayed an increasing tendency on the part of certain Moslem writers to introduce in Bengali literature outlandish Arabic and persian words... The Bengali language, it should be remembered, has been like so many other languages derived from Sanskrit. Necessarily, therefore, it is profoundly influenced by that mother of all languages not only as regard its vocabulary but its general character and style as well. Our Mahomedan friends, who are for the most part Hindu converts to Islam, has no reason to take umbrage at this or to consider it as a slight to their religion and culture."[87] It was for this attitude of Hindus that Abul Monsur Ahm-

ed alleged that Hindus wanted us to be Hinduised Moslems.[88]

Prafulla Chandra Roy in his written speech said, "... Indeed, I am fully convinced that, of all the misdeeds and misadventures of the present ministry, the Secondary Education Bill is the most mischievous from the nationalist stand point."[89] He further said, "with exception of about 50 government schools and less than 150 schools maintained by the Christian missions, secondary education in the province is provided in the institutions built up and maintained by the Hindus...is it any wonder that the Hindus refuse to accept a measure which seeks not only to restrict the scope for their intellectual progress but to strike at the very root of their own culture"[90] by official control on communal basis. He even expressed resent against such provisions of the bill as would deprive Calcutta University of its rights to recognise schools, to admit candidates to the matriculation examinations and framing the syllabuses and prescribing the text-books.[91] It is evident that Roy would not take note of the Moslem resentment against Calcutta University as an institution with Hindu bias.

The conference condemned the bill on many grounds and demanded its immediate withdrawal. It condemned the bill as it "makes the interest of education subservient to political and communal considerations, and completely ignored the academic and cultural point of view which is absolutely essential to the building up of a sound system of national education."[92] It is evident that the conference ignored the Moslem point of view. Moslems in fact, contested the claim that the present system of education was apolitical, non-communal and secular. According to them it had definite Hindu cultural bias and as such communal. Besides, they refused to accept nationalism as developed in India, as a secular ideology. To their mind it was Hindu nationalism and as such not acceptable. In fact, here lies the crux of the problem.

It is also evident that not all the resolutions adopted in the conference were entirely free from communal bias. It was stated in one resolution that, "the bill is specially designed to cripple the educational interests of Hindus of Bengal, who supply about 75 per cent of the pupils and even a larger percentage of the funds of the secondary schools in the province."[93] Another resolution reads, "The bill places the preparation and publication of text-books in the hands of special committees which are of predominantly communal character... The bill will seriously affect the integrity of the Bengali language and literature and will destroy the culture of the province, the manifestations of which are already clearly visible in the existing text-books approved by the education department now under communal influence."[94] Now Moslems for long, have been alleging the same against Hindus who were dominating the system of education in all is spheres.

The conference even gave a call for raising funds and to take measures towards constituting a separate authority for the secondary education of Hindus and other non-Moslem communities.[95] This was no doubt a separatist slogan and no less communal than communal representation. After the conference Fazlul Huq in a statement alleged that, "I have not the slightest doubt that the agitation is based on intensely communal grounds, and in a narrow spirit on non-appreciation of the claims of all communities except a section of the caste Hindus."[96] He even said that he was prepared to amend or even withdraw the bill if it was opposed on purely educational grounds. Prafulla Chandra Roy in a rejoinder denied the allegation that the bill was opposed on communal grounds and maintained that a look through the resolutions of the conference would show that the opposition was mainly on educational grounds.[97] This was a peculiar situation.

Moslems defended communal representation to restore a balance in the educational system which in its composition and content was heavily tilted towards the Hindu community. In this, however, the Hindu leaders saw the opening of the floodgate of communalism in the educational system, the only remedy for which, according to them, lay in the constitution of a separate board.

A resolution of these diametrically opposite stands was not easy to come by. Bengali Moslems in their new quest for an identity found in the issue a rallying point just as the Hindu sentiment that was whipped up during the controversy cut across political parties and even secular associations like All Bengal Teachers' Association. As the battle lines began to be drawn more rigidly the weakness of the ideology of Indian nationality came out more sharply with words like the 'Indian' and 'Bengali' becoming more suspect and a major bone of contention between the communities.

Notes

[This paper was presented at a seminar 'Education and Democracy' organised by the Nehru Memorial Museum and Library, Delhi in October 1988.]

1 Anisuzzaman, *Muslim Manas O Bangla Sahitya* Muktodhara, Calcutta, 1971, pp 81, 96-97. Anisuzzaman observed, "It was most unfortunate that nationalism and Hindu revivalism became synonymous." He further observed, "the theory of separate Hindu Moslem nation took root as Hinduism and nationalism became synonymous."
Sarkar Sumit, *The Swadeshi Movement in Bengal*, Peoples Publishing House, Delhi, 1973, p 411. Sarkar also writes, "Patriotism tended to be identified with Hindu revivalism, 'Hindu' and 'nationalism' came to be used as almost synonymous terms—a good example would be 'National Nabagopal Mitra with his Hindu mela."

BOP Problems of Developing Countries and International Division of Labour

Some Theoretical Comments

Prabhat Patnaik

This paper examines the proposition that, apart from minor modifications such as those arising from the infant industry argument, a regime of universal free trade represents the optimal trade arrangement for each of the participants in international trade. Those who advocate trade liberalisation for underdeveloped countries necessarily subscribe to this proposition implicitly, though it is rarely, if ever, spelt out in theoretical terms.

THE argument advocating a 'liberal' trade regime for the underdeveloped countries has made a strong reappearance in recent years. The reasons for this reappearance will not concern me here. The following comments are devoted entirely to an examination of the theoretical rationale underlying this argument and its validity.

There are at least three distinct levels at which the argument for trade liberalisation in the underdeveloped countries is presented. At one level it merely states that transformation through trade is a possibility which must be incorporated into any planning exercise in an underdeveloped country, and that in restrictive trade regimes the potential benefits arising from the utilisation of this possibility are often ignored. In short, a restrictive trade regime predisposes the economy towards an arbitrary truncation of the set of activities over which the optimisation exercise should be carried out.

At another level, the argument proceeds by invoking an altogether different notion of 'inefficiency' which I would call the 'inefficiency of indiscipline' as opposed to 'allocational inefficiency' or the 'inefficiency of production structure'. Here the argument states that a restrictive trade regime, by cordoning off the domestic producers against competition from abroad, removes the shackles of discipline to which they should be subjected in order to achieve efficiency of resource use, in the sense of avoidance of waste, and economy in input application.

The argument at neither of these levels, however, taken on its own, is particularly convincing. To say that underdeveloped countries should utilise trade possibilities is as bland and unexceptionable a statement as saying that they should 'act wisely'. In any case it does not in itself amount to a case for a change in the trade regime. The further link sought to be established between the nature of the trade regime and inoptimal choices is tenuous and cuts both ways: if a restrictive trade regime predisposes the economy towards certain kinds of inoptimal choices, a liberal trade regime could very well predispose it towards other kinds of inoptimal choices. Likewise unless it can be demonstrated that a liberal trade regime would not push the economy into other serious problems, such as recurring balance of payments deficits, to advocate such a regime as a 'disciplining device' for the domestic producers is clearly *non sequitur.*

Central Proposition

Thus, both these arguments, if they are to have any substance, must be supported by an argument at a third level, namely, that under liberal trade regimes developing countries can achieve higher rates of growth than under restrictive trade regimes, together with balance of payment equilibrium. Such an argument can be made in its generality only if the following proposition is subscribed to: that apart from minor modifications, e g, those arising from the infant industries argument, a regime of universal free trade represents the optimal trade arrangement for each of the participants. In my view, those who advocate trade liberalisation for underdeveloped countries necessarily subscribe to this proposition implicitly, though it is rarely, if ever, spelt out in theoretical terms. I shall be concerned with examining this proposition in the rest of this paper.

The demonstration of the superiority of free trade over restrictive trade arrangements for each participating nation in international trade, by a galaxy of economists from Ricardo onwards, has been carried out, as is well known, in a static context. A large body of literature has developed which draws attention to its inadequacy in a dynamic context. Instead of reviewing this literature, I shall confine myself here to developing a simple argument which captures some of the points made in it, and also drawing attention to certain elementary problems which developing countries have to face in the context of an international division of labour.

Consider a world economy which is divided into two segments A and B engaging in trade with one another. If the relative prices at which commodities, all of which are assumed to be tradables, trade against one another, are fixed, if A and B are specialising in the production of different sets of commodities, and if trade between them is to be balanced, then the total outputs in the two segments must be in the ratio $\frac{OA}{OB} = \frac{m_b}{m_a}$

where m_a represents the average import propensity of B for A's products and m_b represents the average import propensity of A for B's products. If these propensities which represent both input as well as final consumption requirements from 'abroad' remain unchanged over time, both segments can grow at an identical rate over time.

Suppose, however, A is a net exporter of primary commodities to B and technical progress in B takes the form of lowering over time the primary product requirement per unit of B's output, then, other things remaining the same, the growth rate of A will be systematically less than the growth rate of B, since m_b would be progressively shrinking in value over time. This point is well known, but it is only a particular example of a more general point: if in trade between two segments, the import propensity of one declines over time while that of the other does not, then the one with declining demand for its products would have to grow slower than the other if trade has to be balanced. To avoid such a fate, A would either have to start economising on imports from B to an equivalent extent, so that m_a falls in tandem with m_b, or push out other exports to B to make up for the slower growth of primary product exports, so that overall there is no decline in m_b, or adopt a combination of both sets of measures so that $\frac{m_b}{m_a}$ remains unchanged over time.

Relative Prices

It can of course be argued that relative prices are not fixed; and that with technical progress occurring, relative prices are bound to change over time. To meet this argument, let us assusme a simple pricing rule. Taking A's product as the numeraire, suppose the wage-rate in B in any particular period is given as $\bar{W}$, and that the price of B's product, i e, the terms of trade, is determined by a mark-up pricing rule

$$p_b = (m_b^l + \bar{W}l)(1+\pi) \qquad \ldots (1)$$

where m_b^l is the *physical* amount of A's product required per unit of B's product, l is the labour requirement per unit of B's product and π is the profit-margin, then again it can be shown that a decline in B's propensity to import A's product, whether as current input for production or for final consumption, will cause a slower growth of output in A than in B. This divergence in

the rates of growth will also extend to the net output of the two sectors, each evaluated in terms of its own product.

Thus, doing away with the assumption of fixed prices, and introducing a pricing rule whereby one segment acts as a price-maker, with mark-up pricing, and the other as a price-taker, makes no difference to the argument. But it does bring out an additional point of importance: if A, finding itself in a position where maintaining a growth rate equal to B's involves it in a balance of payments deficit, decides to devalue its currency, that would not have the slightest impact upon the situation. A devaluation by A would, on the assumption of mark-up pricing and fixed wage (recorded in A's product), not even change the relative prices of the two countries' products, in which case the devaluation would have had no impact whatsoever. If, on the other hand, owing to devaluation $\bar{W}$ reckoned in A's product rises, devaluation would succeed in improving the balance of payments while maintaining a growth rate comparable to B's, but the adverse terms of trade movement owing to devaluation would mean that the standard of living in A would grow slower than its output. If owing to continuous technical progress B's import propensity from A steadily diminishes, then devaluation will have to be a continuous one, and in such a case even if A and B maintained the same growth rates of output, with a balance in their trade, the growt rate of the standard of living in A would be smaller than this growth rate of its output. In other words, the conclusion about the divergence of output growth rates will no longer hold, but will be replaced by a conclusion about the divergent growth rates of living standards.

The divergence in the growth rates of living standards of the employed population between A and B which arises because of B's saving on the use of primary products exported by A is in addition to the divergence which arises because of the faster rate of growth of labour productivity in B than in A. It has been argued by many, notably Kaldor, that the manufacturing sector is intrinsically amenable to a faster rate of growth of labour productivity than the primary producing sector. If real wages in B, the segment where the manufacturing sector predominates, move up with productivity, so that $\bar{W}l$ in equation (1) remains unchanged, then, with given m_b^l, the terms of trade between A and B would have remained unchanged as well. And this would already have ensured, even with identical growth rates of output in A and B, a faster growth of living standards of the employed population in B in comparison with A. But if additionally the growth rates have a tendency to diverge but are kept equal only by A continuously depreciating its currency and moving the terms of trade against itself, then this is a further reason for the growing divergence of living standards.

Import Propensities

Let us however leave aside the question of labour productivity growth, and concentrate exclusively upon the divergence arising from a divergent movement of import propensities. Price adjustments, such as a devaluation, in such a situation are obviously not of much help in overcoming the basic cause of divergence which has to do with changes in technology and tastes. (In the case of divergent movements of labour productivity, the change in import propensities would be caused by the changing demand pattern even with given tastes.) The appropriate strategy for A in this situation would be to adjust its production structure in such a way that it either lowers its own import propensity or pushes out newer goods to B to take the place of those goods from which B's demand is shifting away. The former, which is the import substitution strategy, is the one which of late has come under attack. Those who criticise it would presumably argue that A should continue to link its economy to B's, but adjust the production structure in such a manner that newer avenues of exports keep getting opened up. For opening new export avenues, which necessarily means a familiarity with changing tastes in B as well as access to new technologies, A would have to induct B's firms, the MNCs, into its own production structure.

The argument for a liberal trade regime here becomes a very different one, namely, not that a liberal trade regime gives rise to an international division of labour which in itself is beneficial to all participants, but that a liberal trade regime creates the appropriate environment in which capital and technology flows can take place under the aegis of multinational corporations so that any frozen pattern of international division of labour keeps getting broken up and adjusts to new circumstances. Since it is this argument, rather than the usual one pointing to the benefits of an international division of labour, which in some ways is its diametrical opposite, that is more prevalent nowadays, let us turn to it.

I shall not go into the plethora of arguments, about the type of political regime in developing countries that succeeds in attracting export-oriented MNCs, about the uncertainties which the domestic economy is subjected to by a strategy of this kind, about the extent to which such a strategy can succeed for developing countries *as a whole* and about the impact of technological changes currently underway in the world economy on the future willingness of MNCs to locate production away from markets, all of which are well known and which underline the limitations of such a strategy. I shall confine myself to merely one point, which, in addition to the above-mentioned points, seems to me to be of great practical importance for large economies like India, and perhaps China.

Demand Patterns

Consumer tastes in underdeveloped countries are strongly influenced by those in the developed capitalist economies of the west. In countries like India, of course, this is a result of the colonial past which leaves an indelible imprint on the psyche of the bourgeoisie. Even in countries charting a different course of social development like China, this factor is not altogether absent. As a result, demand patterns tend to get handed down, with a lag of course, from the west, and within the underdeveloped economy itself, they have a tendency to filter down, at least up to a certain layer in society. The ease with which such demand patterns are satisfied depends upon the availability of the particular goods. Thus, the production of new goods to suit western tastes under the aegis of MNCs in developing countries has the paradoxical effect, first of creating, even more rapidly than would have been the case otherwise, a taste for such goods within certain social groups in the developing country itself, and secondly, of actually meeting the requirements of such created tastes through the greater availability of the goods in question within the host country. In short, inviting foreign capital to produce for exports with the objective of raising m_b in the above model has the paradoxical effect of raising m_a as well, since a whole lot of components, inputs and equipment have to be imported for the production of the goods, which goes at least partly into the home market of the host country.

Now, for a small country, the relevant segment of the home market is easily satisfied in any particular product-line, so that within a short time the export-augmenting effect of the new production begins to triumph over its import augmenting effect. For a large country, however, this is far from being the case. The sheer absolute size of the market provided for such a new commodity within the host country, even when this market is confined to a small stratum of the population, is so large that by the time the export-augmenting effect can be expected to out-weigh the import-augmenting effect, the country would have built up a sizeable debt in the process of financing recurring trade deficits, and the commodity itself would have become obsolete as far as western tastes are concerned. For a large country, therefore, the attempt to promote export-led growth by introducing liberal trade regimes and new products with the help of MNCs, results only in aggravating the trade deficit, and the promised turnaround in the trade balance never actually materialises. Thus, liberal trade regimes have an effect contrary to what the proponents of such regimes visualise.

Cases of India and China

All this is no mere speculation. In India, export-processing zones, set up with the explicit objective of boosting foreign exchange earnings, have hardly succeeded in earning much hard currency foreign exchange (a good deal of their exports go to the eastern bloc countries) but have ended up clamouring for permission to sell a part of their output within the domestic economy, a request that has been granted up to certain limit. They have become perhaps net losers of hard currency foreign exchange as a consequence. Even in China, the free-trade zones have succeeded in pressurising the government to allow them access to the domestic market. China's burgeoning trade deficit since the days of 'liberalisation' is partly a reflection of this phenomenon. It is not surprising that large countries, with the strong pull of the domestic markets, have not been particularly successful in establishing export-oriented MNC units on their soils, while small countries have fared much better in this respect. A liberal trade regime in the former acts much more in the direction of raising their import propensities for foreign goods, than of raising foreigners' import propensities for their goods.

This phenomenon becomes particularly worthy of attention today when both China and India are reportedly on the verge of approaching the IMF for large loans, and inviting its conditionalities, as a means of financing their recurring trade deficits. India by now has perhaps already emerged as the third largest debtor among the developing countries, and is borrowing about $ 8 billion every year. To be sure, not all of it can be directly attributed to the reason mentioned above, but a good part of it can. And a big chunk of even the remainder perhaps arises because of the general atmosphere of import permissiveness which a liberal trade regime introduces. At any rate, it is time that we thought hard and carefully about the concrete consequences for particular economies of some of the panaceas which are being blandly suggested these days for the ills of the developing countries.

THE ASSOCIATED CEMENT COMPANIES LTD.

(Registered Office: 'Cement House', 121 Maharshi Karve Road, Bombay 400 020)

NOTICE

Form IIA (See Rule 4A(I))

It is hereby notified for the information of the public that The Associated Cement Companies, Limited (ACC) proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969. for approval to the production of the new articles in the existing undertaking.

Brief particulars of the proposal are as under:

1. Name and address of the applicant : The Associated Cement Cos. Ltd., Cement House, 121, Maharshi Karve Road, Bombay 400 020.

2. Capital structure of the applicant organization : ACC's capital structure is as indicated hereunder:

	Rupees Lakhs
a) Authorised Share Capital 75,00,000 equity shares of Rs.100 each	7,500.00
b) Subscribed Share Capital 55,95,504 equity shares of Rs.100 each	5,595.50
c) Paid up Share Capital 55,95,504 equity shares of Rs.100 each	5,595.50

3. Management structure of the applicant organization indicating the names of the Directors, including the Managing/Whole-time Directors and Manager if any. : The ACC is managed by a Executive Vice–Chairman & Managing Director under the supervision, direction and control of its Board of Directors. The following are the Directors of ACC Ltd.:—

1. Mr. N.A. Palkhivala (Chairman)
2. Mr. Pallonji S. Mistry (Deputy Chairman)
3. Dr. S. Ganguly (Executive Vice-Chairman & Managing Director)
4. Mr. S.R. Vakil
5. Mr. P.K. Mistry
6. Mr. H.T. Parekh
7. Mr. Harish Mahindra
8. Mr. S.G. Subrahmanyan
9. Mr. P.J. Jagus
10. Mr. H.C. Sarin
11. Mr. D.S. Seth
12. Mr. N.A. Soonawala
13. Mr. T.M.M. Nambiar (Wholetime Director)
14. Mr. R. Bhattacharya (Wholetime Director)
15. Mr. M.M. Rajoria (Wholetime Director)
16. Mr. J.K. Sarkar
17. Mr. V.J.B. Andrews
18. Mr. Vishwanath Patil Hebbai, MLA
19. Mr. Devendra Raj Mehta
20. Mr. Sushil Kumar, IAS
21. Mr. Anil De, IAS (Retd.)

4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division : The proposal relates to the manufacture of four new articles in the existing undertaking at Katni in Madhya Pradesh State.

5. Location of the new undertaking/unit/division :

Place	Katni
Tehsil	Murwara
Dist.	Jabalpur
State	Madhya Pradesh

6. Capital structure of the proposed undertaking : The proposed undertaking is part of the applicant Company whose capital structure is given at (2) above.

7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate

(i) Name of the goods/articles	(ii) Proposed licenced capacity	(iii) Estimated annual turnover Rs. Lakhs
Catalyst bed supports	1000 TPA	120
Alumina Binder	20000 TPA	1000
Demolishing chemicals	1000 TPA	100
Refractory Special Intermediates	6000 TPA	480

8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Not applicable

9. Cost of the project : Rs.480 lakhs

10. Scheme of finance indicating the amount to be raised from each source : Amount will be raised partly from internal resources and partly from financial institutions.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

For THE ASSOCIATED CEMENT COMPANIES LTD.

Falling Rate of Profit in India's Industry?

Ranjit Sau

The Marxian law of falling tendency of the rate of profit has taken hold of several developed capitalist economies of the world, with the rising strength of labour that squeezes profitability. To test the law empirically, not only the value categories are to be translated in terms of prices, but one has also to extend the investigation from the level of national accounts to that of company accounts which this paper does. The large companies of India have not experienced any secular decline in the rate of profit, although they might have seen cyclical variations. The explanation for the steady trend lies in the falling share of wages and salary in value added, which also indicates the existence of objective ground for class conflict. The government takes away about one-half of the industrial output in the shape of interest, and direct and indirect taxes.

BY all accounts the rate of profit in major capitalist countries of the world is falling in recent years. Marx enunciated the famous law of the falling tendency of the rate of profit.[1] Competition among capitalists, so goes the argument, spurs technological change that raises the capital intensity of production and thus lowers the return on capital. This outcome is only a tendency; it may get neutralised by countervailing forces. For instance, technological change may also cheapen the basket of wage goods and thereby help keep up the profit rate on balance.

A theoretical challenge to this Marxian law came in the shape of the Okishio (1961) proposition: technical change which competitive capitalists would introduce always raises the rate of profit, should the real wage rate be constant. In due course this theorem has been further refined and extended (Bowles 1981; Roemer 1977, 1978, 1979). The crux of the matter lies in the provision that the real wage rate remains constant. It can be shown that relaxing this postulate, and instead assuming a constant share of wages in value added, the Okishio theorem can be refuted (Laibman 1980).

Meanwhile, another front was opened. Baran and Sweezy (1966:80) came to the conclusion that the Marxian law of falling tendency of the profit rate relates to the age of competitive capitalism. In the current era of monopoly capitalism it is superseded by the law of rising surplus. They had, it seems, in front of them the rising curves of profitability of the post-war boom. Soon after their writing a new chapter began in the major capitalist countries around the world. Almost everywhere, in Britain, Canada, France, Germany, Japan , the United States, the rate of profit showed a declining trend.

Some economists first dismissed it as a rather cheerful sign of abundance of capital accumulation—the marginal productivity of capital has gone down with the rise in capital stock, so they thought.[2] But the rate of profit is a serious variable. It is a crucial determinant of capitalists' profit expectations. Production is organised and investment is undertaken by capitalists in order to make profits; a fall in the average rate of profit—and consequently in the expected profitability of new investment—is bound sooner or later to discourage such investment, and lead to a crisis. Unfortunately, much of economic theory, almost the entire volume of non-Marxian theory, is unaware of this simple truth of a capitalist economy. For example, in Keynes the rate of profit is conspicuous by absence.[3] In Walrasian general equilibrium it appears nowhere. In Solow-type neo-classical growth models it is at best a passive entity. Only in classical economics is the vital role of the profit rate duly recognised. Smith and Ricardo emphasise it as the prime determinant of investment, and so does Marx.

In the Marxian theory as it stands today there could be three sources for a fall in profit rate. We know, the rate of profit $r = e/(k + 1)$, where e is the rate of surplus value and k is the organic composition of capital. If c denotes constant capital, v variable capital, and s surplus value, then $e=s/v$, and $k=c/v$.

Now, r falls if:

(i) k rises, due to competition among capitalists. This is the argument originally given by Marx.[4]

(ii) e falls, because the workers extract higher wages raising v.

(iii) e falls, because the full surplus value s is not realised in the market due to deficiency of demand.

These variables are all measured in terms of Marxian value. One can also express them in terms of prices, and establish an approximate correspondence with the data given in a country's national accounts. This has been attempted by serveral authors in order to explain the observed fall in profit rate.

Of the three cases listed above, the first one is known as the hypothesis of rising composition of capital. In the major capitalist countries the capital-output ratio is fairly constant over time. This hypothesis has not received much blame for the declining profit rate.

The second hypothesis is quite popular (Weeks 1979). It goes by the name of rising strength of labour, or profit squeeze. It has been used to explain cyclical movement of profit rate in the United States (Boddy and Crotty 1975), and also the longer term trend in Britain (Glyn and Sutcliffe 1972) as well as in the United States (Crotty and Rapping 1976; Weisskopf 1979; Weisskopf, Bowles and Gordon 1985; Wolff 1986).

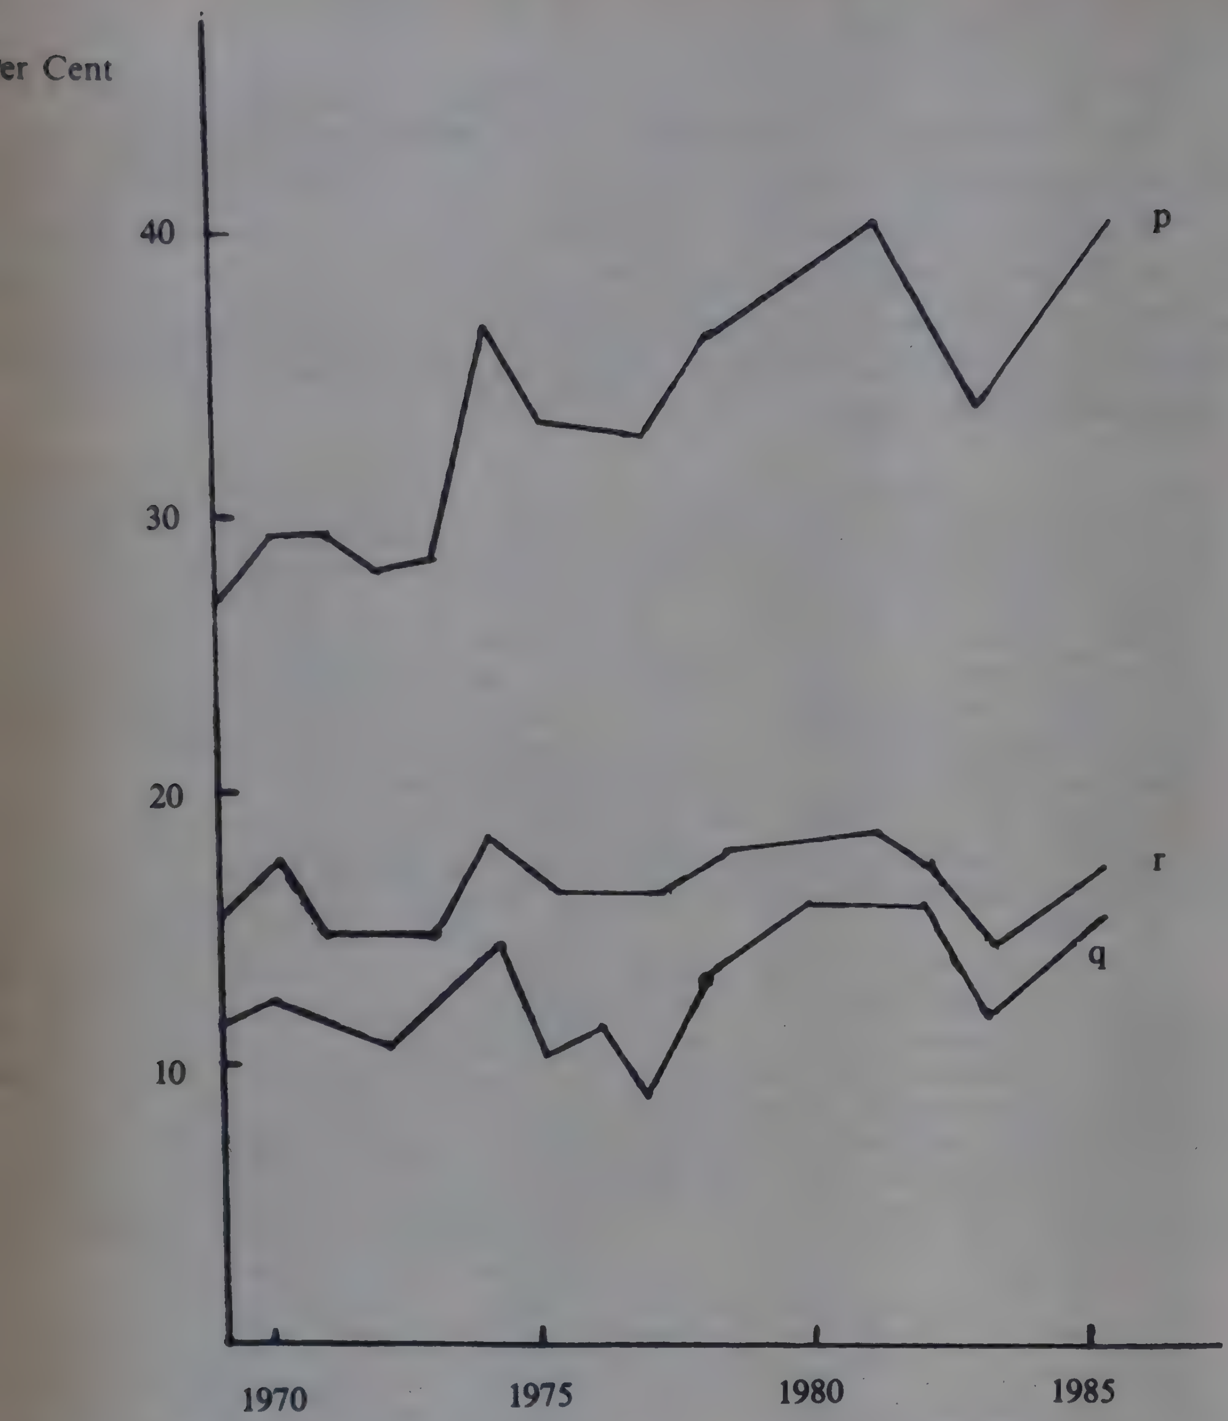
The third one is called realisation failur[e]. In this event, the law of value itself has faile[d] to hold due to either underconsumption [or] underinvestment, or sectoral dispropo[r]tionality (Sweezy 1942, ch 10). It can pr[o]vide the basis for theories of business cyc[les] (Kalecki 1971; Sherman 1976), as well as f[or] theories of long-term stagnation (Baran an[d] Sweezy 1966; Steindl 1952).

India is essentially a capitalist econom[y], albeit underdeveloped. And it is not a mino[r] one at that. It has a relatively, stron[g] industrial bourgeoisie. Its labour force (som[e] 23 million) in the organised sector is fairl[y] comparable with that in Britain, France, Germany or Japan. The top decile of it[s] population constitutes a powerful 'consum[]ing classe', almost equivalent to that i[n] western Europe. It is, therefore, not an idl[e] question to ask: Is the profit rate falling i[n] India's industry? This paper is intended t[o] raise and answer this question.

There is one more point. The Marxian theory of profit is originally cast in value terms. For empirical testing it is translated into prices, and the variables are identified with the data as of national accounts. Some distortion occurs in the process; but the practice is defended on the ground that "a relevant Marxian crisis theory must ultimately explain the behaviour of that profit rate... which is actually perceived by (and thus affects the behaviour of) capitalists themselves" (Weisskopf 1979: 343n). But there is a problem here. The task is correctly perceived, but incompletely accomplished. The profit rate, as actually computed by researchers, is a rate of return on capital which is essentially a macroeconomic concept. But a capitalist is more familiar with the language of the balance sheet, and the profit and loss statement, rather than that of macroeconomics. Hence the investigation must be carried further, from national accounts to another level, namely, the level of company accounts. This paper does it, but at some unavoidable cost due to the lack of relevant data.[5]

The Industrial Credit and Investment Corporation of India (ICICI) publishes annual financial statistics of a sample of 417 public limited companies in its portfolio.[6] These are some of the largest companies in the country, most of them belonging to the

FIGURE 1: RATES OF PROFIT



private corporate sector. The following analysis is based on the ICICI sample data.

I

The rate of profit can be defined in so many ways, depending upon the purpose at hand. From a capitalist's point of view the rate of profit (after tax) on net worth is an important index. The data in col 2 of the accompanying table do not show any strong trend either way; if anything, there is a mild upward tendency.

The seventeen-year period beginning 1969 witnessed the sprouting of the green revolution on the one hand and the onset of industrial deceleration on the other. Halfway, the initial impetus of the green revolution was exhausted. Subsequently, foodgrains output picked up, and the industrial growth rate improved. Over this entire period the rate of after-tax profit on networth fluctuated around a mildly upward trend (Figure 1).[7]

Does this mean that the law of falling tendency of the rate of profit has not yet come into force in India? Of course, the Marxian law is not directly concerned with the particular rate of profitability that we are considering at the moment. In any case it would be interesting to decompose this measure of profitability.

If q denotes the rate of after-tax profit on net worth, t the corporate tax rate, p gross profits (before interest and tax, but after depreciation) per unit of net worth, i the rate of interest, and d the debt-equity ratio, it can be shown that:[8]

$$q = (1 - t)(p - i\,d) \qquad \text{....(1)}$$

The relevant data for (1) are given in cols 3-6. We find that p, i and d have perceptible upward trends, while t first increased and then fell.

We now move to a level that has greater macroeconomic implication. Define capital as net fixed assets and inventory that appear in the balance sheet of a company. This is also the definition of capital in national accounts. The rate of gross profit on capital, denoted by r, is given in col 7.

There is a problem with the data here. Although the size of the sample is fairly constant (543 companies in 1969 and 1970, 421 in 1971, and 417 thereafter) the company-wise composition is not invariant over time. Hence a time series of real capital stock cannot be readily computed. The r that appears in col 7 is, therefore, not the real rate of return on capital; the effect of inflation is unavoidably mixed with it. The last column gives the figures of the rate of inflation. The problem is further compounded by the fact that in India the price of capital goods is known to have increased faster than the general price index.

In Figure 1 the three variables, p, q, and r, are plotted. Evidently, p has a discernible upward trend, r is rather steady, and q is fluctuating. The difference between r and q is largely accounted for by corporate tax.

Now, r can be decomposed as follows:

$$r = f\,y \qquad \text{....(2)}$$

where f is the share of gross profits in value added, and y is the ratio between value added and capital.[9] Therefore, col 8 multiplied with col 11 gives col 7. It is interesting to note that the share of gross profits in value added has a downward tendency (col 8). Gross profits, let us recall, include interest and tax also.

Does India's industry suffer from the problem of deficiency of demand, or the so-called realisation crisis? Since the rate of profit, however measured, has not shown any marked downward trend, one might say that for the large companies in the ICICI sample market has been no problem at all in the long run, although cyclical variations are not altogether ruled out. One way of formally incorporating the role of demand is to note that:

$$r = P/K = (P/Y)\,(Y/Y^*)\,(Y^*/K) \qquad \text{....(3)}$$

where p is gross profit, K capital, Y actual output or value added, and Y* is the capacity output. The ratio Y/Y* is an index of the rate of capacity utilisation. We have data of capacity utilisation for only a brief period, 1979-1985, which do not indicate any rise in the rate of excess capacity (col 12). Whether the current rate of capacity utilisation is satisfactory or not is, of course, a different matter.[10]

II

Value added is defined here to consist of three parts, namely, gross profits, wages and salary, and indirect business tax (excise).[11] Note that in national accounts indirect business taxes are included in NNP, though not in what is called national income, or NNP at factor cost. According to cols 8-10, the shares of the first two parts, that is, gross profits and wages and salary, in value added have gone down, while that of excise has risen.

Now, gross profits include direct tax also, in addition to interest and net profit. So the government acquires part of the value added in two ways: direct tax and indirect tax. The total share of the government thus went up from 0.42 to almost 0.48, and then declined slightly (col 13). The overall average pattern

of the distribution of income (value added) during 1969-1985 was as follows:

Tax (direct and indirect)	0.44
Wages and salary	0.35
Net profit and interest	0.21
	1.00

Thus, by far the largest of the three shares goes to the government. Since banks are nationalised, a portion of interests also may be said to find its way to the government. One might, therefore, conclude that about one half of the industrial income is extracted by the government one way or the other. If appropriation of surplus value is the definition of exploitation, then the government is apparently not a small exploiter. A theory of income distribution, under such circumstances, cannot ignore the role of the government. In this context see also Bardhan (1984), where the government bureaucracy is identified as a member of the dominant coalition of propertied classes that rules over the political economy of India.

In Figure 2 we have plotted the shares of the three components of value added, namely, (i) direct and indirect tax (ii) wages and salary, and (iii) net profit and interest. The curve of direct and indirect tax, after an initial dip, has remained rather horizontal. The other two curves point to a potentially deep-rooted conflict in the economy. the curve of wages and salary is going down, while that of net profit and interest is rising, as if to throw up a challenge. There is a widespread view that the overwhelming presence of the state as a 'third actor' on the scene of India's political economy has blunted the edges of classical class struggle between labour and capital (Rudolph and Rudolph 1987:20-25). The graphs of Figure 2 presumably have a different story. The rise of the share of net profit and interest at the cost of wages and salary indicates the existence of ground for a typical capitalist confrontation of classes.

As mentioned above, major capitalist economies around the world are in the midst of a deep crisis, the profit rate having fallen since the mid-sixties. Part of the explanation lies in the fact that the pressure of wages in those countries has mounted. Another factor has been at work, on the demand side. After the Korean war boom tapered off in the early fifties there was apprehension that stagnation would set in. The situation was saved largely by an unprecedented rise in the demand for consumer durables. Eventually it led to mounting household debt that in due course choked off consumer expenditure. Forces thus acting on both demand and cost sides resulted in the crisis of capitalism in those countries.

How is it that India could escape such denouement? The explanation seems to b rather obvious. In India's private industr the share of wages has gone down, allow ing the profit rate to climb. On the deman side, particularly for the products of th companies of our sample, there was no much of problem. The market for durabl consumer goods took shape, and continue to grow, largely supported by the ever expan ding wage and salary bill of governmen administration in particular.[12] The overal index of industrial production in the coun try decelerated during the seventies, n doubt; but that was due mainly to th maladies of capital goods industries whic belong, in the main, to the public sector Industries of durable consumer goods di not face any such trouble.

From this what can we say about the cur rent policy of so-called liberalisation? First the industrial bourgeoisie of India would welcome the government's evident shift toward consumerism, that is, promotion of industries that produce for the affluent 'middle class' consisting of the top decile of population. The household debt-trap, that has caught the consumers in the west, has not been in sight in India as yet. Second, while the bourgeoisie would prefer certain relaxation of controls of export, import and foreign technology and capital inflows, it is

TABLE

unlikely that they would enjoy much greater linking of the Indian economy with the ailing capitalism outside, lest their domestic market be eroded.

In view of the lately unfolding theory of chaos the possibility of persistently erratic movements of the economy, rather than smooth convergence to a classical stationary state, can no longer be ruled out a priori (Bhaduri and Harris 1987; Day 1982, 1983; Hicks and Hollander 1977).

Notes

[This paper is part of a research project sponsored by the Centre for Management and Development Studies, Indian Institute of Management, Calcutta, without assuming any responsibility for the findings.]

1 The falling rate of profit is a distinct feature of classical economics. To Adam Smith, accumulation of capital by itself lowers the rate of profit as it raises the wage. Ricardo considers the fall in profit to be a consequence of the law of diminishing returns in agriculture. However, it is Marx who deals with this issue at greater length; hence the law is associated with his name.

2 Okun and Perry (1970) discussed the fall in profit share in GNP after 1966 in the US. It gave rise to a debate at the Brookings Institution. Nordhaus (1974) argued that the cost of obtaining new capital since the war had notably decreased; by the late 1960s capital was in abundance. Thus the weakness in the profit rate, in his opinion, need not be seen as a problem. For subsequent contributions see Dumenil, Glick and Rangel 1987; Feldstein and Summers 1977; Lovell 1978.

3 Keynes is concerned, in the main, with the short run where the stock of capital is given. He does consider the volume of profit in the *Treatise* and the *General Theory*; hence the rate of profit may be said to have been implicitly taken into account. But the point is that the rate of profit does not play any role in his theory.

4 It can also be argued that k rises secularly as the capitalists resort to mechanisation for gaining greater control over the labour process (Braverman 1974; Gordon 1976; Shaikh 1978).

5 There are certain theoretical problems also; see Fisher 1984; Fisher and McGowan 1983; Harcourt 1965; Kay 1976.

6 For 1969-70 and 1970-71 the size of the sample is 543, and for 1971-72 it is 421. Although in the following years it remains constant at 417 the individual composition presumably changes. Data for a given year is often available from several annual publications; always we have taken the latest available figure.

As for the scope of the sample it is noted that these 417 companies accounted for nearly one half of the paid-up capital of non-government public limited companies at work in March 1986. When compared with the data published by the Annual Survey of Industries (ASI) on public limited companies in the private sector for the year 1981-82, these sample companies in that year accounted for 54 per cent of the productive capital, 54 per cent of the value added, and 49 per cent of the gross output.

7 Similar data published by the Reserve Bank of India for a larger sample of public limited companies and for a longer period indicate cycle rather than any clear trend (Sau 1988:790).

The RBI classifies the companies in terms of paid-up capital into three groups: small, medium, and large. The companies in the ICICI sample would presumably fall in the 'large' category in RBI's definition. These companies, in fact, may be the largest among the large ones. If so, it could be further confirmed from the RBI and ICICI data that the rate of profit varies directly with the size of the company.

8 Let E denote equity or net worth, P gross profits, and I interest. Then $q = (1-t)(P-I)/E$. But $I = i D$, $p = P/E$, and $d = D/e$. Hence (1).

9 Let K be capital, and Y value added. Then, $r = P/K = (P/Y)(Y/K)$. We have $f = P/Y$ and $y = Y/K$. Hence (2).

10 Reliable data for capacity utilisation for a longer period are simply not available. During 1961-64 the average rate of underutilisation of capacity was much higher than what we find in col 12 here for 1978-85 (Bhagwati and Srinivasan 1975: 183-91).

11 In some studies, for example, Weisskopf (1979:342n), indirect business tax is not included in value added.

12 According to national accounts, compensation of employees in public administration, defence, and other administrative departments of the government was Rs 2,301 crore in 1970-71 and Rs 15,686 crore in 1984-85. The corresponding figures for the entire organised private sector were respectively Rs 2,793 crore and Rs 14,031 crore.

A Compassionate Portrayal

S Akbar Zaidi

The Sole Spokesman: Jinnah, the Muslim League and the Demand for Pakistan, by Ayesha Jalal; Cambridge University Press, 1985; pp xvii + 310, £ 27.50.

THIS book by Ayesha Jalal is a truly brilliant achievement. It is an excellent example of the Cambridge University (where Jalal received her doctorate) school of thought in history, where, in the bourgeois tradition, individuals—'great' men, and less frequently, women—make history, determine the future of hundreds of millions and carve out new countries and nations from subcontinents. Mohammed Ali Jinnah is, for Jalal, that great man, who is crafty, careful, meticulous and most of all patient, who after a struggle for Muslim rights lasting more than four decades, ends up with a new country Pakistan, carved out of British India.

The Sole Spokesman is like a mystery novel, gripping and absorbing, with numerous twists and turns. The reader is introduced to Jinnah and gets involved in his political life from the mid-1930s to eventual partition in 1947. After a brief introduction about Jinnah and his political work in his earlier years, within a few pages of the book, we are in the thick of the nationalist movement following the Government of India Act of 1935. Jalal has discussed at great length the meaning and importance of the act to the provinces of British India and shows how the British very intelligently, under the guise of permitting provincial autonomy, further fortified their own rule: "encouraging provincial ambitions and keeping the centre firmly in British hands was not a strategy for getting out of India, but a way of staying on" and again: "The 1935 Act had provided the 'steel frame' which could preserve British rule in India".

The results of the 1937 elections following the 1935 Act give Jalal a first opportunity to discuss the political capabilities of Jinnah and we are privy to her view about the man who created Pakistan. In the elections, the Muslim League was severely thrashed and completely rejected by the electorate in Muslim majority areas: in the Punjab, the League won 1 out of 87 reserved Muslim seats, in Sind none of the 36, in NWFP none of 36 and in Bengal, only 37 of 119. This humiliation prompts Ayesha Jalal to say: "anyone except Jinnah would have been tempted to throw in the towel... But Jinnah was a fighter and he was the master of a long slow game, an expert at seeing chances in the worst reserves" (p 33). This view of Jalal that Jinnah was a brilliant tactician is one of the two primary theses and revelations in her book.

To Salman Rushdie, the Jinnah caricatured by Attenborough in his film *Gandhi* came across as a Draculaesque figure in more than just the physical sense. Unlike that blood-sucking vampire, Jalal paints a compassionate picture of a clear and skilful tactician who waits for the right moment and then makes his careful moves. She agrees with other "contemporaries and historians [who] have often described Jinnah as a player who kept his cards to his chest" and adds, "and a good player with a poor hand has to pretend to have different cards than those he is actually holding. So there is nothing surprising about Jinnah's inscrutability, or that the final result was so different from the one which he had so skilfully planned and fought so hard to achieve". And again, following critical negotiations with Wavell in September 1946, Jalal is led to say: "one clue to Jinnah's remarkable resilience in the face of grave political setbacks, overwhelming odds, and unremitting squeeze play, was his extraordinary capacity to fight when all would have appeared lost to lesser men". For Jalal this quality of perseverance and patience in Jinnah was a major factor in the creation of Pakistan.

The other major thesis in her book, one which is indeed a major revelation to most readers in Pakistan who have been fed lies by official spokesmen over the last decades, is that, Pakistan for Jinnah, did not mean the partition of India. In fact, what is most revealing is that the term and concept 'Pakistan' was never defined by any of the Muslim League leaders, least of all Jinnah. 'Pakistan' throughout the 1930s and 1940s (even up to 1947 itself) remains an abstract 'homeland for Muslims' with often vague and conflicting boundaries and with a clearly undefined constitutional status.

In April 1940, following the Lahore Resolution, I I Chundrigar, a very senior Muslim Leaguer, asserted that: "The object of the Lahore resolution was not to create 'Ulsters', but to achieve 'two nations welded into United India on the basis of equality'. Bold departure though it seemed to be, the resolution was hunting for an alternative to majority rule, not seeking to destroy the unity of India" (pp 70-71). H V Hodson, the reforms commissioner of the British government who visited India in late 1941 concluded in his report that "most Muslims with whom he had spoken, including orthodox supporters of Pakistan from Jinnah downwards, were thinking in terms of the British staying on ... Every Muslim Leaguer interpreted Pakistan as consistent with a confederation of India for common purposes like defence, provided the Hindu and Muslim element therein stood on equal terms" (p 70).

In August 1944 Jinnah gave a press statement to the newspaper *Nawai Waqt* in Lahore and the gist of the statement is quoted by Jalal as follows: "Jinnah's 'Pakistan' did not entail the partition of India; rather it meant its regeneration into an union where Pakistan and Hindustan would join to stand together proudly against the hostile world without. This was no clarion call of pan-Islam; this was no pitting Muslim India against Hindustan; rather it was a secular vision of a polity where there was a real political choice and safeguards, the India of Jinnah's dreams" (p 122). Mian Mumtaz Daultana, a senior politician from the Punjab, reminiscing about events in June 1946, also reaffirmed Jinnah's statement and said that "Jinnah never wanted a Pakistan which involved the partition of India and was all in favour of accepting the Cabinet Mission proposal" (p 202). Although the demand for 'Pakistan' had been made in the 1930s at the All India Muslim League Council Session held in Bombay in June 1946, Jalal writes that Jinnah was "unable still to define the demand for Pakistan precisely" (p 211). That is not all. Nazimuddin, a senior Bengali Muslim Leaguer even in February 1947, a few months before Pakistan was created, and when evidence of some sort of agreement about a Muslim homeland seemed almost obvious, "did not know what Pakistan meant, in fact nobody in the Muslim League knows"! (p 238). Three months before August 1947, in May, following negotiations with Mountbatten, Congress and Jinnah, Jalal concludes: "It was Congress that insisted on partition. It was Jinnah who was against partition".

This central thread in Jalal's thesis is indeed revealing and an eye-opener to most who have been brainwashed by official 'historians' in Pakistan, who have distorted facts to suit their own nefarious designs. The lack of clarity of the great Quaid-e-Azam and his coterie so convincingly illuminated by Jalal contradicts the official spokesmen in this country who have gone out of their way to show that a plan for an independent homeland for Muslims in India was designed as far back as the 19th century by Saiyyed Ahmed Khan and later echoed by Mohammed Iqbal in the early 1930s. True, there may have been some discontent and resentment against Hindu

domination amongst the nobility of some provinces of India. Jalal has shattered yet another myth when she meticulously demonstrates how it was the Muslim majority provinces which were, in fact, most allergic to 'Pakistán'.

It was mainly the four Muslim majority provinces, Punjab, Bengal, Sind and the NWFP which were most distant to the idea of a 'Pakistan'. 'Pakistan' seemed to be only the need and demand of a handful of the elite from the Muslim minority provinces with little support elsewhere. The League was humiliated in the 1937 elections and although it gained respectability in the 1945 elections, Jalal writes that as late as April 1946, there was no support for 'Pakistan' in the majority provinces. Sind and the NWFP wanted independence and not Pakistan. "In the NWFP, the Mission was bluntly told by the Congress chief minister, Dr. Khan Sahib, that the League did not represent Muslims. The Pathans had no love for their Punjabi neighbours. *They would never willingly join Pakistan*. They wanted no centre at all but they did not fear domination by a Hindu centre. *What they wanted most of all was to be entirely independent*" (p 181, my italics). The Punjabis wanted provincial autonomy, states' rights and a weak federal centre. "The chief minister of Sind, Ghulam Hussain, thought all would be well if only all-India politics could be kept out of the provinces, and in particular out of Sind" (p 180). He believed that "Sind must be left alone by all outsiders, whatever their faith" (p 180). The Bengali leadership fearing the partition of Bengal quite categorically said that "Bengal was Bengali, not Muslim" (p 180). This puts to rest a great deal of the nonsense and fiction espoused by appologists of the two nation theory. This is a major contribution to which we are thankful to Ayesha Jalal.

Since the League represented the aspirations and interests of the nobility of the Muslim minority provinces, its social programme and philosophy also reveal its true colours. In October 1937 Mohammed Iqbal

> was convinced that the League would now have to decide whether it will remain a body representing the upper classes of Indian Muslims or the Muslim masses who have so far, with good reason, taken no interest in it. The real issue as Iqbal saw it, was: 'how to solve the problem of Muslim poverty?' ...The only way to solve the problem of bread for Muslims was to enforce the 'Law of Islam'. A bold social and economic programme based on the 'Law of Islam' for the Muslim masses would, according to Iqbal, do the trick; but what such a 'Law' involved or how it could be implemented was not very clear, and in any case Jinnah was too shrewd and too secular to chase this particular hare. If the 'Law of Islam' was to be interpreted by the ulema, the traditional guardians of the law, Jinnah would certainly have nothing to do with it... Moreover, Jinnah could see that any appeal to religion, or to a radical economic programme, might only too easily boomerang on its proponents. *The League could not even begin to set out a plausible facsimile of a programme to eradicate Muslim poverty since such support as it possessed came from vested landed and business interests at the apex of society*. In any event, such appeals were irrelevant to Jinnah's predicament (p 42-43, my italics).

In October 1944, Abdus Sattar Niazi (a senior Leaguer from Punjab) called a meeting in Lahore to discuss making Pakistan an Islamic state. The *Civil and Military Gazette* saw this as "an open rebellion against Jinnah and the League" Earlier in April 1943 at the League's Delhi session, "a resolution which would have committed the League to basing the future constitution of Pakistan on Islamic principles was quietly withdrawn at Jinnah's insistence" (p 96). Yet another myth propagated by the official media in Pakistan is buried by Jalal.

There are certain minor points of importance which further help in making *The Sole Spokesman* the masterpiece it is. The role of Mountbatten is shown to be very partisan in his dealings with the final process of partition. Mountbatten considered Jinnah, at various times, a 'lunatic', 'bastard', 'evil genius' and 'psychopathic case'. Given this perception, it is not surprising that in the last crucial days, Mountbatten, time and time again took Nehru into his confidence. As Jalal argues, repeatedly "Mountbatten failed to observe protocol or the pretence of impartiality. It had been agreed to show the plan simultaneously to all the political leaders. But Mountbatten—in an 'act of friendship'—showed Nehru the plan on the condition that he would not discuss it with his Congress colleagues, and kept the plan away from Jinnah" (p 272). It was due to Mountbatten's intense dislike towards Jinnah that Nehru, Congress and India were repeatedly given the benefit of the doubt when it came to critical issues concerning the partition of India.

Ayesha Jalal has also highlighted the dynamics of the Muslim majority provinces in great detail and has analysed their relations with the central offices of the League and with Jinnah himself. Her understanding of local politics is quite impressive and her reading of the Punjab, later Pakistan's most populous, powerful and influential province, is interesting. Time and again she talks of the Punjab's "traditional opportunism" and how the leaders of the province would frequently sell to the highest bidder: "As long ago as the days, good or bad, of Ranjit Singh, who knew his Punjab, the big families had survived the vicissitudes of change at the top, in court and darbar, by knowing when expediency demanded them to be turncoats—an old Punjabi tradition, alive and well to this day. Once the unionists were deemed no longer the best security for their local interests, the landlords and pirs were ready to call in new patrons" (p 143-44). Evidently not only Ranjit Singh but Jalal too knows her Punjab well.

There are a few criticisms of this otherwise excellent achievement. First, there is the broader issue of ideology and the question: What is history? Is history made by a dozen politicians who are articulate and convincing negotiators? Or is it made by people, by productive forces and by a wide canvas on which economic forces dominate? Clearly, Cambridge University subscribes to the former school which this reviewer rejects. Nevertheless, within the bourgeois paradigm, this book is supreme. There is then the essential question: what made Jinnah tick? Why was he so single minded, resolute, determined? Why did he want Pakistan? For Whom? Was it power, or just an intellectual and political challenge? One searches for answers to these questions but fails to find any. A third criticism of the work deals with an apparent contradiction in Jalal's analysis. She has portrayed Jinnah as a brilliant tactician and negotiator who usually won. But the final settlement by Mountbatten was indeed defeat for Jinnah, and Jalal too concedes this point. Mountbatten ruthlessly outwits and humiliates Jinnah into submission and acceptance of a "motheaten" Pakistan. So, did he reallly succeed after all?

With the publication of this work dealing with Jinnah and the freedom struggle for Pakistan, Ayesha Jalal has established herself as an outstanding Pakistani historian dealing with that era. She has filled the space which was occupied previously by sycophants and official scribes who posed as historians. Indeed, this masterpiece will herald her as a major Pakistani social scientist of international repute and clout. It is no longer possible to write about either Jinnah's politics or the question of partition without a thorough reading of Ayesha Jalal's definitive book. She also has the advantage of being a very gifted writer with supreme command over the subject and over the English language, a rare combination amongst Pakistani scholars. Indeed, with this background, one looks forward eagerly to her future works.

Ahmadi Movement: Resolving Some Confusions

Asghar Ali Engineer

Prophecy Continued—Aspects of Ahmadi Religious Thought and Its Medieval Background by Yohanan Friedmann; Oxford University Press 1988; pp xiii + 218, Rs 175.

AFTER the Isma'ili movement the most controversial movement in Islam has been the Ahmadiya movement. The former originated in the second century of the Islamic era and it was influenced by the Greek thought and philosophy. The Ahmadi movement, on the other hand originated in the 13th century of Islamic era, its founder was an Indian and it was a religious response to the western Christian mode of thought sought to be imposed in India. Both these movements represented heterodoxies in Islam. Both were attacked and persecuted by the orthodox Muslims. However, while the orthodox theologians have seemed to be reconciled to Isma'ilism of late, the Ahmadis are still under intense fire throughout the Islamic world. The reason for this irreconcilable attitude towards the Ahmadis is the perception—which is not altogether false—that the followers of the Ahmadi sect do not believe in the finality of the prophethood of Muhammad.

There is a great deal of confusion of thought as far as Ahmadis are concerned. There are claims and counter-claims. The need for an objective and systematic study has long been felt for quite sometime. The confusion has been caused both by Ahmadis themselves as much as by their orthodox rivals from amongst the Muslims. Yohanan Friedmann's study is all the more important as the Ahmadi sect is the latest to appear on the religious horizon of Islam. Also, this sect, again like the Isma'ilis, has been most organised, vigorous and dynamic. No one but the most prejudiced can deny their contribution to the spread of the Ahmadi version of Islam and their establishment of Islamic centres in various parts of the world, especially in Europe and America.

The book is divided into four parts; part one has one chapter, two and three have three chapters each and part four has two chapters. The first chapter of part one deals with the history of the Ahmadiya movement. Ghulam Ahmad, its founder, was born in the late 1830s in a village in Punjab called Qadiyan. Ghulam Ahmad invited people to pledge allegiance to him towards the end of 1888 with a claim to a revelation in Arabic which said, "If you made up your mind, trust Allah. Mark the ark under our eyes and as we reveal. Those who pledge allegiance to you, really pledge allegiance to Allah. Allah's hand is over their hands."

Parts of these revelation are identical with the Quranic verses. Several of Ghulam Ahmad's revelations had this quality. The first ceremony of initiation took place in 1889 in Ludhiyana in Punjab. The Ahmadiya as an organisation was thus established. From 1889 annual gatherings began to take place in Qadiyan where Ghulam Ahmad delivered religious sermons. At these gatherings plans were also made for missionary activities in Europe and America. Ghulam Ahmad also followed the method of issuing challenges to Muslims, Christians and Hindus for debate on various controversial issues.

It would be seen that the controversies were mainly of theological and not social or economic nature. This was limitation as well as the strength of Ghulam Ahmad. Also, Ghulam Ahmad's own theological contribution was not of novel nature. He stuck to mainly orthodox dogmas except on the question of Jesus' death, termination of revelation with the death of Prophet Muhammad and the nature of *jihad*. Ghulam Ahmad did not believe in the traditional concept of *jihad*, i e, waging war with sword. Neither did he support the idea of fighting against the British. It was under the influence of the ideas of Ghulam Ahmad that a noble in the court of the Afghan King Abd al-Latif spoke publicly about the illegality of waging war against the British, who, he said, afforded protection and security to millions of Muslims under their rule. For his views on this issue he was put to death in 1901 by the Amir Abdal Rahman, who entertained pan-Islamic sentiments and had published a few years earlier, a pamphlet advocating *jihad*. It would be interesting to note that even in India the orthodox *'ulama* advocated *jihad* against the British imperialists and issued *fatwas* instructing Indian Muslims to wage *jihad* against the British and join hands with their Hindu brethren to throw them out of India.

When Ahmadis suffered persecution in Afghanistan, many were imprisoned and two of them were executed, the Afghan authorities received full support from the Indian *'ulama*. Shabbir Ahmad Uthmani of Deoband published in October 1924 a book in which he argued that the Ahmadis were apostates. He also surveyed the *shar'i* injunctions on apostacy and reached the conclusion that in Islamic law it carried the death penalty and thereby justified the punishment inflicted on the Afghan Ahmadis. This book, it is interesting to note, was again published after partition and was used as anti-Ahmadi *fatwa* during the anti-Ahmadi disturbances in Pakistan in 1953.

The author has devoted one full chapter to Ghulam Ahmad's idea of *jihad*. The author rightly maintains that the rein[terpretation] pretation of the idea of *jihad* is one of [the] main themes of Ahmadi religious thou[ght.] Ghulam Ahmad's book *Governmen[t] Angrezi awr Jihad* (*The British Governm[ent] and Jihad*) has been entirely devoted to [it.] The author points out: "The centrality [of] this theme in Ahmadi thought is eviden[tly] related to Ghulam Ahmad's involvement [in] polemics against the Christian missionar[ies] and members of Arya Samaj. As we ha[ve] seen above, both groups used the idea [of] *jihad* to describe Islam in an unfavourab[le] aggressive light. Ghulam Ahmad was co[n]vinced that the *'ulama* who cling to the tra[di]tional interpretation of the idea, and speci[al]ly those who propagate the traditions abo[ut] the 'bloody mahdi' expected to come a[nd] eradicate the infidels, supply the enemies [of] Islam with an effective weapon."

Ghulam Ahmad was convinced that All[ah] entrusted him with the task of restoring t[he] idea to its original form in order to defe[nd] Islam against the attack. According [to] Ghulam Ahmad the commandment of *jih[ad]* came into being only as a result of the gre[at] dangers that Islam faced in the first year [of] its existence. He also quotes the Quran[ic] verses 22-39 in which Allah says "Permi[s]sion (to fight) is given to those who a[re] fought against because they were wronge[d] and Allah is capable of helping them." H[e] thus proves his point about the defensi[ve] nature of *jihad* in Islam.

The most interesting and scholarly pa[rt] of the book is the one dealing with the co[n]cept of the finality of prophethood. Ghula[m] Ahmad sent ripples of shock by claimin[g] himself to the *mujaddid* (renewer of faith) *muhaddath* (one who is spoken to by Allah) and *mahdi*, the messiah. In the chapter 'Th[e] Finality of the Prophethood', Friedman[n] examines in great detail the entire hadit[h] literature and its various aspects on the con[]cept of *nubuwwah* (prophethood).

As it has happened with other religions Ahmadi religion also got divided into tw[o] principal sects on the death of Mirz[a] Ghulam Ahmad, Lahoris and Qadiyanis. This doctrinal divide has been extensively discussed in the book. The Lahoris have pro[]duced many notable figures and learne[d] scholars. The Lahoris have taken an unam[]biguous stand that Mirza Ghulam Ahmad was not a prophet. They quote the Mirz[a] who had reportedly said in 1891 that any prophetic claimant who emerged after the death of Muhammad is a liar and an infidel. However, they accept him as 'shadowy' prophet, quoting the later views of Mirz[a] Ghulam Ahmad and maintaining tha[t] shadowy prophets have not ceased to appear in the Muslim community after Muhammad's death.

The book deserves serious attention of scholars who wish to understand various views on the dogma of the finality of prophethood in Islam. The production is also first class and the Arabic transliterations quite flawless, a difficult feat to achieve.

Made in India: The Challenge

Excerpts from the speech of Shri J.N. Sapru, Chairman, I.T.C. Limited, at the 78th Annual General Meeting held on 27.6.1989.

Shri J.N. Sapru

THE INDIAN ECONOMY

Recent assessment of our economic progress indicates that in 1988-89 the growth in our Gross Domestic Product has been in excess of 11%, with agriculture growing at 20% and the industrial and service sectors growing at 8% each. This performance underscores the basic resilience and vigour of the Indian economy, which has emerged stronger even after successive droughts, and reflects favourably on the measures initiated by Government in recent years to encourage industrial and economic growth.

Despite the balance-of-payment crunch facing the country, the overall performance of the economy brings out the optimist in me. Having achieved the 'commanding heights' in the public sector, it is now time to pause, reflect and re-assess whether this good old order should not give way to the new.

The achievement of our objective of 6% growth in the Eighth Plan, enjoins on industry a growth commitment of 12%, coupled with at least a 10% growth in real terms of exports. We must actualise these aspirations, and take a significant step forward towards combating an old and tenacious adversary of our society—poverty. Indian industry will have to start becoming socially more responsive and internationally cost-competitive.

PERFORMANCE HIGHLIGHTS

Echoing the performance of the country's economy, your Company has completed another good year in terms of working results, posting a net income of Rs 364.36 crores, profit before tax of Rs 47.21 crores and profit after tax of Rs 29.20 crores.

On an annualised basis, the nine months' results reflect a 27.5% growth in net income and an increase of 33.5% and 57% in profit before tax and profit after tax, respectively. More than the returns in a particular year, it is the consistency of performance that more truly reflects the value of your Corporation. Your Board has thought it prudent to recommend a Dividend of 40% and capitalisation of reserves by issuance of Bonus Shares in the proportion of 1:1, subject to the approval of the Controller of Capital Issues.

The Report of the Directors gives you a fairly detailed view of the Company's performance. I will therefore dwell only on a few salient aspects that may be considered noteworthy.

1. Foreign Exchange

Your Company is one of the largest foreign exchange earners for the country in the private sector. Direct inflow of foreign exchange earnings of Rs 56.13 crores during this financial period reflects a 43% increase on an annualised basis and covers outflows five times. They also represent 15.4% of your net sales income.

2. Agri-businesses

Whilst all our business activities are progressing satisfactorily and continue to maintain their leadership, I am particularly happy to report the progress made by your Company's newest area of business activity. Different varieties of oilseeds under the brand name ADARSH have been enthusiastically received by the agricultural community in Andhra Pradesh and the market response to the SUNDROP range of cooking oils launched in the cities of Visakhapatnam, Madras, Hyderabad, Bangalore and Calcutta has been equally heartening. Significant progress has already been made in the development of hybrid seeds and I am pleased to advise that the Ministry of Science & Technology, Government of India, has accorded approval to your Company's Research & Development centre for oilseeds.

3. Punjab Anand Batteries Ltd (PABL)

At the behest of the Government of Punjab, your Company was invited to consider the revival of PABL. Under a Scheme of Rehabilitation approved by the Board for Industrial & Financial Reconstruction, your Company proposes to make an investment of Rs 1.19 crores by subscribing for 11,90,000 shares of Rs 10 each for cash at par. This will bring your Company's shareholding to 50% and I recommend this for your approval. It will take a few years to nurse this Company back to a state of health but I am sure you will be happy with this mark of confidence in the management of your Company.

4. Family Welfare—FICCI Award

I am pleased to advise that, in recognition of our achievements and active participation for over two decades in the Government's Family Health and Welfare programme, your Company has been given the prestigious Federation of Indian Chambers of Commerce and Industry (FICCI) Award for 1988.

EXCISE

The present position with regard to our disputes with the Central Board of Excise & Customs, spanning a period of over 15 years, has been explained in detail in the Report of the Directors before you. The status of this issue remains as reported last year, except that the Government has now transferred the adjudication from the Director General of Anti-Evasion (Central Excise) to the Director General of Inspection and Audit (Customs & Central Excise) along with all other cases pertaining to the cigarette industry as a whole, pending resolution since 1973.

I take this opportunity to reiterate that your Company has not ever evaded excise duties, nor knowingly transgressed the law. In the opinion of your Directors, your Company accepts no further liabilities in respect of the disputed issues and will continue to take all appropriate steps for their early and satisfactory resolution.

FUTURE PROSPECTS

Indications at the end of the first quarter reflect a very satisfactory growth over the record performance of last year. All our businesses continue to do well and, barring unforeseen circumstances, you can look forward to another year of improved performance.

MADE IN INDIA: THE CHALLENGE

The achievements these statistics reflect may make us sanguine, but we must not be

blinded into believing that we are on a natural growth escalator which will automatically take us to greater heights without much effort. We must address ourselves to two key issues, namely:

i. Social Responsibility

ii. International Cost-competitiveness.

If we are to continue to 'breast the tape' in the years ahead, we must reorientate our purposes and strategies in the perspective of these two dimensions.

i. Social Responsibility

Social responsibility is inextricably linked to the concept of cost-competitiveness, for it is no more a mere matter of making random and token contributions to social causes. Social responsibility is an integral part of corporate strategy.

The very existence of enterprise cannot be justified on the basis that it is good for business. The existence of enterprise can only be justified on the basis that it is good for society. We exist by societal sanction and must, therefore, always integrate our objectives with the larger good of society, not as a measure of patronage, or even philanthropy, but in businesses' own enlightened self-interest.

The premier social responsibility of business is to make a profit, and profit is not a dirty word. Allow me to reiterate what I said last year, "Bankrupt businesses do not create a prosperous nation." The interests of our stakeholders and, in a more comprehensive sense, the health of our economy does depend on the profitability and productivity of our investments. Not to create a surplus is not only an irresponsible act but a crime against society, more especially in a developing country where capital is scarce and the compulsions of poverty are sometimes terrible but always compelling.

However, though profits are fundamental to a corporation being socially responsible, profiteering is anathema to the concept. We cannot therefore allow all 'responsibility', 'morality' and 'conscience' to lie in the 'invisible hand' of an imperfect market system.

Your Company will continue to enact and implement measures in confirmation of its role as a 'responsible citizen' in its relationships with shareholders, business associates, suppliers, employees, customers, the Government and other relevant publics.

The courageous initiatives of the Government in unleashing the forces of growth and competition deserves reciprocal support from industry. In this context your Corporation will always act with sensitivity and in conscience, being aware that a 'responsible citizen' is an integral part of being a 'good corporate citizen'.

ii. International Cost-competitiveness

Let us now shift the focus to the second issue. The delinking of currencies from fixed rates of exchange, two successive 'oil crises' and the emergence of new economic 'superpowers' and companies within them of international commercial salience rocked the old system, and underscored the basic interdependence of the world's economy. In the common pursuit of improving standards of living, and the quality of life, nations have started agglomerating into larger 'economic communities' to create an environment and circumstance where the relentless demand for better quality and lower costs can be satisfied. The strategic issues for corporations today are not only focussed on 'economies of scale' but also on 'economies of scope'. Throughout the world, corporations are readjusting their activities and perspectives in the context of the 'globalisation' of markets, financial resources, and production and manufacturing systems.

In India, thus far, we have remained relatively protected and have not as yet felt the invigorating challenge of international competition. We have often, therefore, rationalised and shown misplaced sympathy for incompetence and inefficiency. This has extorted its toll on our economy, and sometimes resulted in a high-cost, low-value addition circumstance, which has tended to short-change our own people. But as the future unfolds, it is unlikely that we can achieve our aspirations in terms of economic progress and remain estranged from the challenges and opportunities posed by global economic phenomena.

Time has come when we should reassess our thinking on regulations and reservations and instead give serious consideration to development and growth, cost-competitiveness and quality. We have created too many artificial antagonisms of large, medium, small and even tiny sectors in our economy, which we have tried to insulate from each other without quite appreciating their interdependence and complementarity, and the long-term consequences of protectionism.

We must develop our pride in 'Made in India', and this can only happen when we compete internationally on dimensions of cost and quality. Therefore, let us think of the efficient and the inefficient sectors rather than of the large, medium and small.

It is the contention that the same factors of production—men, machines, materials and money—and the same work-culture cannot successfully produce two different qualities, one for the internal market and yet another for the international market.

As business gets 'globalised', your Company will invest in contemporary technologies and techniques. It will create the necessary totality of 'culture' to meet new challenges to deliver internationally cost-competitive value uniformly to its customers. These measures will give a competitive edge to your Corporation.

ITC's strategic direction will be towards becoming an 'Indian International' in form and spirit and, in so doing, it will continue to generate returns to its stakeholders, and contribute to national wealth and the quality of life in the immediate and the longer time horizon.

CONCLUSION

In conclusion, let us recapitulate. Whereas we can derive satisfaction from progress made as a country and a Company, international economic changes are creating 'new horizons' of challenge and opportunity.

For nigh on to four score years the ITC story has been one of managing challenge and change. We now approach the 'new horizons' with confidence founded in our abilities, taking sustenance from our history.

The challenge we therefore face as industry leaders and must resolve to establish is our pride in the stamp—Made in India.

This does not purport to be a report of the proceedings of the 78th Annual General Meeting.

NOTICE

It is hereby notified for the information of the public that **IMPEX (INDIA) LIMITED** proposes to make an application to Central Government in the Department of Company Affairs, New Delhi, under sub-section (4) of section 23 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to take over the whole or part of J.K. Telecom Limited.

Brief particulars of the proposal are as under:-

i) Name and address of the applicant:

Impex (India) Limited,
New Hind House,
3, Narottam Morarjee Marg,
Ballard Estate,
Bombay 400 038.

ii) Name and address of the undertaking the whole or part of which is proposed to be taken over and the manner of take over, i.e., by acquisition of shares, acquisition of control or management, whether by the acquisition of the ownership of the undertaking or under any mortgage, lease or licence or under any agreement or other arrangement:

J.K. Telecom Limited,
T & D Centre Building,
Rangreth Electronic Complex,
Badgam, Srinagar.

This is a Joint Sector Company promoted by J & K State Industrial Development Corporation Limited and Impex (India) Limited to execute the project for manufacturing 50,000 lines per annum of EPABX/RAX. As per the Shareholders Agreement dated 12th October 1987 between the promoters, 51% of the total equity capital is to be subscribed by J & K SIDCO and 49% of the equity capital to be subscribed by the applicant.

iii) Management structure of the applicant:

The Company is managed by the Board of Directors, Chaired by Shri Ajaypat Singhania.

iv) Capital structure of

a) The applicant:

Subscribed and paid up capital		
3000 Cumulative Performance Shares of Rs 100 each	... ...	Rs 3.00 lacs
4,67,600 Equity Shares of Rs 10 each	... ...	Rs 46.76 lacs
Total	... ...	Rs 49.76 lacs

b) The undertaking proposed to be taken over:

Proposed equity Share Capital		
3,21,000 Equity Shares of Rs 10 each	... ...	Rs 32.10 lacs
To be subscribed by:		
J&K SIDCO — 51%	... ...	Rs 16.38 lacs
Impex (India) Ltd. — 49%	... ...	Rs 15.72 lacs
Total	... ...	Rs 32.10 lacs

v) Line(s) of business of the undertaking which will or is likely to emerge as a result of the proposed take over:

The proposal is merely to subscribe for 49% of the Equity Share Capital to be issued by J.K. Telecom Limited as per the Shareholders Agreement. No change in the lines of business is envisaged.

vi) Consideration for the take over:

The shares shall be issued for cash at par.

vii) Scheme of finance indicating the source(s) of finance for the proposed take over:

Both the promoters have incurred expenditure/advance monies towards implementation of the project which will be adjusted by issue of shares to the above extent. Amount spent/advanced over and above the respective promoters equity contribution shall be refunded in due course by J.K. Telecom Limited.

2 Any persons interested in the matter may make a representation to Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, Dr. Rajendra Prasad Road, New Delhi, within 14 days from the date of publication of this notice intimating his views on the proposal and indicating the nature of his interest therein.

For **IMPEX (INDIA) LIMITED**

Dated this 29th day of July 1989

P. R. JAIN
DIRECTOR

Investment in Literacy for a High-Technology Society

Tapas Majumdar

Literacy and modernisation are conceptually interrelated and, therefore, their pursuit should be also interdependent. Yet the two movements appear to be proceeding in their respective 'self-reliant' ways. This paper tries to talk about the interrelationship and the interdependence, chiefly from the economist's point of view.

TWO movements in human resource development occupy the centre stage today in most south Asian economies and particularly visibly so in the large population economies like India. One is the old movement for the still remote goal of universal literacy that has now gained a new urgency. The other is a comparatively new (or emerging) movement, gaining ground everyday, for what may be called scientific modernisation of society. This movement too reflects a special urgency among the developing countries for securing a place in the sun in the twenty-first century—a century that is seemingly destined to begin as an era of high technology and high hopes at least for economies that are (or can be) endowed with abundant human if not material capital.

Literacy and modernisation are conceptually interrelated and, therefore, their pursuit should be also interdependent. Yet the two movements appear to be proceeding in their respective 'self-reliant' ways. This paper tries to talk about the interrelationship and the interdependence chiefly from the economist's point of view. While writing it, however, I have been inevitably made conscious of many other points of view too, not the least those of the sociologist and the political scientist.

Economics of Education

It is easy to see education as an economic activity at least in the simple sense that it calls for rational allocation of scarce economic resources. Arguably, it produces a good or goods that we want and are prepared to make some sacrifices for in order to possess. But anyone trying to work out the economics of this activity would immediately discover a number of peculiarities that mark out education—and more prominently, education for literacy—from the more common kinds of economic activities. Since the differentness of human capital formation is an implicit theme of this brief essay I may begin by talking about it first. I propose to refer for that purpose to three simple propositions that are basic to the understanding of this differentness.

Proposition 1: Learning as an activity implies the learner's own investment in time and effort

The main point of this proposition is that no one can buy instant education. So long as instant education remains unavailable in the market—which is likely to be the case so long as definitions are not changed—there has to be a minimum time-and-effort cost of buying a given quantum of education (given, that is, in type, quality and length of time), which would distinguish it from buying most other kinds of consumer or capital goods in the market.

The proposition that education necessarily implies the learner's investment in time and effort is thus stronger than the one that merely says that a rational human being invests in education and thereby in human capital the same way as one would invest in any other kind of capital, physical or financial.

It may be noted that the learner's investment is essential, but it is still only one part of society's investment in education. The other part is provided through a set of activities that can generally be described under the heading of 'teaching' as contrasted to learning. I have elsewhere (Majumdar, 1983) described investment in education as a composite two-part, two-domain investment. One part is the investment of the learners in their individual domain. The other part is the investment of the providers of education in the institutional domain. The two kinds of investment in the two domains are different, but they have to match in time and effort (and other resources) to make sense.

Proposition 2: Human capital, once acquired, cannot be transfered the same way as other capital or inventory

This proposition can be elaborated in two parts. The first part simply follows from Proposition 1. Since acquiring of human capital is necessarily time-and-effort consuming there can be no instant transfer because the transferee will need time and effort to receive the transfer.

The second part of the argument arises out of the idea of domain distinction in investment in education that I talked about, separating investment in teaching (in the institutional domain) from investment in learning (in the individual domain). There has to be investment of both kinds for a transfer of human capital to take place and teaching, like learning, implies time. Presumably it also implies effort—of a kind.

It should, moreover, be noted here that the transfer of human capital exhibits another peculiarity that almost violates the conservation law of economics and sets human capital apart from every other form of capital: its transfer does not deplete the original stock. In fact, there even exists the liberal myth that teaching increases the teacher's stock of learning! This 'counter-economic' characteristic has obvious beneficial effect on the cost of education particularly at the level of the spread of literacy where the time-and-effort cost of *teaching* is not particularly high.

Proposition 3: Most kinds of educational activity are sequential—literacy, by definition, being the first step in a sequence

Though this is perhaps the simplest of the three propositions, economists need to ponder at least two of its implications carefully. Many of our operational judgments in the area of investment in education will be found to be vitally connected with these implications.

First is the logic of the educational pyramid. The familiar hierarchical structure of formal education is provided by the sequence of primary, secondary and tertiary education with literacy at the bottom and higher research at the top. The philosophy of non-formal and continuing education challenges mostly the rigidity of the structure but not necessarily the sequential nature of most kinds of educational activity.

This implies that the costs and returns of an educational activity have to be calculated taking into account not only the scenario where it is an end in itself but also ones in which it is expected to lead to certain subsequent steps in education. The calculation of costs and returns of a certain type of literacy movement, for example, may depend on the extent to which the particular type of literacy envisaged would be favourable to the emergence of the supply of a given type of technical manpower for the economy. In other words, the calculations may depend not only on what good literacy of a given type does by itself but also on what good the supply of scientists, for example, that is expected to flow from that type of literacy would do to the economy.

The second implication of the proposition is that literacy, the first step, has to be defined in relation to the subsequent steps.

It may not always (or ever) happen that the first step would be the same irrespective of the subsequent ones that may be envisaged.

Literacy

Kuhn (1962) once distinguished between two kinds of progress in the natural sciences: normal and revolutionary. When we have progress of the normal kind there can be change, even rapid change, in the state of the art of a discipline but there are no changes in the accepted paradigms. It is as if the stock of knowledge, while it is being added to, is nevertheless built around, or built upwards on, certain existing premises. For this kind of progress the prerequisites for higher knowledge—at least the first prerequisite that we called literacy—would remain unaltered. Normal progress in science then is visualised as being based on fundamentals that either do not yet need to be questioned or at least have not yet been successfully challenged.

Contrasted to normal changes are changes of what Kuhn called the revolutionary kind that flow from the abandonment of many of the old premises. With such changes new and hitherto unsuspected areas of inquiry emerge, new questions become relevant and are asked, and new answers are found. In revolutionary times new scientific disciplines emerge breaking hitherto accepted jurisdictional barriers of old disciplines. Old disciplines often even acquire newer connotations.

What happens to the natural sciences happens, in different ways presumably, to other branches of knowledge as well. And in course of time, sooner or later, society and the economy accept these responses in the body of knowledge as relevant to the needs of the times. By this I mean that the need of the new knowledge base as prerequisite to entry into the new technology-oriented occupations eventually gets articulated. The required qualifications for many new jobs as well as the revised requirements of some old ones become thereby related to the new knowledge.

With such drastic changes in the required qualifications the prerequisites for many courses of learning are also equally drastically changed. In fact, the time then comes for educators to realise that even the idea of what constitutes literacy—the first prerequisite of sequential learning—has to be re-examined from the point of view of the new requirements. Perhaps such a re-examination has become due in our society today for the presumption is that high technology of a revolutionary kind appears to be bearing down upon us with all the semblance of inevitability. It is possible that the re-examination will indicate that the idea of literacy for the modern age needs to be extended beyond its classical definition in terms of learning and using the literary alphabet. The idea of literacy in the more profound sense had, of course, always been related to or even interpreted essentially as learning to live in society. The new literacy definition too, then has to relate to and be interpreted as learning to live in the new high-technology environment of modern society.

Two Reasons

Much is known and much more has been written about why literacy, defined appropriately for the age, is good for everybody. Without further reference to the rich and extensive literature on the subject spanning many disciplines, I would merely note that there are basically two aspects of the 'person in the street', or Everyman, that education at the level of literacy is meant to address. The first aspect concerns Everyman's role as productive agent. The second aspect concerns Everyman's way of life as citizen and consumer.

The social concern, it is to be presumed, will be for both aspects. Society, in other words, would be interested in linking literacy both to (a) the preparations that have to be made for obtaining an adequate supply of qualified manpower for the productive needs of the economy, and (b) the preparations that have to be made for permitting the 'person in the street' to enjoy an enhanced quality of life living in (and adjusting to) a complex high-technology society.

Economists usually talk directly and freely about the first aspect, but only implicitly and guardedly about the second, if at all. The source of the economists' inhibitions in dealing with the interaction between literacy (or education) and the quality of life is not far to seek: the economist's usually accepted paradigm of consumer behaviour cannot easily accommodate it. The individual preference relations that the economist defines are not conceived to be capable of being changed consciously and deliberately through education. The assumed rationality of the individual falls short of the rationality of *changing* preferences (see Majumdar 1980) while that precisely may be what education, at least at the level of literacy, is all about.

It is this consumer or citizen's role aspect, however, that attracted Herbert Simon's (1985) attention as he discussed the concepts of scientific literacy for Everyman whom he called, following Lillian Lieber (1942), The Celebrated Man In The Street or T C Mits. Only changing with the times, Lieber's 'man' becomes for Simon (as for us in this paper), a 'person' (i e, the German 'mensch').

In this brief paper I have in mind mainly Simon's concern. Therefore, I too will deal with the quality of life aspect of T C Mits who has to learn how to live in a high-technology society. But I will come to that concern only after spending a few words on the first aspect, which relates to the productive efficiency of T C Mits and to society's need for that efficiency. This I consider necessary because there is an interconnectedness between the two aspects.

One could perhaps take the position that what was involved in the idea of universalisation of literacy (of the relevant type) was actually a question of equity rather than of efficiency. How many in society ought to be provided with a given type of literacy depended on what society's equity goals were. But how many literates of that type society actually needed keeping in view its technical manpower requirements was, on the other hand, a question of economic efficiency and depended on positive, rather than normative economic conditions. One could then reasonably say that it was the positive second question that was related to the productive efficiency aspect of Everyman from the point of view of society while the normative first question was related to Everyman's quality of life in the economy.

I have, however, tried to argue elsewhere that there is a probabilistic argument (Majumdar 1983) and a plausible historical-anecdotal argument (Majumdar, Khadria and Mukherji 1987) both of which point to the interconnectedness of the two questions, separate as they are. I will briefly state these two arguments here.

Probability

The first argument has two parts. For Part I, consider the problem of producing a desired number (say, 5) of a particular type of very high quality manpower, say, top level physicists. This problem, I suggested, (Majumdar 1983, p 13) was basically different from that of producing a desired number of a particular type of very high quality industrial output: "To produce five good sports cars, to take an example from manufacturing high-quality products in a normal economic enterprise, it should not be necessary to produce them in a larger group of fifteen other cars for company and encouragement. But to produce five good physicists it may well be necessary to put them in a class of twenty. This is so not only because students have a tendency to try to keep up with and improve upon one another, but also because they can often learn from one another rather than from the appointed teacher and the other planned inputs."

Moreover, as I argued in Majumdar (1983, pp 13-14), "There may be another factor that usually does not attract our attention: Education itself is essentially a groping and probing process. It may act like the filter that Arrow (1973) postulated separates the good from the indifferent, but perhaps it may do so only after long and continuous search. It is only at the end of the day that it will be discovered which five, among twenty of equal promise, blossom into the high-powered physicists that society had intended to produce."

The implication of the foregoing is simply that society often does not have the equity problem as a constraint to start with. It may not have to choose five from amongst twenty equally promising people for admission to a course, since admitting all twenty may well prove to be actually more efficient.

Part II of the probabilistic argument will run along similar lines, but will be particularly applicable to a situation in which

a large and diversified economy has to look for efficient ways of building up *over time* a large and *diversified* body of specialised manpower. The problem here is one of searching for and grooming the right talent for the right job over a vast field of alternative specialisations. A probabilistic approach to the development of human resources over time in this case goes beyond the consideration of producing the best in a given line out of a given set of entrants—which was the limited concern of Part I of the argument. The wider approach, in fact, would lead to the proposition that the larger the number-base of entrants to education in general (i e, wider the level of literacy), the greater is the prospect of ending with the right array of people trained in the right way for jobs in every kind of specialised occupation.

Thus, whether society addresses the specific task of producing five good physicists out of twenty prospective ones, or the more general task of creating conditions that would maximise the prospect of developing over time a desired level of specialised manpower for the economy as a whole, in either case there will be a positive (and not necessarily only normative) economic argument in favour of larger numbers and, therefore, greater equity. In other words, the pursuit of equity at the beginning may well lead to efficiency in the end as an outcome.

A Plausible Link

Another argument connecting the two questions may appeal anecdotally. It relates to a presumption about our historical experience with skill formation. Skill according to this argument is necessary not only in production but also in consumption. What is more, the former often is encouraged to grow by the latter. This is because the process of formation of a given skill does not necessarily end with the skilled person's entry into the employment market. It usually continues well beyond, the acquiring of further skill often depending on how well it is assessed and valued by the eventual consumers. T C Mits today, according to this argument, plays the role that the cognoscenti played in earlier societies (Majumdar et al 1987, pp 30-31). The very attainment and maintenance of high-quality skills in the workforce, it is held, demands skills of almost similar kinds among the consumers. The standards attained by the artisan working in the medieval guild depended not only on his training within the guild, but also on the fact that among the gentry were amateur practitioners of the same skills themselves who knew exactly what to demand of the skilled craftsmen and how to value superior output. Now this role is taken over by T C Mits. There is now a natural link between the skill of the average person in the street in surviving and prospering in a high-technology society and the skill of the average person as a factor of production in that society.

One implication of the foregoing argument is as follows: those who acquire the type of literacy that modern society demands of T C Mits have a positive role to play in societal skill formation even as consumers. Obviously, the days of amateur gentlemen practitioners of the arts, crafts and games on the demand side contributing towards the excellence of professional practitioners on the supply side are long since passed. What we have in their place on the demand side are the T C Mits variously skilled and informed.

Whether it is the motivation of competition and talent search amongst the learners (suggested by the probabilistic argument) or the prodding of the cognoscenti (suggested by the anecdotal historical experience), the net effect of an appropriate type of literacy provided on a large scale should be positive on productive efficiency itself. With this I now turn to our obvious next concern: What is the kind of literacy that one may call appropriate for T C Mits in the modern high-technology society?

Everyman

The character of T C Mits' predicament in modern times can perhaps best be visualised in the following way. Until very recently—in what one might call the *pre-modern* times—innovations in industrial societies came to the consumer mainly in the shape of labour-saving devices. The introduction of the washing machine or the steam iron meant that Mrs Mits did not any longer have to use her arm muscles vigorously while doing her laundry—just as the introduction of the motor bike had spared Mr Mits from exercising his leg muscles. And what was labour-saving was also time-saving in a straightforward sense.

Modern gadgetry of the present epoch, in contrast, is directly information-using rather than directly labour- or time-saving. That it is usually also labour-saving or time-saving, I submit, is an incidental feature important mainly from the standpoint of the economy or as an accounting description. But it may or may not be an object of particular concern for the individual user.

Let me take a simple example to make this contrast clearer. Consider the automatic and electronically programmed washing machine that has since replaced Mrs Mits' old one. The new machine can be pre-set to perform a series of operations automatically, correctly picking up complicated sequences for washing silk, cotton and man-made fibres. In choosing the right sequence the machine is not constrained by the extent of Mrs Mits' knowledge or ignorance about the treatment of different kinds of fabric for washing.

What Mrs Mits has now embedded in her washing machine is *information*. What she can do without now is having that information drummed into *her* head as part of her human capital. The new washing machine also happens to be labour- and time-saving compared to washing by hand, but it may not be either if compared to the old washing machine in any absolute sense. In fact, oft[en] the minimum quantum of labour or time [to] be spent on the new gadgetry may be great[er] than what Mrs Mits customarily used [to] spend on the old machine. It is only wh[en] the variety, the quality and the quantity [of] output corresponding to that minimu[m] quantum of time and labour are taken int[o] consideration that it might turn out that th[e] information-using machines are relativel[y] labour- and time-saving too compared to th[e] old machines.

There is a genuine sense, however, i[n] which the average consumer may be said t[o] be better off with the information-usin[g] machines. It is in the sense that the new high technology devices offer the consumer ne[w] alternatives that he or she might not eve[n] have thought existed. In other words, the in[formation] embodied in the new machine—t[o] the extent that such information was no[t] already in the consumer's head—may ope[n] up new vistas of extended choice. Extendin[g] the boundaries of consumer choice woul[d] be, by itself, extending welfare in Lancaster'[s] (1966) sense.

One essential aspect of high-technology, then, is that it spares T C Mits the cost o[f] acquiring some information to be stored i[n] one's head—by providing the same information in the machines. But in doing precisely this, it also has to demand that the literacy prerequisite for living in the age of informatics be revised so that T C Mits might read the machines.

What exactly is the character of this new literacy that T C Mits must have today? The answer to this question, I suggest, depends on the level at which T C Mits is expected (or permitted) to operate as a concerned member of society in a high-technology environment, without having to go for (or being dependent on getting the opportunity of) subsequent schooling. In a democracy, one may add, it depends on the level at which T C Mits himself or herself decides to operate.

Literacy Types

T C Mits may wish only to *use* the new machines. This requires, as is nowadays being increasingly discovered, a fairly simple skill. The basic ability to use computers is acquired almost by only having computers around. Old type literacy usually associated with only the first two R's of reading and writing was, in comparison, a fairly complex skill. It involved not only recognising but also recreating the topologically complex forms that constitute the alphabet in any language.

Experience suggests that computer literacy at the level of using the programmed machines only, can be universalised at little cost at the margin since it is probably a function of only the number of encounters one has with computers. Let L_1 stand for literacy at this level. L_1, then, is the first order literacy of our high-technology society.

T C Mits, with any sense, would possibly go further. Eventually one would see the

point of having a personal computer as well to help solve the family's new and increasingly more complicated time-and-money allocation problems with a bewildering set of activity alternatives. The sight of neighbours getting ahead in life with such equipment would no doubt both provide the incentive and show the way. We may call the ability to programme one's activities with the help of high technology as computer literacy of the second order or L_2.

L_2 should be seen as an extension of the more familiar concept of numeracy, the third R ('rithmetic) of old. Numeracy has been the usually forgotten component of overall literacy. It does not, for example, appear among the census figures for literacy. But there is a legend that it provides a divide of sorts between the two cultures—scientific and literary—in the sense of C P Snow (1959).

How widespread can L_2 become in society? One can think of two obvious limiting conditions to the process of universalisation of this computer literacy of the second order. First is the limit imposed by the scarcity of economic resources to T C Mits' access to personal computers. Not everybody, certainly not the majority of the people living in the developing world, for example, could have access to personal computers in the foreseeable future.

It is interesting to note that on the count of access, L_2 is likely to play the almost reverse role of numeracy in a divided society. Of the three R's reading and writing had traditionally marked the privileged class more than arithmetic. The so-called ' illiterates' could, and did, without feeling particularly handicapped, engage in minor trades and other economic activities that depended on the ability to count. Up to a point the ability to count thus tended to play a relatively counter-elitist role in society being a more universal, if not more plebeian virtue, reading and writing being more priestly. L_2, in contrast, even though a descendant of old-time numeracy, differs sharply from its progenitor in this respect. Clearly it will not serve as the poor man's answer to prayer for seeking entry into the twenty-first century.

The second limit to the process of universalisation of L_2 is suggested by an altogether different kind of consideration: Are there possibly certain inherent (mental?) barriers to the kind of scientific literacy that L_2 implies—barriers that every person in the street cannot be expected to be able to overcome? As of now, there are probably no definitive answers to this question. But two kinds of evidence suggest two possible reasons for what Simon (1984) calls a Science-Mathematics Bump.

First, there is the physiological evidence that leads to the popular hypothesis that there are two distinct kinds of intelligence: analytic, located in the left hemisphere of the brain, and intuitive, located in the right hemisphere. The hypothesis is usually embellished further by the notion that scientists and technical thinkers largely depend on analytic intelligence and, therefore, on the left hemisphere of their brains (of course, if they are right-handed). In contrast the imaginative and creative artists are supposed largely to depend on intuition and, therefore, on the right hemisphere.

If L_2 can be acquired through (and only through) analytic intelligence then persons habitually prone to using the right hemispheres of their brains would have a problem—a science-mathematics bump to overcome.

The second kind of evidence is mainly anecdotal, coming from the study of the two kinds of aptitudes—mathematics and science aptitude and verbal aptitude. Simon noted the curious fact that for persons with adequate verbal aptitude the moment of truth for judging their mathematics and science aptitude comes at a curious point—when the occasion arises for making a translation between verbal and mathematical representations of information. "The moment of truth", suggests Simon (1984, p 137), "—the moment that separates those who will continue in science and mathematics from those who will leave the arena as soon as they are permitted to—arrives when the students are confronted with their first algebra story problems, problems stated in natural language that has to be translated into the language of equations. One might naively suppose that this would be precisely the part of the algebra course in which students of high verbal ability would shine. If the anecdotes are reliable, it is not."

Results of research in cognitive psychology, Simon goes on to suggest, indicate that the difficulty encountered in the algebra story problems is not peculiar to the handling of mathematical symbolism as such. It is ingrained in the problem of translating from one language to another because all such translation has to pass through some kind of internal semantic representation in the translator's mind. To be able to create such semantic representation from stories of real life experience is to be able to take the first necessary step in using a syntactical-cum-lexical language to a purpose. Once this internal representation is achieved the problem of translation into mathematics is esssentially not different from the problem of translating a French text into English.

Economics of L_2 must obviously take into account then two adverse possibilities: (1) Many people who are not analytically bent may find themselves at a relative disadvantage with L_2. If they have to depend on the left hemisphere of the brain for acquiring L_2 when they are more accustomed to using the right they obviously will have some problems. (2) Even people with high analytical powers as shown by their high verbal ability may face a mental block in translating from verbal to L_2 language.

There is, fortunately, no evidence to suggest that the ability to acquire L_2 for T C Mits has to be strictly either zero or one. Perhaps like many other attributes, the ability to use computer literacy for solving personal allocation problems too would be normally distributed among the persons in the street. Investment in the spread of L_2 then must make serious and imaginative attempts to undo the inequality imposed by the two adverse possibilities referred to above. Otherwise the consequences could be serious not only for T C Mits but also for the segmented high-technology society itself.

Could the person in the street legitimately have any further expectation in this respect from high-technology? Would T C Mits be justified in looking beyond even L_2? This might appear at first to be a largely hypothetical question seeing that L_2 itself will not be easily universalised, all other conditions remaining the same. But it may turn out to be really not so hypothetical after all if the promise of high technology is to be given credence. It may be useful to define a third order literacy concept L_3 as the ability to acquire scientific education (even L_2) *aided* by computers. This ability conceivably might be universalised more economically than L_2 directly.

For some years now computers have been used to teach computer *procedure*, or what computers are all about, through activity associated with the programming language LOGO. This is in contrast to the standard teaching of programming in languages like BASIC or FORTRAN. Can such approach be extended beyond teaching the logic of computers to the teaching of L_2-type literacy to people who will not necessarily have direct access to personal computers? The apparent success of LOGO-like approaches with programmes that try to diagnose the student's conceptual mistakes and can interact with the student to correct such mistakes makes one hope that what has been possible in specific instances with subjects ranging from arithmetic and electronics to writing may also be possible eventually more generally and with also the types of literacy that T C Mits might need in the modern age.

To what extent computer-aided instruction or CAI could mitigate the two obstacles faced by T C Mits in acquiring L_2—the right hemisphere-left hemisphere divide and the science-mathematics block—can only be a matter of conjecture. But the belief that the right-left polarity in individuals is at most incomplete, and that the science-mathematics bump is a mainly cultural inhibition that can be removed, may not be mere liberal mythology. By what efforts T C Mits can perhaps be weaned away from a habitual predisposition of the mind or be helped to overcome an actual mental block by the use of CAI are still unanswered questions. There can be little doubt, however, that the norms of democracy demand that economics of the new literacy follow up inquiries in these directions. The costs and benefits of investments in alternative ways of producing high-technology literacy among the people could be the main basis for such inquiries.

It may be true, as Simon says, that "We have only a slight understanding of the magnitude and origins of individual differences in the ability to assimilate scientific and mathematical skills and knowledge. And we have less understanding of the methods that will be effective in dealing with the illiteracy of those who evidence, or claim, or even boast of, incorrigibility". Nevertheless, from the brief discussion so far, at least the following assertions appear to be tenable even at our present state of ignorance.

FOUR ASSERTIONS

First, investment in literacy is partly the learner's own investment in the individual's private domain, in time and effort and also money. Which level or order of scientific literacy the person in the street would seek—only L_1 or L_2 or L_3 would partly depend on the individual's predilections or preferences given resources including time and ability and money. It would obviously be useful to analyse these preferences not only in terms of the improved earning potentials of learning—the rates of returns as commonly understood—but also in terms of the needs felt by T C Mits who has to live in a high-technology society.

Second, because of the complementarity of investments in education in the two domains, the actual investments the learner will make in the individual domain would depend not only on individual preferences but also on the range of opportunities provided to the learner by the investments in education, made in the public or institutional domain. And, therefore, it would depend also on the information network that operates in society effectively determining the average learner's access to the available opportunities.

Third, coming to the different types of literacy, a direct approach to L_2 that would help T C Mits to acquire the ability to use informatics in making everyday decisions is bound to be very costly. It would be so costly, in fact, as to be beyond the reach of all but the wealthiest societies. If the idea of L_2 is to stimulate learning by doing then access to personal computers is a *sine qua non*. Computer literacy of this kind is, therefore, unlikely to be capable of being universalised in a poor country or in an unequal society.

Fourth, the realisation that L_2 is unlikely to be universalised directly under any realistic cost calculations in the foreseeable future does not nevertheless mean that the call for universalisation of scientific literacy for the new high-technology age is itself necessarily unrealistic. There is an indirect approach too, and herein comes the concept of a third kind of literacy L_3. L_3 is the ability of the individual to learn science aided by computers that do the job of teachers. The emphasis here is on old-fashioned learning of concepts—in science, in mathematics, in philosophy, in language—from computers, and not on how to operate and programme computers.

L_3, many would say, is a higher ability than L_2. Yet the investment required in the learner's own domain in terms of money—not in terms of effort—would be less for L_3 than for L_2 if the learner has less need for using personal computers while acquiring L_3 compared to acquiring L_2.

One must bear in mind, however, that here we are talking of the relative investment costs of L_2 and L_3 in the learner's domain. The complementary investments that would be called for in the institutional domain for providing the instruction have, of course, to be added in order to get the complete picture.

Yet there is a reason why the comparison of investments in the individual domain for L_2 and L_3 should be separately made. It is simply that these investments would depend on personal incomes and, therefore, on the *distribution* of the national income. Moreover, the individual investments will also depend on individual preferences. In contrast, investments on literacy (L_2 or L_3) in the institutional or public domain would depend on the *aggregate* of the real national income and given this, on society's collective choice decisions on goals of literacy, rather than on the distribution of the national income or directly on individual preferences.

CONCLUSION

I may sum up this brief essay by underlining once again the two concurrent themes that it tries to propound. First, literacy being the entry point of learning to live, can be defined in different ways for different levels of participation in the modern high-technology society. I have suggested that it may be economically more sensible and socially more acceptable to go for L_3, the literacy for learning science (and other things) through computer-aided instruction than to go for the more flashy L_2, the literacy for running personal computers.

The second theme, is one that I have often pursued elsewhere too, as I have mentioned above. It is to stress the importance of domain distinction in analysing investments in education. To analyse investments in literacy the crucial task, from the economist's point of view, is to distinguish between the different types of scientific literacy relevant for our age (and for a given type of literacy, distinguish the different programmes of action) in terms of costs associated with them. These costs (in time, effort and money) have to be seen *separately* as investments in the learner's domain and investments in the public domain.

The two themes together convey a single message: Investment in literacy as an omnibus concept and an undifferentiated target in society is operationally not a very meaningful construct; that without the necessary differentiation there is the great danger of our disregarding either the needs of the times or the needs of the people living in an unequal society. Neither scientif and technological progress, nor the prospe of economic progress based on distributi justice can be disregarded.

That we, in this country, neverthele sometimes prefer to stick to the omnibu concepts and prefer not to distinguish be ween the small print of alternative soci targets may be partly because we a unaware of the dangers to societal surviva that lurk ahead. Our simple-minded en thusiasm for literacy by the twenty-first cen tury is often tragically reminiscent of th equally simple ardour of the crew that ha set sail for adventure in *The Hunting of th Snark* (Lewis Carroll 1876). They were happ with their captain because, disdaining th hard-to- read charts that were "such shape with their islands and capes", he had bough them what he thought was the best map: " perfect and absolute blank"! And then,

> "This was charming no doubt: but the
> shortly found out
> That the Captain they trusted so wel
> Had only one notion for crossing th
> ocean
> And that was to tingle his bell!"

This paper has perhaps tried to sugges only the obvious: that economists have th onerous task of looking for the islands an capes on the uncharted sea of twenty-firs century scientific literacy rather than of eve listening for the captain's tingling of the bell!

Perestroika and Soviet Economic Relations with Developing Countries

India, a Test Case

R G Gidadhubli

Soviet economic relations with developing countries in the era of perestroika will be determined by a host of factors—the troubled economic situation in the USSR and in the east bloc in general, the altered global geo-politics induced by improved relations between east and west Europe and between China and Russia and the economic situation in the developing countries.

This paper examines the changing content of Indo-Soviet economic relations, and argues that these changes provide a clue to the possible course of Soviet economic relations with the developing world.

MIKHAIL GORBACHEV's policy of perestroika is aimed at bringing about a revolutionary politico-economic restructuring not only of the domestic sphere of the USSR but also of its relations outside the country. Several policy decisions which have been announced and steps taken so far with regard to domestic and foreign economic spheres have great significance and seem to suggest the seriousness of the approach to restructuring.

It is important to understand what the impact of the policy of perestroika on Soviet economic relations with the developing countries has been and what the likely impact in the next, say, five to seven years will be. But the issue is not that simple since Soviet relations with the developing countries cannot be considered in isolation, more so in the present context. There are many important factors which have a bearing on this subject. Among them are:

a) The difficult domestic economic situation in the USSR, reflected in budgetary deficit of 45-50 billion roubles, inflationary pressure and shortages of a wide range of commodities;

b) Economic difficulties in the countries of the socialist system (many of which are passing through reforms and restructuring of varying degrees) and their impact on intra-Soviet bloc relations;

c) Improvement in east-west relations resulting from Soviet peace initiatives and their likely repercussions on the world political situation;

d) Improvement in Sino-Soviet Political and economic relations and their impact on Soviet-third world relations.

These factors have relevance to the on-going Soviet politico-economic relations with developing countries of the third world.

The Soviet Union has close political and economic relations with India despite differences in the political and economic systems of the two countries and yet there are many elements in Indo-Soviet relations which are common to different groups of countries—bilateralism, non-convertible currency trade, large-scale economic assistance, substantial imports of non-traditional and hi-tech proudcts from India and so on. Hence India offers a test case for Gorbachev in restructuring economic relations with developing countries.

An effort has been made in the first section of this paper, to review major policy decisions concerning Soviet foreign economic relations as also new forms and trends in economic relations with developing countries. This is followed by an analysis, in the second section, of the recent developments in the Soviet economic relations with India and a few major groups of developing countries. Major conclusions are drawn in the third section.

I

Policy Decisions and New Forms of Economic Co-operation

Several policy decisions have been made, during the last couple of years, by the central committee of the Communist Party of the Soviet Union (CC of CPSU) and the Soviet government, proposing radical changes in the organisation and functioning of foreign trade and economic relations of the USSR. A great impetus was given in this regard by the decision of August 19, 1986, on 'Measures to Improve the Administration of Foreign Economic Relations.' In place of the monopoly of the ministry of foreign trade, initially 21 ministries and 70 production amalgamations and enterprises were permitted to deal directly with foreign countries on the basis of the *khozrachyot* (cost accounting) principle. The state foreign economic committee was created under the council of ministers for co-ordinating and supervising foreign economic activities of ministries, banks, amalgamations and so on. The need for this policy decision was the realisation that the USSR had reached the limits for export of raw materials and that the country was losing its competitiveness in the export of manufactured goods, particularly of engineering products (Shamrai Yu, *Foreign Trade*, 4/1987). Presumably, not being content with the progress of August 1986 policy measure, in June 1987 the CC of the CPSU and the council of the ministers of the USSR adopted a decision on 'The Question of Basic Restructuring of Management and Perfecting the Administration of Foreign Economic Relations'. Through this policy the role of trade and industrial chambers of the USSR and of union republics was increased. There was greater emphasis on new forms of economic co-operation with the chambers being required to diversify their functions to include consultancy, marketing, engineering services, sale of Soviet patents, licences, etc.

During 1988 the tempo of declaration of policy decisions was kept up to invigorate foreign trade sector of the USSR. A law was passed in May 1988, on 'Co-operatives in the USSR', under which production co-operatives were permitted to participate in foreign trade and economic relations, on the basis of their own hard currency earnings. Similarly, the 'Agroprom Service' was set up in May 1988 by the association of organisations under the Agro-Industrial Complex (APK) of the USSR, for promoting economic co-operation with foreign countries in the field of production and processing of agricultural products. In June 1988 the council of ministers approved the regulation (Ustav) on 'Bank of Foreign Economic Activities of USSR'. In 1988 several republics namely Estonia, Lithuania, Kazakhstan, etc set up their own foreign trade and economic organisations following the decision in September 1988 to promote republics to directly enter foreign markets on the khozrachyot principle.

On December 2, 1988 the council of ministers of the USSR took yet another bold decision, on 'Future Development of Foreign Economic Activities of State, Co-operative and other Social Enterprises, Amalgamations and Organisations'. This measure gives the right to every enterprise and production association, which has the potential to compete in foreign markets, and to enter into foreign trade and economic activity on a self-financing basis. They are permitted to form consortia with Soviet and foreign partners to carry out trade and other economic activities.

From the above account it is evident that the Soviet leaders have adopted the policy of greater liberalisation with the objective of giving a boost to the growth of foreign trade of the country.

The pronouncement of the series of policy decisions during the last two to three years

s largely due to a piecemeal approach to : process of decentralisation of foreign de activities. Moreover, the overall em-asis has been on export promotion as a p towards greater participation in the rld trade. Considering the fact that cialist countries and developed capitalist untries account for about 80-90 per cent total Soviet trade turnover, much of the viet effort at restructuring would first and remost be directed towards these groups countries.

The impact of new policy measures on viet foreign trade activities has so far been arginal, partly due to the time required for w organisational and institutional changes become really effective. But in the next o to three years some positive improve-ent in the direction of decentralisation of reign trade may be expected provided there substantial qualitative growth in the Soviet omestic economy and if the constraints of ireaucracy and departmentalism are ercome.

Despite the frequently declared Soviet tention of promoting trade with develop-g countries on a priority basis, the share f developing countries in total Soviet trade irnover is not significant and has declined om 12.7 per cent in 1980 to 12.16 per cent 1985 and further down to 11.25 per cent 1987. In the first half of 1988 the share f developing countries continued to decline 10.6 per cent of total Soviet trade turnover. etween 1985 and 1987 there was reduction trade turnover by 2,722 million roubles ith developing countries. Some Soviet pecialists argue that this was due to the verall decline in Soviet foreign trade, caused artly by the difficulties in the Soviet conomic situation and the economic tuations in many developing countries hemselves. This, however, is not very con-incing. Soviet imports from developing ountries declined by about 38 per cent bet-veen 1985 and 1987 (by 2,077 million oubles—see table) and the level of imports n 1987 was lower than that in 1980. Reduc-on in imports of such a large magnitude vhen the USSR had accumulated and has onsistently been maintaining large surplus n trade account with developing countries s possibly an indication that imports from eveloping countries are not on the priority st of the USSR. Reduction in imports of gricultural consumer products such as tea, offee, detergents, textiles, ready-made arments from developing countries when he USSR was facing heavy shortage of these tems in 1987 and 1988 was not justifiable. Thus perestroika has not so far made any ositive impact on Soviet trade with develop-ng countries.

The Soviet leaders have been particularly mphasising the scope for joint ventures. Hence a significant policy decision, concer-ing Soviet foreign economic relations, was aken by the council of ministers of the USSR on January 13, 1987 on 'The pro-cedure of setting up and operating in Soviet erritory of joint ventures involving Soviet organisations and firms of capitalist and developing countries'. The chief motive for this decision was to promote trade, economic, scientific and technological co-operation with capitalist and developing countries, on a stable and mutually advan-tageous basis. This decree is mainly con-cerned with the setting up of joint ventures in the USSR and hence the scope for developing countries to avail of this oppor-tunity will be limited. Moreover, even for developed capitalist countries the decree was not sufficiently attractive due to limitations in the sharing of initial capital, repatriations of profit, etc. Hence through a decree of September 17, 1987 by the council of ministers on 'Extra measures to Improve Foreign Economic Activity in the New Economic Framework' many of the limita-tions were sought to be removed and provi-sion made for the Soviet involvement in joint ventures to be set up in third world coun-tries. The Soviet organisations are now able to substantially expand co-operation with the firms of capitalist and developing coun-tries in science, technology, trade, finance, services, tourism and advertising. In other words, the Soviet policy makers have given emphasis for Soviet organisations to actively participate in the services sector of develop-ing countries, where their share is negligible so far.

Up to January 1, 1989, 191 joint venture enterprises were registered in the USSR out of which there were only 8 with developing countries which is an indication of the fact that developing countries by virtue of their weak financial and technological position, may have a meagre role to play in the joint venture activities in the USSR. Moreover, the progress with regard to the registered joint enterprises is not very satisfactory.

In some respects even before Gorbachev's policy of perestroika, many unorthodox forms of co-operation in the economic sphere had been promoted in the USSR since the early 1980s. These included technical assistance, processing customers' raw materials, buyback deals, turnkey contracts, production sharing, assistance in operating enterprises, ventures involving three partners and so on. Among these, turnkey contracts have been quite widespread in the 1980s. As per Soviet official sources, by the mid-1980s the USSR had completed 150 turnkey projects in 18 developing countries, including Algeria, Morocco, Mali, Ethiopia, Afghanistan, Libya, Nigeria, Angola, Yemen, Mauritania. In 1985 they constituted 47 per cent of overall Soviet assistance to developing countries as against 4 per cent in 1970. This form of economic relations has gathered further strength under the new con-ditions of perestroika. In early 1986 over 120 turnkey projects were under construction which are to be completed by 1990.

Buyback deals are playing an increasing role in Soviet economic ties. These deals are accomplished in the framework of overall export-import operations, taking into ac-count the production, financial and com-mercial interests of the partners. At present the Soviet Union has over 60 buyback deals with developing countries.

The Soviet Union is making slow but steady progress in establishing foreign economic relations involving third country participation. For instance, a joint enterprise has been set up by Gosagroprom of RSFSR along with the Swedish firm 'Tetrapack' and a Brazilian firm 'Suko-Citriko-Kurtale' for manufacturing apple juice in the USSR and obtaining the concentrate of sweet lemons from Brazil. Similarly, the Soviet firm 'Texprom-export' and the Brazilian firm 'Norberto Olebreht' are jointly building a power station at Kopanda in Angola. [*Foreign Trade,* 1/1988, pp 15-16].

In the engineering sector, the Soviet firm Machinpribor and the Brazilian firm 'Interar' have joint trading activity for the supply of machinery and equipment to Argentina. Similarly, the Soviet Union has set up a firm ADOKS, jointly with Argentina for the sale of Soviet textile machinery and spare parts in that country and in other countries.

In the first half of 1980s the USSR and western firms from about 25 capitalist coun-tries participated in builidng projects in Algeria , Argentina, Vietnam, Iran, Iraq, Pakistan, Greece, Ethiopia and so on. According to UNCTAD secretariat, in the first half of 1980s, 300 projects were built and are being constructed in third countries by joint participation of soicalist and western countries [Foreign Trade, 1/1988]. Most of these projects are in developing countries, although there are some in Greece and Finland. Soviet specialists expect that perestroika will offer new third country market possibilities for the USSR on the basis of compensation.

Since the last decade the USSR has established several joint stock companies in many developing countries for the purpose of handling, shipping and storage of foreign goods—Kateko (1976) in Cameroon, Marim export in Morocco, Sinsov in Singapore, Thasas in Thailand, Filsov in Philippines and so on. This form of economic activity in foreign countries has gained strength since the mid 1980s. The USSR has set up several joint stock companies—Aftorg (1987), Aftento (1987), Aspac (1988) in Afghanistan and Indsotra (1988) in India.

Similarly, Sovrybflot, a company spon-sored by the Soviet ministry of fisheries, has set up several joint fishing companies in the maritime economic zones of develop-ing countries such as Iran, Singapore, Mozambique, Peru and so on. The decrees of January 1987 and September 1987 are likely to boost these types of economic activities in developing countries.

With some Latin American countries the USSR has established a new form of economic relations involving compensation-hiring operations. For instance, Soviet ships are given on hire to Brazil, Mexico, etc, for which the compensation is paid in the form of coffee, cables, etc. [Ishenko I and Khazarov V, *Foreign Trade,* 8/1988]. The USSR has a somewhat similar arrangement with India in the field of civil aviation.

In the recent past there has been a marked shift in the Soviet approach in providing economic assistance to developing countries. In the 1960s and 1970s their declared policy was to assist the development of such branches of industries as were intended to make them self-reliant and self-sufficient in their economic development. Thus the Soviet Union helped many countries in developing power, energy, metallurgy, oil exploration and exploitation and so on, which formed the core sectors of developing countries. Soviet economic assistance is now gradually shifting to the promotion of export oriented areas in the developing countries, such as mining of valuable minerals for exports, processing of agricultural products for exports and so on. A classic example is that of Guinea, where bauxite deposits are mined with Soviet technical and economic assistance so that 50-90 per cent of bauxite is exported to the USSR through an agreement valid for 30 years. Under the present policy of perestroika this shift may get accentuated.

As justification for this shift it is observed that, considering the third world's growing indebtedness and lack of export avenues to repay debts, it would be expedient for the Soviet assistance programme to third world countries to lay greater stress on industries producing exportable goods in order to enable them to repay Soviet loans. Hence this shift serves the economic interest of the Soviet Union.

II

Indo-Soviet Economic Relations

Gorbachev's leadership has brought about intense activity in Indo-Soviet economic relations, partly contributed to by mutual visits by the leadership of the two countries followed by visits of official delegations on both the sides as well as visits by business groups. The top leadership of both the countries have laid the basis for wide scale relationship through the agreement of June 22, 1985 about 'basic directions of economic, trade, scientific- technical co-operation between the USSR and India for the period up to 2000'.

The offer of two huge rouble credits, comprising of one billion roubles, during the visit of Rajiv Gandhi to the USSR in 1985 and of 1.5 billion roubles during the visit of Gorbachev to Indian November 1986, reflected the interest of the USSR in intensifying economic ties with India, which has for over a decade been occupying a premier place in Soviet economic relations with developing countries. The second credit is qualitatively different in the sense that it has a component of rupee resources, made available to supplement the mobilisation of financial resources on the Indian side, for the biggest ever hydro-project at Teri, with a project capacity of 2,400 MKV. The Soviet Union has continued to extend technical and economic assistance in similar traditional areas of energy, mining, metallurgy, etc. Mention may be made of projects at Kahalgaon Thermal power of 840 MKV capacity, at Vindhyachal Thermal Power Station, the metallurgical plant at Visakhapatnam, the expansion of the metallurgical plants at Bokaro and Bhilai, the geological prospecting for hydro carbons in north Cambay and Cauvery basins, the oil processing plant at Karnal with a capacity of 6 million ton per year and transportation to Chaksu-Karnal over a distance of 345 KM, etc.

This offer of two huge credits to India despite domestic resource constraints has partly been necessitated by the Soveit interest in increasing the export of machinery and equipment, in the traditional spheres of India's basic industries, in which the Soviet Union has been well established. The credit offer also enables the Soviet Union to give a boost to sagging exports to India caused by declining oil prices in 1986-87.

Under perestroika, in addition to the above traditional areas of economic co-operation, emphasis is given to new fields and approaches to economic interaction. Among the new trends in Indo-Soviet economic relations is the proposal for joint production in India, in respect of mobile excavators, turbo and hydro generators, drilling equipment, mining equipment, pumps, coking equipment, conveyor belts for the coal industry and so on. For this purpose, the USSR is to initially supply machinery and equipment to India and jointly produced engineering goods are to be partly exported back to the USSR. [Khotsialov, *Foreign Trade*, 3/1988]. So far there is some progress in the joint production of coking equipment in the Durgapur heavy engineering plant in India and heavy duty trucks of 110t capacity. However, bureaucratic delays in negotiations, technicalities on either side and the problem of marketing of manufactured goods and the like have detracted from the success of such undertakings.

As regards joint ventures, although several proposals are being considered by both sides for processing of leather, production of pesticides, herbicides, pigments, etc, what has materialised so far is the setting up of an Indian restaurant in Moscow and the construction of a hotel in Tashkent. A joint unit for transport and shipping in India has been established to facilitate shipping of goods between the two countries. Proposals are being made for the construction of 10 more hotels by 1990 in the USSR at Samarkand, Bukhara, etc. In other words, joint ventures are yet to take roots in Indo-Soviet economic ties.

One area in which the USSR has shown very keen interest to jointly co-operate with India is in the field of science and research in priority areas such as bio-technology, laser technology, immunology, powder metallurgy, computer and electronics, space research, etc. In this regard the visit of academician G I Marchuk to India during the visit of Mikhail Gorbachev in 1986 was significant. A further evidence of this is the creation of a sectoral group for science and technology under Marchuk in the Sovie[t] Indian Sub Committee for promotin[g] bilateral relations between the two countrie[s].

According to Soviet sources during th[e] period 1984-87 joint research has bee[n] undertaken in 22 branches of applied an[d] fundamental science and technology—sola[r] energy, protection of metal against corrosion, powder metallurgy, meteorology hig[h] temperature physics, oceanography and so on. 112 topics were considered in which 66 Soviet and 48 Indian research institutes and laboratories have participated [Foreign Trade, 1/1988]. In agriculture joint research is proposed in the selection of seeds, development of high yielding variety of rice, soil study, breeding of fur animals and so on. However, results of joint research have been obtained in a few fields only such as solar energy and meteorology. Moreover, there are hardly any publications of joint research work either in India or in USSR. Approach to joint research is rather formal and bureaucratic and the outcome of research is insignificant as compared to the expenditure made by both the countries.

Indo-Soviet trade turnover in 1987 was 2,178.5 million roubles which was about 900 million roubles lower than in 1985 and 13 million roubles lower than in 1986. India's share in total Soviet trade has declined from 2.17 per cent in 1985 to 1.69 per cent in 1987 and further down to 1.66 per cent during January-June 1988. It is significant that two-way trade has declined despite intense efforts to boost trade in this period. Overall Indo-Soviet trade turnover exceeded Rs 50 thousand crore in 1988 as a result of intensive efforts in the second half of the year.

This reduction in trade has partly been caused by the decline in the price of oil (from over $ 30 per barrel in 1985 to $ 12-15 per barrel in 1987) which constituted about two thirds the value of Soviet exports to India. The impact of oil price decline was even more devastating for the Soviets in 1986 resulting in a 40 per cent reduction in Soviet exports to India. The oil factor has brought to the surface many issues of Indo-Soviet trade and equally significant are issues raised by perestroika.

The basis of Indo-Soviet trade, namely, bilateralism and rupee trade which served the interests of both the partners, seems to be losing its relevance under changing conditions.

In the opinion of some Soviet specialists bilateralism is a primitive form of foreign trade practice which served its purpose under specific international conditions of 1950s and 1960s. Under present circumstances, bilateralism and rupee trade are not conducive for rational growth of economic relations between the two countries. A similar opinion persists even more strongly among Polish economists concerning Polish Indian bilateral trade relations and it may not be unlikely that with improvement in the domestic economy, Poland may discontinue rupee trade based on bilateralism in the next three to five years. This has some relevance for Soviet Indian trade as well.

However, Soviet policy makers and a aller section of academics consider that pee trade continues to serve the interest both the countries and this opinion is ared by a section of the policy makers in dia as well. The strong justification for dia is that rupee trade ensures availability substantial quantities of oil (four to five llion tons) and oil products (two to three llion tons) and other items such as non-rous minerals, newsprint, fertilisers, etc. milarly for the USSR, rupee trade is a arantee for steady and assured supply of a, coffee, pepper, cashew and a wide range consumer goods. In the last few years me of the hi-tech items such as computers, rox machines, etc, are being imported from dia which, otherwise, were imported with fficulty on hard currency payment. In her words, the Soviets can count on the rge Indian market from where they can im-ort a wide range of traditional and non-aditional goods including engineering ems, either manufactured in India or nported by India from developed capitalist ountries.

Concerning quantitative aspect, as ecided during the visit of Gorbachev to dia in 1986, Indo-Soviet trade is scheduled increase by two and a half times in five seven years, which means that by 1992 vo-way trade is to reach the level of s 1,00,000 crore. According to Soviet pecialists this is not an unrealistic target if ew forms of co-operation including joint entures, production co-operation, etc, play n important role. Moreover, while continu-g to retain the rupee trade arrangement ith India, the Soviet policy makers propose change the structure of exports to India, hich at present is heavily weighted (66-70 er cent) in favour of oil and oil products. n fact, the Indo-Soviet trade structure esembles the north-south pattern with the SSR finding itself in the role of the south. ence continuation of this situation will not erve the interest of the USSR. Hence their fforts are oriented to changing the struc-are in favour of machinery and equipment irected not only at state sector projects but lso at private sector companies. The latter, owever, is not going to be an easy task. The oviet trading organisations have to convince rivate sector firms about the high quality of Soviet machinery, comparable to that of developed capitalist countries, show readiness to supply spare parts, ensure after-sales-service and so on. In many of these aspects Soviet organisations have to go a long way and they lack aggressive sales-manship, being so far confined to dealing with public sector companies in a bureau-cratic fashion. It is to be seen how far under perestroika Soviet firms and organisations change their style of functioning to be com-petitive in the Indian private sector. Hence, in many respects India is a testcase for Soviet exports of engineering products to the private sector in developing countries on a purely commercial basis.

In evaluating the prospects of Indo-Soviet trade it is also necessary to consider the im-proving Sino-Soviet relations as well as Soviet relations with Pakistan. The China factor is particularly important since China can offer many of the commodities that India offers to the Soviet Union since both the countries possess comparable resource potentialities. In turn, for the USSR both India and China offer large markets for engineering goods and prospects for wide ranging economic ties. In fact, Soviet trade with China has increased in the last few years although often erratically.

The Soviet response to the China factor in Indo-Soviet economic relations is not unanimous, true to the spirit of perestroika. In the opinion of Soviet policy makers and a section of academics, an improvement in Sino-Soviet relations will have no adverse effect on Indo-Soviet trade because the latter has grown steadily over the last couple of decades and has been found to be advan-tageous for the USSR and hence will not be given up. It is also opined, rather unconvin-cingly, that the Soviet market for goods such as tea, tobacco, textile goods is large enough to absorb supplies from both China and India. On the other hand, some academics feel that, though not immediately, but possibly after four to five years, the USSR may get an opportunity to choose the source of supply between India and China and that may create an atmosphere of healthy com-petition which will be advantageous for the USSR. It is also argued that improved Sino-Soviet and Sino-Indian political relations may lead to better possibilities of economic interaction for the benefit of all the three countries concerned. While this may be a theoretical possibility, apprehension in Indian circles about a likely adverse effect on Indo-Soviet trade, due to improved Sino-Soviet relations may not be unrealistic. The same reasoning may hold good, though to a lesser degree, about improving Soviet-Pakistan relations so far as India is concerned.

What is the likely impact of the policy of perestroika on Soviet economic relations with 'developing countries of socialist orien-tation' (CSO)?

From various writings in the Soviet press and views expressed by Soviet specialists on developing countries, it is clear that there will be major restructuring in Soviet economic relations with the CSO. This is partly due to a serious reconsideration of the concepts and policies of socialist development during the last four years in the Soviet Union itself. Moreover, in certain cases, the expectations of the Soviet leaders about economic development in 'CSO' were not satisfied leading to a realisation of the mistakes of the Soviet policy towards CSO. In a few cases the Soviet Union had supported military or dictatorial regimes with no real possibility of socialist development due to the absence of political, social and economic basis for a socialist movement. Hence the Soviet policy makers and specialists will be cautious in accepting developments in a third world country as amounting to socialist orienta-tion. So far as the present group of 'CSO' is concerned, ideology is to play a less important role in Soviet policy towards these countries. This was made clear by Gorbachev while addressing intellectuals in Moscow on January 6, 1989. Consequently, economic factors will be playing an impor-tant role in Soviet policy towards 'CSO'.

In 1985 Soviet trade with CSO constituted a small part of their total trade. For instance, with six 'CSO' countries (Angola, Ethiopia, Afghanistan, Kampuchea, etc) Soviet trade turnover was just about 1.2 per cent which declined to 1.15 per cent in 1987. In terms of Soviet trade with developing countries the 'CSO' account for about one-fifth the share or even less. Hence the observation made by Marie Lavigne (1987) that CSO accounted for over half of Soviet exports to develop-ing countries does not seem to be valid. In her calculations the inclusion of countries such as Iraq, Syria, Congo, Seychelles in the CSO group is not convincing.

The Soviet Union has essentially been an exporter of defence items, machinery and other engineering products, while imports from CSO are not large and consist mainly of minerals (e g, bauxite from Guinea), fuels (e g, natural gas from Afghanistan) and so on and a few agricultural products. With the improvement in Soviet-American relations and Gorbachev's policy of 'dialogue' as a means of solving international issues, defence exports by the USSR to CSO will decline which will bring down total trade with CSO. In the immediate future the

TABLE : SOVIET TRADE WITH DEVELOPING COUNTRIES

	USSR			Developing Countries

Soviet Union may not expect any substantial increase in imports from CSO to sustain overall trade level.

Since the coming to power of Gorbachev, newly industrialising countries (NIC) of the third world are receiving greater attention, although so far their share in Soviet trade turnover has been marginal. The Soviet leadership has realised the potentialities of these countries as exporters of a wide range of manufactured goods including hi-tech products which are, otherwise, imported by the USSR mainly from the developed capitalist countries with great difficulty. The Soviet policy- makers and specialists are aware of the fact that rapid economic progress of NIC and particularly of modern branches of industries has largely been the contribution of developed capitalist countries and their multi-national corporations (MNC) and that the USSR may stand to gain by developing trade and economic relations with these countries. In the opinion of some Soviet specialists NICs are not completely free from the control of MNCs due to which trade and economic relations with the USSR are not at the optimum level. Improving east-west relations may facilitate economic relations between the USSR and NICs.

Gorbachev's displayed interest towards the Pacific and east Asian countries through a series of high level visits, the latest being that of Shevardnadze in the end of December 1988, may boost economic ties between the USSR and South Korea, Philippines, Singapore, and so on. Besides increased trade with these countries, there are possibilities of their participation in the economic development of the Soviet Far East through joint ventures, production co-operation, etc. Similarly, as already pointed out, Soviet trade and economic ties with Brazil and Argentina are gradually taking a qualitatively new turn.

The Soviet Union has also realised the potentialities of these countries in scientific and industrial research. Hence the USSR has established long-term co-operation with enterprises and scientific institutes in Brazil which is the first of its type with a Latin American country creating wide possibilities of benefits for both the partners [*Foreign Trade 1/1988*].

III

Conclusion

Under the leadership of Gorbachev, the Soviet foreign economic policy has undergone a major restructuring from the past support to new international economic order (NIEO) and the call for international economic security at XXVII congress of CPSU to the new economic thinking enunciated by him in the UN general assembly in December 1988. His latest policy initiative is based on co-operation and co-ordination of efforts with developed capitalist countries in solving the economic problems of third world countries and particularly of the least developed among them. Gorbachev is in favour of going beyond the economic groupings of north, south, east, west and has extended his country's readiness to reschedule and partly write off debts of some developing countries. Gorbachev's new economic thinking is a reflection of his policy of perestroika of Soviet foreign economic relations.

A series of policy decisions have been made though often in a piecemeal fashion in the last two to three years to enable the USSR to effectively participate in the world economy. Qualitatively new conditions are being created to facilitate the realisation of this objective. However, the progress made so far is inadequate since some of the policy measures are on paper waiting for practical realisation. Formalism, bureaucratic approach to problems of the country and vested interests of different sections continue to offer bottlenecks and resistance to the early and easy implementation of the policy of perestroika.

So far as developing countries are concerned, the Soviet trade and economic relations are likely to undergo major changes. Despite domestic financial difficulties, the Soviet Union will be required to provide economic assistance in order to sustain trade with developing countries. New forms of economic co-operation particularly joint venture and production co-operations have not so far made any impact on the nature of economic relations with developing countries. Considering constraints on the part of developing countries, economically and technologically, new forms of economic co-operation may have limited significance in the near future. The Soviet policy of economic assistance has shifted its emphasis in favour of development of export oriented activities in developing countries, as against the previous policy of assisting them in sectors which were to lead to self reliance, self sufficiency, etc. The new shift in emphasis suits the economic interests of the Soviet Union in order to recover long-term loans extended to developing countries from time to time.

As regards Indo-Soviet economic relations, despite active exchange of visits at political and business levels and the offer of two huge credits two way trade declined between 1985 and 1987 primarily due to the sharp fall in oil prices. The Soviet policy makers are keen to change the structure of Soviet exports to India in favour of machinery and equipment meant not only for the public sector but also for the private sector. The latter, however, is a difficult task requiring major improvement in the quality of Soviet engineering goods supported by aggressive salesmanship and an effective marketing strategy. Improvement in Sino-Soviet and Soviet-Pakistan relations may affect Indo-Soviet trade in the near future.

Soviet policy towards countries with socialist orientation will be based more on economic consideration and interests rath than on ideology. Soviet exports of defenc equipment to countries with socialist orier tation will decline with the improvement i Soviet-American relations. However, th USSR will not give up its political objective in its relations with developing countrie: Newly industrialising countries will b receiving greater attention of the Sovie policy makers under perestroika.

[Paper presented in the 30th Convention o International Studies Association and Britisl International Studies Association held in th University of London, UK from March 28 t April 1, 1989.]

Women, Emancipation and Equality

Asha Jayant
Indira Rothermund

MEERA KOSAMBI writing primarily on Pandita Ramabai's contribution to the women's cause (*EPW*, October 29, 1988) deals with the trends in the traditional position of women in Hindu culture under the subtitle 'patriarchy and the family'. She attempts to sketch 'the patriarchal social system' in the context of the Indian society. In doing this, she contends that the elements of patriarchy are derived from "the ancient texts and hallowed by tradition and custom", and she uses the stereotype argument of feminists that "Brahmanical texts emphasised the supremacy of men". In doing this, she bases her entire statement on Dube's edition of '*Visibility and Power*' (Delhi, 1986), without going into the original 'Brahmanical texts'. On the basis of this book she comes to the conclusion that "women were not only passive but inferior and needed to be strictly disciplined in order to curb their inherently evil and weak character".

In this discussion we cover only the major issue of the lack of appreciation of the limitation of her study, with reference to the ancient so-called Brahmanical texts to support her categorical statements such as "marriage was central to women's life as the only sacrament (sanskara) that she was entitled to" or that "the general view of women as chattel and sex object (with uncontrolled sexuality of their own) led to their seclusion to the home and exclusion from public life". The author further stresses that the patriarchal ideology still dominates Indian society today. The fallacy in this argument is largely due to the fallacy in the framework itself.

Patriarchy, according to Webster's New World Dictionary, is 'male domination' and that is generally the interpretation which both the feminists and their opponents have been taking. The question then is (a) who is a male? (b) what is the nature of domination?

The underlying assumption is that before we whole-heartedly revive the tradition with its values and details or reject it totally, it is necessary to look at the Indian tradition with an open mind and see whether it can offer us an alternative perspective on male-female relationships for the modern situation.

An adequate assessment of Indian women's social status necessarily involves tracing the cultural background of Indian women through the ages especially, the ancient Indian society, as reflected in the earliest literature. As Radha Kamal Mukerji says, "there is a widespread misconception regarding the true status of women in ancient Indian society". He further asserts that, "there is a widespread ignorance about the original Sanskrit literature, both the Vedic and classical and of the Dharmashastras (law books) in which are to be found the laws, customs and traditions which define the true status of women in early times" [Tara Ali Baig (ed), *Women of India:* 1958]. It is pointed out that in the Vedic period highest place was accorded to women in India, the Rig Veda hymns 'praised the virtues of women even as greater than those of men'; in the Samkhya philosophy (earlier than the period of the Buddha) "the primordial one is conceived of as a harmony of Purusha (male) and Prakriti (female)." Similarly, historians highlight how the advent of Buddhism stimulated the idea of women having freedom to be educated, to travel as missionaries and to become Buddhist nuns [Talim, *Women in Early Buddhist Literature:* 1972]. However, later Buddhist priests also spoke of 'women as an evil to be avoided by men', while the Buddhist Jatakas attribute such a 'vile nature to women'.

The Hindu Dharmashastras (200 BC to 200 AD), especially the Manusmriti, took up a rather ambiguous position and the interpreters of Manu's codes contributed to the gradual degradation in women's status. The situation is said to have become worse with the Muslim invasion in the eleventh century. India has experienced varied cultures, and this has left a mark on the cultural habit and practices of the people of India. Therefore, it is most essential to study the status of women in the earlier periods of Indian history if we want to speak of the status of women as based on the Indian traditional culture as it is often done in women's studies.

The concept of external male domination as we have seen is not explicitly mentioned in the earlier Indian tradition. It comes in as an interpretation of the Dharmashastra precepts and the practical system.

In the west the word domination stands for authority, autonomy and power as consistently maintained in western thought and life. In India when self-control is the maxim, domination in Indian thought becomes internal, or inward control over passions and desires. The control is meant to achieve inner strength, inward authority and internal autonomy that may eventually generate a tremendous power over the external world. This principle of self-control is to regulate the social order by limitations for the legitimacy given to all desires. Emphasis is on achieving harmony, order and balance in the social structure instead of rights [Kane, Dharmashastras: 1930-1941].

Further, in Indian thought religion is a way of life and therefore, *dharma* is secular in nature. The whole edifice of the social structure is based on *dharma* and all that the word stands for. It rules over *artha* (economic determinant), and *kama* (desire) in social living. In contrast, the pivot of western thought is economics (*artha*) which rules over desire and morality, religion being a private affair.

Therefore, in western thinking, man, being externally oriented, controls the economic security of woman and she can establish her right, equality and dignity only by the fundamental principles extended to her by the secular law. What is inherent in the Indian tradition appears apparent in western culture. In Indian law, protection and security were her inherent rights assuring her dignity as *dampati* or one unit in society, and law gave credibility to the Upanishadic principles of inherent oneness in the apparent duality [Sachdeva, *Hindu Undivided Family:* 1987]. On the other hand, in the west the principle of duality operates at all levels and therefore rights become essential.

Meera Kosambi's article also suffers from certain conjectures about the Hindu joint family system without adequate textual support; this makes the conclusion that "the normative pattern of role relationships within the patriarchal joint family, as far as the women is concerned, is influenced by the twin factors of authority and emotions," highly suspect.

The unique system which supported

family life in Hindu society was the Mitakshara or the laws of the undivided Hindu joint family. It indicated unity of ownership, and joint possession (Manusmriti, edited by Shastri: 1983). The *karta* or the manager has only limited ownership over ancestral property. The male, because of his external role, developed the image of being the provider of the family initially through custom and usage, and later under codified law. This law seemed to grant him the privilege of ownership rights, and religious ceremonies, acquiring the image of agnatic domination, primogeniture and agnatic succession and the role of protector was carried to the extreme (Sachdeva, *Hindu Undivided Family*: 1987). This led to the decadence of the original view of the Hindu joint family, which was based on the values of mutuality, co-operation and interdependence. Therefore, the justification of the new value of equality and liberty which forms the cornerstone of the feminist movement.

Generally, there is a notional belief, among the feminist social scientists, that the elements of patriarchy in Indian society are derived from the ancient sacred texts and are 'hallowed by tradition and custom'. In view of this belief, it is often emphasised that the supremacy of man, the importance of a male child as a goal in life, assigning to women a 'passive role', etc, are rooted in the Brahmanical texts. It is further asserted that the patriarchal ideology still dominates Indian society today and women's life is therefore considered to be confined to the family. These ideas need to be examined and evaluated by means of a study of the traditional texts referred to by the feminist scholars.

Contrary to this, the 'Brahmanical' Dharmashastras (law books) consider male-female relationship as representing complementarity, and the social order has been formed on this principle of complementarity whose representation is through *dharma*. Purusha, the active male, remains the same principle in *dharmic* law as the *karta* of the family. *Karta* means a manager of the family. His role is to offer protection, security, balance and harmony among the members of the joint family. What is non-aggressive appears domineering in the interpretation of the word patriarchy in the western sense, but that sense of domineering activity is absent in the male orientation of an Indian.

Our comments are not intended to create an impression that the Hindu joint family system is satisfactory in all respects. There is a lot of scope for an in-depth study of the problem of women's position, patriarchy and the family in Indian society.

Notes forming part of the Accounts for the Period from 1st January, 1988 to 31st March, 1989

1) Particulars of remuneration to Chief Executive Officers in India:

	Former Manager Rs. P	Present Manager Rs. P.	Total Rs. P.	1.1.87—31.12.87 Rs.
Salaries and Dearness Allowance	282,339.72	21,066.00	303,405.72	251,248
Other Allowances	89,256.24	112.00	89,368.24	1,560
Bonus	55,219.75	—	55,219.75	8,325
Money value of other benefits and perquisites (including furnished accommodation, utilities and car calculated according to the income tax rules)	231,488.67	2,556.05	234,044.72	174,060
Total Rs.	658,304.38	23,734.05	682,038.43	435,193

2) Fixed Assets had been reinstated in the books of the Indian Branches of the Bank as at 1st January, 1969 by adopting cost in respect of premises and income tax written down value in respect of vehicles, furniture and fixtures.

3) Premises include shares in Housing Companies of Rs. 5,064,337 (previous year Rs. 5,064,337) on which no depreciation has been provided.

4) In respect of tax matters in dispute amounting to Rs. 45,406,893 upto the accounting year 1985 where the bank/tax authorities have preferred appeals, no provision has been made in respect of these matters pending the final outcome of these appeals. However the amount of unremitted profits and Head Office charges withheld in India is more than adequate to cover the liability, if any that may arise in this regard.

5) Figures for the current year are for 15 months from 1st January, 1988 to 31st March, 1989, whereas those for the previous year are for the calendar year ended 31st December 1987. They are therefore not comparable.

Previous years figures have been regrouped wherever necessary.

Auditors' Report on the Indian Branches of Banque Nationale de Paris under Section 30 of the Banking Regulation Act, 1949.

We have audited the attached Balance Sheet of the Indian Branches of Banque Nationale de Paris as at March 31, 1989 signed by us under reference to this report, and the relative Profit and Loss Account of the Indian Branches of the Bank for the period 1 January, 1988 to 31 March, 1989.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account, together with the notes thereon, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with the Forms A and B of the Third Schedule to the Banking Regulation Act, 1949.

We report that subject to and read with the foregoing remarks:

(1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of the audit and have found them to be satisfactory;

(2) The transactions which have come to our notice have been, in our opinion, within the power of the Indian Branches of Banque Nationale de Paris;

(3) In our opinion, proper books of account as required by law, have been kept by the Bank so far as appears from our examination of those books;

(4) The above mentioned Balance Sheet and the Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account;

(5) In our opinion, and to the best of our information and according to the explanations given to us, the accounts together with the notes thereon and subject to note 2 dealing with fixed assets and note 4 with certain taxation matters under appeal give the information required by the Companies Act, 1956 in the manner so required for Banking Companies and on such basis give a true and fair view in the case of the Balance Sheet, of the state of affairs of the Indian Branches of the Bank as at 31 March, 1989 and in the case of the Profit and Loss Account, of the profit of the Indian Branches for the period 1 January, 1988 to 31 March, 1989.

NOTES FORMING PART OF THE ACCOUNTS FOR THE PERIOD ENDED 31ST MARCH, 1989

e Balance Sheet and Profit and Loss Account have been prepared in confor- ty with Forms 'A' and 'B' respectively of the Third Schedule to the Banking gulation Act, 1949.

rticulars of Remuneration paid/provided to the Chief Executive Officer.

evious Year				Current Year
rstwhile Officer Rs.	Present Officer Rs.	Total Rs.		Rs.
,58,400	30,000	1,88,400	Salary & Bonus	1,89,930
24,376	5,122	29,498	Perquisites evaluated in accordance with Income Tax Rules	33,712
,82,776	35,122	2,17,898	TOTAL	2,23,642

ovision for Income-Tax has been made on the basis of the stand taken by the nk in the return of income and appeal filed by it with the assessing authorities.

Pending outcome of the appeal/assessments, the additional tax liability, if any, cannot be ascertained.

4. In cases where the Bank has made no provision for bad and doubtful advances the balance as on 31 March, 1989 in the Unremitted Profits Account is considered adequate to cover the after tax impact of subsequent losses, if any, arising out of these advances. In view of the steps being taken for the recovery of these advances, it would be premature to quantify such losses.
5. For making provision for doubtful advances, the Bank has taken into account certain claims from the guarantee institutions which the Bank has considered valid and recoverable.
6. The Bank is of the opinion that the decision of the Honourable Supreme Court regarding the taxability of interest on sticky advances in the case of State Bank of Travancore Vs CIT is not applicable in cases where no interest has been charged on sticky accounts. The Bank has therefore not made any provision for income-tax in respect of cases where no interest has been charged on sticky accounts.
7. Depreciation has been provided at the written-down-value method rates prescribed in Schedule XIV of the Companies Act for the 15 month period ending 31.3.1989.
8. Previous year's figures have been regrouped wherever necessary and are not comparable with the current period figures which are for a period of fifteen months.

REPORT OF THE AUDITORS

We have audited the attached Balance Sheet of the Bombay Branch of Bank of Oman Limited as at 31st March, 1989 and also the Profit and Loss Account of the Bombay Branch of the Bank for the period ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with provisions of Sub-Section (1), (2) and (5) of Section 211 and Sub-Section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account, together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The Accounts are, therefore, drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that read with the foregoing remark:

(a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

(b) the transactions which have come to our notice have been, in our opinion, within the power of the Bombay Branch of the Bank;

(c) in our opinion, proper books of account as required by law have been k by the Branch so far as appears from our examination of those books;

(d) the Balance Sheet and Profit and Loss Account of the Bombay Branch of Bank dealt with by this report are in agreement with the books of accou

(e) in our opinion, and to the best of our information and according to explanations given to us, the said accounts read with the notes thereon a subject to
  (i) Note 4 regarding provision not having been made for certain bad a doubtful advances and
  (ii) Note 6 regarding provision for tax not made on interest not charged sticky advances,

give the information required by the Companies Act, 1956, in the manner required for Banking Companies and on such basis the said Balance Sheet gi a true and fair view of the state of affairs of the Bombay Branch of the Ba as at 31st March, 1989 and the Profit and Loss Account gives a true and f view of the profit of the Bombay Branch for the period ended on that da

Vol XXIV No 31 August 5, 1989

Budget 1989-90: Reflecting Constraints and Confusions

Policies of the government are the outcome of the pressures from the diverse ruling interest groups. This limits the government's capacity to utilise the economy's resources more rationally which in turn increases social tensions and demands on the government. The 1989-90 budget reflects yet again the government's incapacity to break out of the low growth trap. Technology is unlikely to 'take off' to raise 'efficiency' or reduce costs to make Indian goods export competitive and efforts at creating employment are too inadequate. A more explicit policy of state intervention can reverse these trends. **1771**

Afterthoughts on a Bloodbath

The Beijing tragedy has inflicted serious damage on the CPC's ongoing programme of socialist modernisation through an updating of science and technology which depends for its success on the involvement of the Chinese intelligentsia and the collaboration of advanced capitalist countries. **1785**

The Chinese treatment of the students cannot be justified. Equally, nor can the holier-than-thou attitude of the Big-7. **1748**

Granted that the Chinese students are fighting for some kind of freedom within Deng's political system, is that the same thing as fighting for 'socialist freedom'? Freedom in the socialist sense is much more often 'freedom from' than 'freedom of' which is not the same thing as saying that socialism is inimical to civil liberties. The socialist concept of freedom demands that we look at the question of civil liberties in a socialist society in its own terms and not in liberal terms. **1761**

Infant Deaths in Calcutta

The rapidly deteriorating public health system in Calcutta has once again been highlighted by the recent mass deaths of fourteen newborn babies at the Calcutta Medical College and Hospital. And yet again the state's health administration is more concerned with manufacturing excuses and churning out temporary remedies than with instituting basic changes. **1751**

A 'Third Alternative'?

In the last couple of years the track record of the left in Pakistan has been so poor that it is indeed a miracle that there is a left at all in the country. Recently though the newly formed Qaumi Inquilabi Party has been making an effort to unite what remains of the left to forge a 'third alternative'. **1759**

Sri Lankan Fiasco

The Indian prime minister now feels betrayed. The Sri Lankan ruling class did not avail of the opportunity provided by the IPKF. Junius Jayewardene is gone; they have installed in his place a commoner who lacks breeding and manners and does not quite belong **1743**

Legislators' Privileges

In early May Yashwant Sinha of the Janata Dal raised in the Rajya Sabha a breach of privilege question against the Chandigarh administration on his arrest and detention in the city recently. That the matter is still only being 'looked into' is cause for serious reflection. **1745**

In Maharashtra a journalist's report of the corruption in the secretariat has been held to be a breach of privilege which lowers the prestige of the legislature. **1749**

Arm Twisting Press Barons

With every change in the political regime in Madhya Pradesh, the correspondents of national dailies are appropriately changed. It is no coincidence that those who are transferred out are the ones who are not on good terms with the new incumbents. **1755**

'No' to a Steel Plant

Now that the furore about the steel plant in Wardha, near Gandhi's Sevagram has somewhat died down, the Ashramites' objections should be closely examined. **1754**

LETTER TO EDITOR

Nature of Indian Capitalism

THIS is in reference to the review of our book *Technology Development and the Environment* by A Chokkalingam (June 3). I am most grateful to Chokkalingam for an important comment he has made on my paper 'Population Growth, Technological Change and Economic Development' which runs thus: "Issues of class and extraction of surplus value in this context are not specifically discussed" (col 2, p 1226).

In my paper under reference, I have tried to show that the capitalist class in India is a result of transplantation of the capitalist mode of production from overseas where this mode of production has evolved historically. As such the capitalist class in India has no root in its history. India had wealthy feudal and mercantile classes but surplus social labour extracted by these classes did not play any role in India's capitalist industrial development even though India was rich in proto-technology—products of which were known world-wide at that time. Causes of the failure of industrialisation to evolve in India from traditional proto-technology were discussed in my paper. Briefly, population pressure on the existing resources and technology was not strong enough to generate forces to develop proto-technology into industrial technology as it did in Britain. The population growth rate was meagre at around 2 per cent or even less and sometimes negative and not sustained. In the view of Kautsky, feudalism, like other modes of production, only has the ability to sustain no more than a certain size of population and once that limit is reached feudalism gives way to another mode of production (capitalism) which can carry on with the task of sustaining the population too big for feudalism. (Quoted in A Hussain and K Tribe, *Marx and Agrarian Question,* 1987 and see for details also P Maitra, *Population, Technology and Development,* Aldershot, UK, and Vermont, USA, 1986).

Capitalism in India not having been a product of India's own social and economic development generating the social surplus needed for capitalist transformation, it has failed to play any progressive role of the type that capitalism played in the UK in the nineteenth century. An introduced capitalism results in acute exploitation, poverty and economic inequality but cannot bring about revolutionary change in the mode of production and with it in social consciousness. That is why, despite a long history of introduced capitalist industrialisation in India, over 70 per cent of labour force is dependent on primary sector and only 9 per cent is in manufacturing including 3-4 per cent in small scale and household industries. When capitalism emerges as a historical necessity, a society cannot afford this kind of undeveloped economic structure. On the other hand, when the mode of capitalist production evolves in a society, it brings about a revolutionary change in the social mind, hitherto a feudalistic one of worshipping of nature and feudal lords, blind religious faith and fatalistic outlook on life. In India, the recent rapid growth of industrialisation and modernisation, on the contrary, has been accompanied by a rising tempo of feudal practices, religious fanaticism, religious fundamentalism, communal riots, etc.

With the above interpretation of class and its role, very little can be said of the significance of surplus extraction resulting in the development of capitalism. There is no doubt about the fact that a huge surplus is extracted and gets increasingly concentrated in the hands of a few due to the nature of technological change introduced in these societies. In 19th century cases of capitalist industrialisation, extraction of surplus played a vital role in the spread of capitalism absorbing human resources in a more productive way. Thus surplus was generated as a result of increased productivity of social labour.

In later cases of capitalist industrialisation, with imported technology from developed economies at their intensive phase of technological change, the rate of extraction of surplus has been enormous and much higher than what it was during the 19th century capitalist industrialisation, but with little diffusion effects and with no impact in terms of raising social consciousness as Marx envisaged. On the contrary, rapid growth of modernisation with imported technology has been accompanied by strengthening of the feudal social mind, deepening communalism and religious fundamentalism, etc. This is to be expected, because when technology and production instruments evolve from traditional stage through interactions between social mind and environment human resources are processed and divested of past feudalistic blind religious faith, fatalism, etc. As the technology based on science evolves through more productive use of labour, the capitalist system extracts social surplus for its own use and, unconsciously, prepares its own grave. In Marx's view, factory life required cooperation among workers against the onslaught of capitalist exploitation. This helps the development of a communist consciousness which is a necessary and irreplaceable step prior to the revolutionary establishment of a communist society.

Is this applicable to the capitalism of India where factory workers comprise only 6 per cent of the labour force? When capitalist technology, evolved in another country through the use of its social labour, is transferred to India or any other third world country of today, it absorbs very little of their labour in capitalist production but undoubtedly it generates a tremendous amount of economic surplus while the vast majority of the workforce remains engaged in primary activities, small scale and household industries, as petty traders, porters, domestic servants, etc. The capitalist service sector again absorbs very little of human capital. The capitalist sector, though very limited, extracts a huge surplus but with very little labour.

In the circumstances, the extraction of surplus has no more significance than surplus extraction by the mercantile capitalist class. That is, introduced capitalism draws a huge surplus but fails to revolutionise the mode of production and develop socialist social consciousness as most Marxists believe.

Because of these reasons, I did not give any importance to the analysis of class and surplus extraction. But I think, I should have included the analysis and its absence has been a grave mistake. I owe an enormous debt to G Chokkalingam and your esteemed journal.

Political Winds

THE rapid political developments of the last three weeks marked by the presentation of the Comptroller and Auditor General's report to parliament, the decisive resurfacing of the Bofors scandal as a political issue and the mass resignation of opposition MPs from the Lok Sabha have put the prime minister personally and the top leadership of the Congress(I) on the defensive; equally importantly, these developments have served to re-emphasise the fact that the coming elections to parliament will be essentially a contest between rival segments of, what may be called, bourgeois political forces in the country. Indicative of this are two immediately evident consequences of the latest political events. First, within the opposition the position of the Janata Dal under the leadership of V P Singh has been definitely enhanced. It is interesting in this context that the Congress(I)'s counter-strategy of trying to implicate V P Singh in the Bofors deal because he had been finance minister in Rajiv Gandhi's government when the deal was struck has had little impact. Second, within the Congress(I) there has emerged open restiveness and rumblings of disaffection towards the party's leadership. Two prominent members of the party—Rao Birendra Singh from Haryana and H N Nanje Gowda from Karnataka, both with not inconsiderable political bases in their respective regions—have already come out in the open, but it is clear from its reaction that the Congress(I) leadership is aware that the sentiments publicly expressed by these two leaders strike sympathetic echoes in fairly wide circles within the party. These two trends are, of course, related and mutually reinforcing. The enhanced position of the Janata Dal within a generally reinvigorated opposition widens the political options available to Congressmen, especially those with relatively sound local support bases who had been ignored or even deliberately side-lined by the prime minister and the coterie around him but who have now once again become politically relevant with the approaching elections. Such Congressmen will increasingly perceive that there can be political life for them beyond and without Rajiv Gandhi and so begin to assert themselves within the party and, should cost-benefit calculation suggest the wisdom of such a course, cross over to the Janata Dal at strategic moments between now and the elections. V P Singh's statement on Thursday calling on Congressmen "with conscience" to revolt against the party leadership is a response to this situation and a signal to malcontents in the Congress that the Janata Dal will have worthwhile openings for them. Of course, the more the number of prominent Congressmen who shift their allegiance to the Janata Dal, the further consolidated will get the position of the Dal within the opposition (and, not unimportantly, that of V P Singh within the Dal itself).

Another widely-noticed development in recent weeks has been the readjustment of the position of the left parties led by the CPI(M), reflecting a coming to terms with the emerging political situation. Not only did the left parties decide to fall in with the strategy of mass resignation of opposition party MPs, but making explicit the implied logic of the move the CPI(M) general secretary, E M S Namboodiripad, finally conceded in an interview this week that the principal enemy was the Congress(I) led by Rajiv Gandhi and so the principal task just now was the removal of the Congress(I) from power at the centre. Of course, the CPI(M), and the other left parties, continue, through repeated public statements, to take care to keep their distance from the BJP and declare that they would not engage in any sort of joint political activity with that party. It is worth noting, however, that within the emerging overall political situation, relations between the CPI(M) and the BJP are much less important to either opposition unity or to the opposition's electoral prospects than the two parties are apt to make out. However genuine and wide the ideological differences between the two parties may be, in the immediate context of the parliamentary elections, these differences are not the dominant issues even for the two parties themselves. This is brought out, in the case of the CPI(M), by the differences among the opposition parties in regard to the stand to be taken on the government's panchayati raj bill in the Rajya Sabha. On this issue the confrontation that the CPI(M) faces is not with the BJP at all but with the Janata Dal itself. The CPI(M), taking its stand on the need to protect the state governments' powers against encroachment by the centre, is for total opposition to the bill so as to deny the government the two-thirds majority in the Rajya Sabha necessary to ensure the enactment of the constitutional amendment. On the other hand, the Janata Dal, essentially sharing the Congress(I)'s motives in seeking to pander to the local power structures in the rural areas, in particular in the Hindi-speaking northern states, does not want to give a political handle to the Congress(I) by appearing to come in the way of the enactment of the panchayati raj bill. Similarly, in the case of BJP, when it comes to sharing out constituencies for the elections, the major differences and conflicts it is going to face will be with the Janata Dal, especially in the northern states. This is not to say, of course, that the issues that divide the left parties from the BJP are not vital ones from the standpoint of the long-run direction of the country's polity, but in the coming elections, which will be fought out essentially among different segments of bourgeois political forces, these issues are hardly going to be decisive.

CONGRESS(I) POLITICS

Fanning Communal Flames

WHENEVER the Congress(I) tries to play the communal card, it either unleashes a fundamentalism which becomes uncontrollable, or reinforces the established fundamentalist groups which can always outwit the Congress(I) at their own game.

Indira Gandhi, in her bid to outsmart and disable the Akali Dal wooed those Sikh fanatics who were to the right of the Akalis and created a Bhindranwale. What was probably meant to be a temporary clog to queer the Akali pitch, has now become a Khalistani automation which no longer obeys New Delhi.

Her son, by trying to toady both the Hindu and Muslim fundamentalists, has opened the floodgates of religious revivalism and allowed the communal parties and groups on both the sides to gain legitimacy. When in February 1986, at the instance of his party people in UP, the disputed Ayodhya shrine was unlocked to allow Hindu devotees to go there and claim it as the birthplace of Rama, it should have been recognised that Hindu fundamentalists of all hues, ranging from the seemingly moderate BJP to the delirious Vishva Hindu Parishad would not stop at mere prayers. Neither the promise of a court verdict (to be given by a newly constituted three-member bench of the Allahabad high court) nor unfavourable astrological predictions (manipulated by a desperate ruling party to avoid communal riots on the eve of elections) can deter the Hindu fundamentalists from going ahead with the programme of starting the construction of Shri Ram Mandir at the controversial site in Ayodhya in November this year. Instead of toying with the soft options of legal verdicts and astrological predictions, the government could adopt the hard choice of clamping down upon the hordes of fanatic devotees who are coming from all corners of India carrying bricks for the proposed temple. But the state would not dare to 'hurt Hindu sentiments'. It would rather deploy the police to prevent or beat up the Leftist demonstrators who under the auspices of the CPI and the CPI(M) are planning to converge at Ayodhya in November to prevent the construction of the temple—a rare bold gesture by the Communists to fight the communal forces. In any confrontation between the fundamentalists and the democratic and secular forces, the Indian state always intervenes in favour of the former. Witness its behaviour during the anti-sati demonstration led by Swami Agnivesh some time ago, when it was prevented by the police from expressing its protest against the Hindu revivalists.

Such kid-glove treatment of Hindu communal forces by a state already identified overtly with Hinduism through officially used Hindu myths and symbols, invariably encourages chauvinism among the Hindus and emboldens the Hindu communal groups. This is markedly noticeable in the heartland—the citadel of obscurantism, religious superstitions and fundamentalism of both the Hindu and Muslim varieties. The recent victory of the BJP in the municipal elections in Lucknow and Allahabad indicates that the party has thrived upon the religious revivalism generated among the Hindus, in the wake of the Ayodhya shrine dispute.

The three-member bench of the Allahabad high court constituted for the speedily disposal of the Ayodhya dispute, will hear the case in Lucknow. The historic city has been chosen for the hearing since, according to an official order, had for centuries been free from communal hatred, bias or prejudices and had remained a "glittering example of the democratic and secular outlook". Things at the moment being what they are, one can only hope that Lucknow does not become another Meerut, and the hearing of the case does not provide yet another handle to the Hindu and Muslim communalists to start a riot there.

BIHAR

Crude Censorship

THE manner in which the ruling elite, at various levels, has set about suppressing criticism is nothing if not systematic. At the national level, the non-official media is sought to be brought in line via shrewd formulations of the newsprint policy and attempts at legislative redefinition of the dimensions of freedom of the press itself. Public outcry against the Defamation Bill has, at least temporarily, stalled the latter. Recourse to such methods may reasonably be interpreted as a tacit admission, by the officialdom, of the ineffectiveness of the government in its chosen project of marketing the virtues of the current leadership. It would seem that the recent hard sell campaign, that bars no hold and presumes on too much in the matter of public credulity, has found little purchase.

That, however, is cold comfort when the cruder methods of censorship employed by the regional and sub-regional power elite are considered. The incidents in Bihar, involving attacks on the press reflect the extent of collusion between the administration and criminal elements. The distinction between the former and the latter is not strictly valid, given the unabashedly criminal activities of the administrative arms, as for instance in Dhanbad, the fiefdom of the notorious coal-mafia. A sordid drama that began with the attempted rape and assault of a 16-year-old tribal girl by seven policemen culminated in the arrest and maltreatment of several journalists.

The arrests and subsequent harassment in custody constitute an obvious attempt at gagging the press, by terrorising individual pressmen. The Dhanbad police arrested Brahmdeo Sharma, the togenarian editor of *Awaaz*, a local Hindi daily that had been critical of the nexus between the police and the mafia. The immediate provocation was the paper's sharp attack on the statement of the superintendent of police justifying the attempted rape on the ground that the victim was 'characterless'. Journalists who went to see Sharma in the lock-up were detained. Saleman Ravi, a reporter of the English daily *New Republic*, who was covering a demonstration in front of the assistant district magistrate's (ADM) office, was assaulted by the police and had to be hospitalised. Ashok Verma, correspondent of the *Nav Bharat Times*, who went to visit him in hospital was subjected to violence by the police in the presence of the deputy development commissioner and his wife, and the ADM, who, ironically enough, discharges responsibility pertaining to law and order. Verma was handcuffed and kept in custody, without any consideration for his kidney ailment, while the chief minister's instruction to release him were ignored by the Dhanbad administration, which even refused to hospitalise him despite his critical condition.

The entire episode mirrors the realities of Bihar politics. The unrestrained attack on the press is only a part of a broader process of degeneration of the polity. Democratic rights are devalued as the administration and a constellation of anti-democratic elements feed off each other in harmonious symbiosis. In a milieu in which the people are browbeaten into submission it is only the uniform that distinguishes the lumpen in the constabulary from the lumpen outside it.

JHARKHAND MOVEMENT

'No Jharkhand, No Elections'

Indu Bharti writes:-

TWO months ago it appeared as if the Jharkhand Movement would once again fall prey to the electoral ambitions of its leaders. What strengthened this feeling was the fact that the All Jharkhand

Students Union (AJSU) which was staunchly opposed to the participation of the Jharkhand Coordination Committee (JCC) in the elections had to bow to the wishes of leaders like N E Horo of the Jharkhand Mukti Morcha (Mahato) and Santosh Rana of the CPI(ML) who were favouring participation in the elections. But, the one-day seminar organised by the JCC on June 22 at Dhanbad to discuss the issue of participation/boycott of polls and to take a final decision on the issue has changed the scene.

At the seminar, the AJSU leaders after realising (as a result of the two rounds of talks they had with the central and state governments) that the government's intention was only to trap them to get their agitational programmes suspended, once again argued for the boycott of the elections and advocated the slogan of 'No Jharkhand, No elections'. Other constituents of JCC like the Jharkhand Party, JMM (Mahato) and CPI-ML (Rana) agreed that unless the Jharkhand state was created, no elections would be allowed to be held in the region. More significant however was the rapprochement between the AJSU and the JCC. They not only ironed out their simmering differences at the seminar and agreed to work unitedly in future but also resolved that henceforth the AJSU would not be treated as only a constituent of the JCC, but, would be projected as the youth wing of the JCC and all the agitational programmes of AJSU would be supported by other constituents of the JCC. The JCC and the AJSU have given an ultimatum to the centre for creating a separate Jharkhand state by August 15 next, failing which they have threatened to resume their non-cooperation movement beginning with a seven-day bandh call from that date.

The Jharkhand Mukti Morcha (Shibu Soren) however, opted to go for a 'referendum' to seek the opinion of the tribals on the issue of participation in elections. The JMM (S) also constituted a committee for this purpose. But soon after in the first week of July, it has entered into a poll-alliance with the Janata Dal. This makes its real intentions clear.

Meanwhile the third round of talks scheduled to be held with the Jharkhand leaders on July 7 has been abruptly postponed and there is considerable uncertainty as to when it will take place. Just how serious the government is about solving the Jharkhand problem is evident from the fact that S K Pachauri, joint secretary in the union home ministry who was sent as the centre's representative during the first round of talks, was transferred to Andhra Pradesh within a week of the Patna talks. In fact, he was, reportedly, already under orders of transfer when he was despatched to Patna as the centre's representative.

JAPAN

Labour Shortage and Immigrant Workers

JAPAN's ministry of labour is reported to have come out with an estimate of the labour shortage in the country. The estimate is based on a ministry survey of some 15,000 private firms across the country covering the light industrial sectors and involving 62 job categories. The major finding of the survey is that as against 18.5 million workers employed by private industries there were as many as 2.1 million vacancies. Thus the overall shortage was of the order of 11.3 per cent. The greatest shortage was found to be in construction where it was to the extent of 26.7 per cent. In terms of job categories, it is estimated that as many as 2,49,000 more sales personnel are needed, 1,75,000 shop assistants, 99,000 bus, truck and taxi drivers and 88,700 accountants. The survey has also revealed that labour shortage is most serious for small and medium sized firms employing less than 300 persons. In fact these firms account for 90 per cent of the overall shortage.

It would appear that the survey excluded from its purview not only agriculture but also the entertainment industry—the two areas which seem to have attracted a large number of mostly clandestine, migrant labour from south-east Asia, particularly Philippines. More than 1,00,000 Philippine workers are estimated to be in Japan sweating it out in either entertainment (which is very much a euphemism for the prostitution industry in Japan and where possibly there are quite a few women from Thailand as well) or agriculture.

Given the growing labour shortage in Japan, the question under debate right now—though the debate is still rather muffled—is whether to allow the immigration of workers in an open but regulated manner or to allow the present clandestine immigration to continue and grow. The latter has all the evils which one generally associates with illegal activity of any sort, though it also allows the labour importing country to exploit to the maximum the weak bargaining position of the migrant labour. (It is not quite certain though that the gains from this exploitation accrue to the industries which actually employ such labour.) The question of immigrant labour can no longer be swept under the carpet, given the magnitude of labour shortage revealed by the labour ministry's survey. And when decisions on the subject are taken, countries like India cannot be unconcerned. The outflow of workers to the Gulf having slowed down with the need for unrequited inflow of foreign exchange greater than ever before, India has perforce to look for possibilities and opportunities elsewhere.

SOVIET UNION

Miners' Strike

AT this year's May Day parade in Moscow one of the floats showed the Soviet worker crushing the pencil-pushing figure of a Soviet bureaucrat under a huge crate labelled perestroika. But little did the Soviet ruling elite expect such action to be unleashed in reality. While it may be an overstatement to characterise the recent coal miners' strike that spread from Kuzbas in Siberia to Donbas in the Ukraine as 'perestroika from below', it could be described as 'coal miners for perestroika'.

One of the main demands of the miners was for individual pits to be given financial autonomy *vis-a-vis* the ministry and the regional coal boards. This would mean that the local managements of the pits would have to be given decision-making powers over incomes, expenditures, contracts other than state purchases and the allocation of surpluses. In other words, the mine workers were articulating the interests of the local pit managements in the hope that the latter would safeguard their interests in matters such as spending the surpluses on improving their social facilities, etc. *Khozraschet* (economic accounting) and self-financing which were extended to almost all enterprises quite

CORRIGENDUM

The Research Officer wanted by Centre for Studies in Decentralised Industries, 5th floor, N K M International House, 178, Backbay Reclamation, Bombay-400 020 should have a Master's Degree in Economics/ Social Science instead of a Degree in Economics/Social Science as erroneously mentioned in its advertisement appearing on page 1686 of this journal dated July 29, 1989. All other particulars remain unchanged.

recently were only applicable to each regional coal board as the unit in the coal industry. The coal miners felt that this was benefiting the bureaucracy where they should have been deriving the benefits. Instead they had to continue to put up with poor living conditions. Bad housing, food shortages and poor social amenities in Siberia have also contributed to the spread of discontent.

Shortages of food and basic consumer goods like meat, condensed milk, tea, coffee, cocoa, sugar, detergent and soap are perhaps a graphic illustration of some of the problems of the Soviet economy. Two other economic problems are the deteriorating financial position of the government, especially the growing budget deficit, and the external account deficit. According to Nikolai Ryzhkov, the Soviet prime minister, the debt-service ratio—proportion of export earnings required to finance interest and amortisation payments—has "passed the red line of 25 per cent". The budget deficit, according to one Soviet economist, is 24 per cent of the total budget. Again, according to Nikolai Ryzhkov, total Soviet foreign borrowing from the west is around 34 billion roubles.

All the same, as a concession to the miners, Mikhail Gorbachev announced that 10 billion roubles had been set aside for the import of consumer goods, which is double the amount announced previously.

The miners' strike has forced the government to concede greater financial autonomy to the coal mines. The government has also agreed to a 50 per cent increase in the pithead price of coal. The demand of the Coal Miners Union was for a 100-200 per cent increase. The burden will fall on the thermal power plants unless they too get a hike in electricity tariffs. The politics of administered pricing is perhaps one of the core issues today for this affects the relative profitability of different sectors. The problem is compounded by the reluctance of the government to bear the burden of loss-making enterprises which require continual capital subsidies.

In a departure from past practice the official Coal Miners Union has backed the demands of the coal miners. The miners have also been supported by the central press. While they may not become 'masters of their pits', the miners are at least getting a taste of the fruits of glasnost.

BUSINESS

SUGAR

Price Rise Stoked by Government

M D Dewani writes:

SUGAR prices are threatening to go out of the government's control. Already they have jumped by about Rs 1,000-1,100 per tonne between June 26 and July 20 and the possibility of a further spurt cannot be ruled out as the steps taken by the government have proved ineffective.

It was on June 26 that the government reduced by 50,000 tonnes to 8.32 lakh tonnes the monthly sugar release for domestic consumption and, possibly being aware of the likely adverse reaction in the market, simultaneously sounded a warning that "with enough sugar stock the government would not hesitate to release substantial quantity in case of requirement or in case prices do not remain reasonable in the open market". Sugar mills and the trade have virtually ignored this warning as hollow for there would have been no need to slash the monthly supply of sugar to the domestic market if the stock with the government were large enough.

The sugar market responded with a smart rise in prices but the government did not release any additional sugar as it had threatened to do. That only confirmed the belief that the government might not be having a big stock or it might not be considering the surge in prices unreasonable. That added fuel to the fire and sugar prices have continued to move forward. It would not be unreasonable to assume that an extra Rs 40-50 crore will pass this month from the pockets of consumers into those of sugar mills and traders.

The steps the government has taken to restrain the flare-up in sugar prices have been of no avail. For instance, on July 11 it prohibited wholesalers from selling sugar to other wholesalers in the same cities or urban areas in certain states, but that announcement fell flat. Thereafter the Reserve Bank tightened margin requirements on bank advances against sugar, khandsari and gur stocks. That too is unlikely to have any impact on the surging prices as the spurt is not due so much to stock holding with bank advances as to the demand-supply imbalance and government failure to rectify that situation.

In fact sugar prices had started looking up right from March last in view of reports that sugar production might fall much short of the earlier over-optimistic estimate of 102 lakh tonnes. Moreover, sugar mills had started pressurising the government to allow exports so that some quantity could thus be siphoned off and the consumer could then be squeezed at will. As if to add fuel to fire, Sukh Ram, union minister of state for food and civil supplies announced in early April 1989 that the government had decided to allow export of one lakh tonnes of sugar immediately and another identical quantity later. The sugar mills took this as the signal to start pushing up prices. As if oblivious of this situation, the minister again announced in parliament that it had been decided to export sugar as production was likely to be more than the 91.10 lakh tonnes achieved in the previous year.

As more alarming reports of cane shortage and likely fall in sugar production continued to flow in, the government cancelled its earlier decision to allow sugar exports, but even this could not roll back the prices as the demand-supply imbalance had become clear to every one. Production by end-May 1989 was actually less than that in the same period of the preceding year. The crushing season is over now and production is estimated at 89 lakh tonnes against 91.10 lakh tonnes in the previous season.

On the other hand, the internal requirement continues to rise by about seven lakh tonnes a year. On this basis domestic consumption this year can reach about 100 lakh tonnes if it is not restricted artificially to a lower level. This reveals a huge gap of about 13 lakh tonnes between production and demand. In this situation no half-hearted steps can bring back normalcy to the sugar market.

Actually the government should have placed orders for sugar imports right in March when indications were available that the production target of 102 lakh tonnes was going to be a far cry and prices had started moving up. Instead of doing so, it indulged in futile talk of entering the export market. It is now too late to effect immediate imports even if the necessary foreign exchange is made available, as prices of white sugar in the international markets have shot up with Nigeria, China, the USSR and some other countries emerging as big buyers. Knowing full well that the government may not be in a position to import sugar in this situation, the sugar mills and the trade have started urging the government to import sugar, so that the blame for further rise in prices can be laid at the door of the government.

However, there is no escape from imports if sugar prices are to be kept at a reasonable level. If the government means business it should right now enter into contracts for about 12 lakh tonnes of sugar for November-December delivery to cool the domestic market and in the meanwhile start releasing adequate sugar from the existing stock so as to roll back prices. Instead of taking any such step, the government has curtailed the monthly

sugar release and has thus played into the hands of sugar mills. Not only should the cut be restored immediately, but some additional quantity should be released to discipline the market.

The country started the current season with brought-in stocks of about 26 lakh tonnes. This can be run down to meet the immediate demand. However, unless imports are arranged to replenish the stock there may be a further rise in prices even in the coming season, once it becomes clear that the standby stock has gone down sharply and there are no arrangements to augment it.

The industry has of course started clamouring for excise duty concession to start early crushing in the next season. That can yield some additional production in October, but there is no guarantee that the overall production will thereby be higher. Moreover early crushing may lead to low recovery. It is therefore doubtful whether such a step can help the country in getting out of the present predicament. A better way to achieve some tangible result lies in giving some excise concession on the incremental output to those sugar mills which produce more than 112 per cent of their current season's output.

COFFEE

Troubled Brew

SERIOUS trouble has been brewing for the Indian coffee industry ever since the international coffee agreement collapsed about two months ago and the quota system was abolished. The initial optimism expressed by the Coffee Board chairman that the abolition of the quota system may actually benefit India and enable the country to increase its exports by over 50,000 tonnes taking advantage of the 'free market situation' was short lived. For, the prices of the commodity in the world market have witnessed a continuous decline following the abolition of quotas. In spite of the frantic efforts made by the major producing countries to initiate informal talks to maintain prices at reasonable levels, they soon dipped below the 110 cents a pound 'indicator price' fixed by the International Coffee Organisation (ICO) when the quota system was in vogue. In fact the average prices declined to as low as 88 cents a pound by the third week of July.

In keeping with the global trend, prices at the export auctions in India have also nosedived. For instance; prices at Bangalore's export pool auctions slumped by 38 per cent from Rs 650 to Rs 400 per 50 kg. Though the official view is that the prices would recover eventually, the planters are sceptical. They are currently faced with an unprecedented crisis. Karnataka Planters' Association (KPA) and the United Planters Association of India (UPASI) have sounded an alarm of disastrous consequences for the country's Rs 600 crore-coffee industry and have called for immediate fiscal measures to hold the minimum release price (MRP). It is pointed out that some of the competing countries have already responded to the crisis situation by withdrawing taxes on coffee. Planters representatives have advocated a similar action in India by the central and state governments. They want the suspension of excise duty on coffee and slashing the current rate of purchase tax in Karnataka.

India produced a record of 2.16 lakh tonnes of coffee last year but the home consumption was only 60,000 tonnes. The carryover stock from last year's crop is nearly 60,000 tonnes after exporting 97,000 tonnes. The current year's crop is estimated at two lakh tonnes. Last year there was a carryover stock of 30,000 tonnes. Thus the current season commenced with a carryover stock of 90,000 tonnes. Hence the concern and anxiety of the coffee growers is understandable. They are particularly unhappy at the inefficiency of the Coffee Board which has failed to respond quickly to the sudden change in the market scenario. Under the quota system, there was at least a ready and assured market for over one lakh tonnes of coffee to quota and non-quota countries. Now in a free market, the competition is bound to be intense exerting a downward pressure on prices. True, the quality of Indian coffee is superior as compared to many other producers but this claim will not go unchallenged in the changed circumstances. Unfortunately, India's overseas marketing set up is not strong and the Coffee Board has not yet formulated an international marketing strategy to deal with the changed situation. Big producers like Colombia and Costa Rica had foreseen the collapse of the coffee agreement and launched an advertising campaign in the US, the biggest consumer in the world.

Against this background, India will have to reconcile to lower unit value realisation in the overseas markets this year. Holding the prices in the domestic market will also be difficult. Only a few days before the scrapping of quotas, the Indian government had set the domestic sales target by 2000 AD at 1.25 lakh tonnes, as against the current level of around 60,000 tonnes. Now the country may have to achieve this target in a year or two, a formidable task considering the fact that domestic consumption has stagnated around 53,000 to 60,000 tonnes a year during the last decade.

TWENTY YEARS AGO

EPW, August 2, 1969

Government has been too busy with the political and legal aspects of bank nationalisation to start laying down the policy framework and guidelines for a new credit policy that would be closely integrated with the Fourth Plan. Since the major part of bank credit goes to large industry and this position would not be significantly altered in the near future the new credit policy has to be closely integrated more specifically with the approach underlying the Monopolies Bill and the ideas, still very nebulous, about reform of the industrial licensing system and management of public enterprises... To begin at the beginning, capital, even domestic capital, has to be recognised as the most scarce commodity, the allocation of which has to be determined by the most rigorous criteria. Without going into a learned dispute over the relationship between credit and capital, it is necessary that the rate of interest, whether on government or private borrowings, should reflect the scarcity of capital to a greater extent than it does now, and that investment decisions should be made after a careful evaluation of relative priorities and profitability. Investment choices have to be informed with considerations of comparative advantage in terms of international prices. And the time-scheduling of investments has to be arranged in such a manner as to maximise the generation of output and cash receipts within the shortest time... Reforms of this magnitude requires political motivation and direction and they have to be carried out through administrative agencies. Yet, the broad canvas on which the new policy has to be sketched require that persons other than politicians and administrators be involved closely in the framing of issues and formulation of directions. There is need for a compact policy group comprising not more than five members drawn from outside government to assist (not just to advise) the finance ministry, Planning Commission and Reserve Bank in this work. In plain language, this group should be effective (rather than conventionally high-powered) and competent enough to counter both political adventurism and bureaucratic inertia in matters relating to credit planning and industrial policy. Sectoral allocations of credit should, however, be left to a somewhat larger body, comprising the above three official agencies, selected bankers and some professional managers of industry, which should be expected to produce workable plans for implementation by commercial and development banks.

BHARAT GEARS

Recovering from Setback

BHARAT GEARS has suffered a setback in its performance during the 18-month period ended January 31, 1989. Equity dividend, paid at 12.5 per cent for 1986-87, is being skipped. Turnover at Rs 37.12 crore against Rs 21.95 crore for the previous 12 months showed a growth on annualised basis, but the outcome was a decline in gross proft from Rs 2.31 crore to Rs 1.44 crore. After depreciation, there was a deficit of Rs 74 lakh against a surplus of Rs 84 lakh previously. Profit margins dwindled due to rise in costs. Interest and other financial charges took away a much bigger slice of the income.

The current year holds out promise of an improvement in the working results. In view of the management's strategy to diversify the company's market base by exporting about a quarter of its sales volume, the company embarked on a substantial gear development programme which resulted in a loss of productive capacity during the year. This capacity will, however, be available for use in the current year which is expected to result in an increase in sales volume of 20 per cent.

The domestic market for automotive gears, which was sluggish in the beginning of the period, improved towards the close of the year and this trend is continuing in the current financial year. The company's main customers in the segment are agricultural tractor and truck/bus manufacturers who are witnessing an unprecedented boom in their business. This boom will help the company to achieve its targeted increase in sales volume.

Export of gear products recorded a substantial growth of over 300 per cent over the previous year on annualised basis. In the 18-month period, gears worth Rs 700 lakh were exported to USA, UK and western Europe on which export incentives of Rs 287 lakh were earned. The company has entered into a long-term agreement with a large manufacturer of truck/bus axles in USA for supply of axle gears sets valued at $ 6.4 million per annum for a period of five years. The total export potential for the company's products is estimated to be $ 10 million per annum.

The gear box project, set up in technical-cum-financial collaboration with Zahnradfabrik Friedrichshafen (ZF) of West Germany, commenced commercial production in December, 1988. The product has been well received as an original equipment. During the last financial year, the company supplied 235 gear boxes worth Rs 48 lakh to an OEM in India and expects to supply another 1,500 gear boxes by the end of current financial year. A ZF gear box modified for application in a Japanese LCV manufactured in India under licence is under trial overseas, and clearance is expected to be received before the year end. With this, the company expects to reach a sales volume of 5,000 gear boxes next year.

The furnace division executed contracts amounting to Rs 151 lakh during the period and has contracts worth Rs 330 lakh in hand. The company has been awarded a contract against stiff international competition for supply to the World Bank funded modernisation projects of Indian Railways. The gear project of Raunaq Automotive Components, promoted by the company in the joint sector with PICUP, has already been commissioned and its products—gears for two-wheelers, agricultural tractors and trucks—have received encouraging response from the trade as well as OEMs.

GARWARE-WALL ROPES

New Export Markets

GARWARE-WALL ROPES has produced encouraging working results for the 18-month period ended on March 31, 1989. The directors have proposed payment of a 24 per cent dividend on the capital doubled by a one-for-one bonus issue as against 20 per cent paid for the previous 12 months on the old capital. The 'rights' shares issued at a premium of Rs 20 per share are eligible for dividend for the period during which such capital was paid up.

Production reached 8,481 tonnes as against 4,795 tonnes previously, recording an annualised growth of 18 per cent. Sales at 8,575 tonnes against 4,532 tonnes showed 47 per cent growth on the same basis. In terms of value, sales brought in Rs 36.53 crore against Rs 16.60 crore in the preceding 12-month accounting year and yielded a gross profit of Rs 4.21 crore against Rs 2.37 crore. These figures show a contraction of profit margins. Net profit stood at Rs 2.34 crore (Rs 0.98 crore). The enhanced distribution was covered 4.98 times by earnings as against 5.16 times previously.

Despite severe international competition, the company continued to penetrate into newer markets and was able to achieve exports of Rs 8.08 crore as against Rs 2.68 crore in the previous year. The new 100 per cent export oriented unit named as 'Garware-Wall International', a division of Garware-Wall Ropes, has commenced its commercial production on May 15, in line with the planned schedule. With a comfortable order book position in hand and continuous efforts made by the company for enlarging its export potential, the directors are confident of making this new unit

successful. The company also received recognition as registered 'Export House' enabling it now to undertake exports of third party products for which it has been receiving regular export enquiries. With various incentives announced by the central government to the Export Houses, and the encouraging export performance of the company so far, management is confident of further broad-basing its exports.

The company has obtained a letter of intent for the manufacture of polypropylene multifilament yarn to the extent of 2,000 tonnes per annum and necessary steps are being taken to convert the same into an industrial licence for setting up a separate fibre division of the company. The management foresees a good potential for this product and is confident of commencing commercial production in the next financial year. A research and development plant for developing indigenous technology for this has already been installed, successful trial runs have also been taken and the laboratory results are quite encouraging.

FICOM ORGANICS

Expansion Completed

FICOM ORGANICS has turned in good financial results for the 18-month period ended March 1989. The directors have recommended a final dividend of 22 per cent making a total of 60 per cent for the period against 30 per cent paid for the previous 12 months. Turnover at Rs 28.01 crore was higher by 41 per cent on an annualised basis as compared to Rs 13.25 crore in the previous year and total production increased by 32 per cent on the same basis to 7,985 tonnes from 4,040 tonnes. Profit margins, however, shrank and gross profit came to Rs 4.93 crore against Rs 2.95 crore. Net profit stood at Rs 3.69 crore (Rs 2.18 crore) to provide an earnings cover of 4.80 times for the enhanced distribution as against 5.60 times previously.

The company exported 1,173 tonnes of malathion technical, which was about 63 per cent of malathion sales. The company completed erection of its plant facilities for further expansion of alkyl phenols (that is dedocyl phenol and nonyl phenol) capacities. With this expansion, total alkyl phenol capacities increased to 10,000 tonnes per annum. Commercial production from the expanded plant commenced on March 27, and overall production is also well stabilised. The company also entered into a technical know-how agreement with the National Chemical Laboratory, Pune, for the development of process know-how for the manufacture of D-phenyl glycine. Development work is also in progress on this and other projects in the R and D department. The company is also evaluating avenues to take up manufacture of some more chemicals.

Calcutta Diary

AM

The Indian prime minister has readjusted his sights. The nobility cannot be saved in Sri Lanka; it is too late for that. So he might as well use the occasion to effect a little extension of his empire, and annex the island's north-eastern beachheads.

RENDER even unto the pretender of a Caesar the things that belong to him. The Greek tragedy in Sri Lanka is the denouement of a causality which, admittedly, is internal to that nation. Why deny however our prime minister the role of the accidental *deus ex machina* he has come to play? Even without him, Sri Lanka would perhaps have been destroyed as a country, but, hallelujah, has not he speeded up the process?

Please consider, as the cliche says, the objective circumstances. Sri Lanka is a lush, rich island. Outwardly, it has no reasons to go under. The population barely touches twenty million. The island grows enough rice to feed the people, and has plenty of fish and livestock. Tea, rubber and copra offer open-ended prospects of export earnings. And the island's silvery coast, with vast stretches of calm, beguiling water all around, should make the tourists flock in their thousands. The Sri Lankans, besides, are amongst the most charming people to come across, easy-going, friendly, intelligent. There is also so little of the bigotry of diverse kinds which marks their immediate northern neighbours.

Were external assistance not forthcoming, or not forthcoming on a sufficient scale, then too Sri Lanka should have grown at a fast enough rate. There has actually been no dearth of foreign funds. Till the early eighties, the island country did maintain fairly satisfactory progress, and certainly enjoyed a much higher rate of economic growth than what obtained in the so-called third world countries. Partly on account of the exigencies of the parliamentary democratic process, it evolved, through the fifties and the sixties, a sensible package of public policies, with stress on elementary education and public health and nutrition projects. Its programme for expansion of literacy has been about the most enlightened among the south Asian countries; the administration has been trained to devote a great deal of resources to both preventive and curative health care measures; and, much before the World Bank discovered the *cause celebre* of basic needs and poverty eradication, extensive food subsidies were introduced to lessen the burden of daily existence for the country's poor. Each of these measures eminently qualified to be dubbed as 'populist', but in their totality they fashioned an improvement in the general quality of life which stood out in the morose climate of south Asia.

All this could still only establish the point that Sri Lanka was an *enlightened* oligarchy, and not obliterate the fact of its being an *oligarchy*. Farm real estate as well as non-agricultural wealth have been extremely closely held in the island. Since the average living standard was much higher than in India, the grosser kinds of social exploitation common in this country has not been observable over there. But that has not been enough to stop history's remorseless march. Once social awareness spreads, the sense of deprivation sprouts roots according to its own style. Both absolute scales of measurement and cross-country comparisons then lose their relevance; domestic relativities take over. Faithfully reflecting the structure of land distribution, Sri Lanka's political set-up in the immediate post-independence period too provided the hint of a closely held arrangement. The British were habituated to deal only with the landowning class, who also contributed the comprador elements in the trade and processing collaborations that came up. To nobody's surprise, it is to this class the British handed over charge when they left the island. In the beginning, the ruling political group, the United National Party, was, almost exclusively, a cartel of cousins, and very near ones. As happens in all feudal polities, the cousins soon learnt to grow distant. Thus it was that Solomon Bandaranaike drew away from the United National Party, and opened his separate outfit, the Sri Lanka Freedom Party. For the populace, despite their receiving some morsels of incidental benefit because of the happenstance, it was nonetheless tweedledum substituting tweedledee; the basic social correlates remained unchanged. Those handful amongst them, who, via intellection, realised that what obtained was a precarious, unstable equilibrium, could not transgress the boundary conditions imposed by their own class inheritance. Whether it was the Trotskyite Lanka Sama Samaja Party or the more conventional Communist Party, their leaders and pamphleteers did not spring from a different social category. They happened to be ideologically disoriented; in terms of property alignments, however, they continued to belong where the UNP and the SLFP belonged. Their credibility was therefore heavily circumscribed.

By a quirk of fate, in the sixties, these theses-spinners found themselves in government in alliance with the SLFP. The nationalisation programme they embarked upon introduced some colour to the picture. But the texture of social realities remained unchanged. Regular remittances to foreigners were now substituted by once-over compensatory transfers. The compradors nonetheless were now inside the administration; the charade of nationalisation hardly affected their material interests. If anything, it increased their bargaining capability *vis-a- vis* the working class. Certainly it increased their profligacy. The distant cousins, mostly located in the two principal parties, kept indulging in their petty and not-so-petty jealousies. For them, the fundamental point was still to live it up.

The majority of the Sinhalese-speaking populace were left out of the arrangement because they constituted the base, which is supposed only to provide support, not share. Apart from a thin stratum of those who managed to infiltrate into the civil service, the Tamils too were left out. The Tamils in any case did not quite fit into the established class hegemony. Those amongst them who went in in the last century of course mostly went in as indented labour. Those who had been around Jaffna and Vavuniya and Batticoloa for nearly five centuries did not ever begin to belong either. They turned out to be the perennial outsiders. It was thus a two-bit misfortune. Even those who made money from trade could not buy their way into the Sinhalese plutocracy. More because of the accidental barrier of separate religious rituals than on account of the linguistic

divide, they continued to be differentiated from the Sinhalese-speaking proletariat too. The haughtiness carried south from across the Palk Strait perhaps partly helped to perpetuate the divide.

History marches, and it marched in its own manner in Sri Lanka through the post-independence decades. The island's comfortably placed, whichever political party they formally belonged to, did not have a clue to what was happening either in the countryside or in Colombo's outlying shantytown. When the Janatha Vimukti Peramuna struck in 1971, Sirimavo Bandaranaike panicked. Her reaction was not that of a besieged individual, or of just one political party played into a corner, it was that of the entire Sri Lanka ruling class. Sirimavo appealed to Indira Gandhi; it was a consolidated class appeal. If, instead of her, Junius Jayewardene had been in charge at that particular moment, he would have behaved exactly in the same way. Jayewardene proved the point sixteen years later; the IPKF went in, not to discipline the LTTE, who are devoid of any class ideology, but to save the oligarchs from the revolutionary insurgency unleashed in the island's south.

This underlies the dilemma Sri Lanka is currently facing. The oligarchy has crumbled within the United National Party, as it has in the SLFP too. The plutocrats in the island are running for cover. The Premadasas and the Kumaranatungas, plain commoners, could come up in the conventional boss parties because the bosses are frightened beyond measure. A plebeian Premadasa or an upstart like Vijaya Kumaranatunga—who was gunned down last year—, the plutocrats tried to convince themselves, might somehow subdue JVP firepower and save the day for them. It is a bitter comedown for them. But these are difficult times, insurrectionary times, whoever can roll the revolution back and protect their property rights deserves to be acclaimed as president or prime minister. Humour the poor, bribe them a little if that would enable you to cling to your privileges—and to your property.

Such calculations however do not impress the dull boys from the World Bank and the International Monetary Fund. Their political acumen has been honed in the blunt school of Ronald Reagans and Bill Caseys, and their sense of humour belongs to the world of the *Readers' Digest*. They have read only a single script. Subsidies, it has been dinned into them in downtown Washington, are bad, and subsidies to the poor are particularly bad. They have been determined not to deviate from the line. Social realities underlying an insurrectionary situation mean little to them. The Sri Lanka government has, as a result, been confronted with a nightmarish problem for the past several years running: the defence budget has continued to soar, but with the Bank and the Fund enforcing the regime of the tight leash, fiscal dispensations for the poor have actually been further cut back even as prices have mounted. As a natural process, the support base of the Janatha Vimukti Peramuna has expanded at a furious pace during the past half a dozen years.

Sri Lanka's internal compulsions do not impress the Indian prime minister either. The deep calls to the deep; the deep also responds to the deep. The quality of response is bound to be different when the appeal is from the non-deep. Indira Gandhi moved her navy and her commandos because the frantic appeal was to save a class hegemony, the class to which she herself belonged. Her son arranged to fly in troops two seasons ago because Junius Jayewardene once more had appealed to him on behalf of the ruling oligarchy; what could be more proper than the oligarchs of the region protecting each other looking after each other's welfare? But the Indian prime minister now feels betrayed. The Sri Lankan ruling class did not avail of the opportunity the IPKF provided to them. They caved in to the riff-raff. Junius Jayewardene is gone; they have installed in his place as their president a commoner who lacks in breed and manners, and does not quite belong. Nothing could be more disappointing.

Ranasinghe Premadasa is making one last ditch effort. He is still trying to save the system which has been kind to him as an individual. If only the IPKF would now *withdraw*, he could, he thinks, still extricate the existing social order from certain death. The Indian prime minister is unmoved. It is no longer the same thing as it was two years ago, the Sri Lanka oligarchs are a burnt-out case, they have replaced a Junius Jayewardene by a miserable Premadasa. They are beyond redemption, therefore why bother to spare a thought for them?

The Indian prime minister has readjusted his sights. The nobility cannot be saved in Sri Lanka; it is too late for that. It is a pity, but something still needs to be salvaged from the Sri Lanka fiasco. He might as well use the occasion to have a little extension of his empire, and annex the island's north-eastern beachheads. Let there be chaos and revolution in the rest of the country, the IPKF will see to it that one corner of Sri Lanka receives the quintessential benefits of India's democratic process. Why, if things proceed swimmingly, one might even consider introducing the Jawahar Rozgar Yojana over there; vacuity should never set on the Indian empire.

Detention of Legislators

A G Noorani

Our legislators have been aggressive in claiming privileges against the people, supposedly their masters, but they have been quiescent in asserting their privileges against the ministers responsible to them. However, the irony may be more apparent than real.

STRANGELY enough, while our legislators have been very assertive in claiming imaginary legislative privileges against their own masters, the citizens, they have been quiescent in claiming their real privileges against their servants, the ministers responsible to them. The irony is more apparent than real. The ruling party controls the legislature and our legislators have not developed the tradition of viewing such matters independently on principle.

On May 12, Yashwant Sinha of the Janata Dal raised in the Rajya Sabha a breach of privilege question against the Chandigarh administration on his arrest and detention in the city recently. He regretted that home minister Buta Singh did not do anything about this deliberate contempt on the face of the administration. The deputy chairman informed the house that the secretary-general of the Rajya Sabha was looking into the matter. Dipen Gosh, CPI(M), pointed out that this was a serious matter. A member of parliament had been arrested and the minister concerned at the centre had not even reacted to it for two months.

L K Advani, BJP, said the issue had been raised in the house three times. Still nothing had been done. In fact, the arrest of a member is such a serious matter that in the normal course the chairman should have taken *suo motu* notice of it. Advani demanded that the Chandigarh administrator should be called before the privileges committee for explanation.

This is not a matter which can be treated lightly. In India the law affords little protection against arbitrary imprisonment. The governor of Punjab, S S Ray, and the central ministers have shamelessly suggested that Parkash Singh Badal would be released from prison if he changed his views on the present situation in Punjab. What if the regime of the day were to arrest opposition legislators and rush through repressive legislation as was done during the Emergency?

In 1962 the Madras High Court observed in the case of K Anandan Nambiar: "We, however, readily concede the contention that if a party in power detains a political opponent or continues his detention with the *mala fide* object of stifling opposition and prejudicing the party to which he belongs in a forthcoming election, *there would be an undermining of the basis of our constitution*" (emphasis added). Yet the Court held that Nambiar could not be allowed to attend the sittings of the state assembly since he had been detained under the Preventive Detention Act. The Supreme Court took the same view in Anandan Nambiar's case in 1965. It reaffirmed this view in 1975 in Indira Gandhi's election case when the legislation validating her election was challenged on the ground that parliament had been robbed of its constitutional composition by reason of the large-scale arrest of opposition MPs. The court simply followed its ruling in 1965 and that ruling blindly followed the case of Captain Ramsay in 1939 when the Committee of Privileges of the House of Commons declared the law in these terms: "The precedents lend no support to the view that the members of parliament are exempted by privileges of parliament from detention under Regulation 188 of the Defence (General) Regulations, 1939. Preventive arrest under statutory authority by executive order is not within the principle of cases to which the privilege from arrest has been decided to extend. To claim that the privilege extends to such cases would be either the assertion of a new parliamentary privilege or unjustified extension of an existing one."

The truth is that the Committee of Privileges of the Commons did not act judicially in that case at all but as a political body surcharged with the understandable fever of the war. Few sympathised with Captain Ramsay. He was widely suspected of being a fascist collaborator. The clerk of the House of Commons, the redoubtable Sir Gilbert Campion, cited precedents. Those were the cases of obstructive Irish MPs some of whom had not taken their oaths or their seats in the house. Terrorism in Ireland and obstructionism coupled with partisanship produced a bad precedent.

The precedent was followed in 1939 in Britain and in 1965 and 1975 in India. However, the report of the Committee of Privileges in 1939 was *not examined* by the court. If it had been, instead of a passage in May's *Parliamentary Practice* based on it, it would have been found that the home secretary had stated on oath before the committee that Captain Ramsay had not been detained for anything said in parliament. He had also affirmed on affidavit before a court of law that he was personally satisfied as to the grounds of detention. The report observed: "If the real ground of internment had been that the member was likely to prove an embarrassment to the executive in parliament no such affidavit could have been sworn without the commission of gross perjury."

Can anyone doubt for a moment that such "embarrassment to the executive in parliament" is the very reason why MPs are arrested in India? What is more, in India, unlike in England during the height of the war, persons are detained not on the personal satisfaction of the home minister accountable to parliament, but of district magistrates and commissioners of police.

Despite the cosmetic changes made by the 42nd and 44th Amendment to the Constitution, the law of parliamentary privileges is frozen to what British law was on January 26, 1950. Article 105 of the Constitution originally reads thus:

> (1) Subject to the provisions of this Constitution and to the rules and standing orders regulating the procedure of parliament, there shall be freedom of speech in parliament.
> (2) No member of parliament shall be liable to any proceedings in any court in respect of anything said or any vote given by him in parliament or any committee thereof, and no person shall be so liable in respect of the publication by or under the authority of either house of parliament of any report, paper, votes or proceedings.
> (3) In other respects, the powers, privileges and immunities of each house of parliament, and of the members and the committees of each house, shall be such as may from time to time be defined by parliament by law, and, until so defined, shall be those of the House of Commons of the parliament of the United Kingdom, and of its members and committees, at the commencement of this Constitution.

The court, therefore, has in each case to consider the rights of an MP in Britain. It is well settled that he enjoys freedom from arrest in civil cases but none so far as criminal proceedings go.

The 42nd and 44th Amendments delete the reference to the House of Commons but retain the legal position intact. British law of privileges prevailed in 1952 in Deshpande's case. The committee of

privileges of the Lok Sabha characterised preventive detention as being "in its essence as much a penal measure as any arrest by the police or an order of the magistrate on suspicion of the commission of crime".

This is utterly wrong. In 1969 the Supreme Court knocked the bottom out of this doctrine. It said:

> It must be emphasised that a detenu is not a convict. Our Constitution, notwithstanding the broad principles of the rule of law, equality and liberty of the individual enshrined therein, tolerates, on account of peculiar conditions prevailing, legislation which is a negation of the rule of law, equality and liberty.
>
> But it is implicit in the constitutional scheme that the power to detain is not a power to punish for offences which an executive authority in his subjective satisfaction believes a citizen to have committed. Power to detain is primarily intended to be exercised in those rare cases when the larger interest of the state demands that restrictions shall be placed upon the liberty of a citizen curbing his future activities. The restrictions so placed must, consistently with the effectiveness of detention, be minimal.

Why, then, should not a legislator be permitted to attend the proceedings of the legislature even if he be under preventive detention? Besides, Article 105 is controlled by the fundamental right to personal liberty embodied in Article 21 of the Constitution. If this be the law in relation to an MP or MLA in preventive detention, the wrong done to Yashwant Sinha is graver still.

POTOMAC MUSINGS

Craving for the Philosopher's Stone

Deena Khatkhate

Even when all his diagnoses and prognoses have been proved wrong, the economist can still be trusted to provide ex post facto *rationalisations for every new economic development, however contrary to his earlier expectations it might be. A case in point is the economist's continuously shifting position on what constitutes an appropriate international exchange rate system.*

LOOKING at the advice economists of all hues are dishing out to all and sundry, you may be forgiven if you call them pests. And yet you cannot avoid them. They are a draw at every cocktail party. You can bank on them to razzle-dazzle. While a loquacious economist is going full steam in a crowd, a quiet but scholarly physicist may be wanting to say how the fusion of atoms could be an answer to the world's energy shortage or a biologist may be itching to explain how genetic engineering could banish many dreadful diseases or render barren land fertile. But the economist will carry the day. The trail blazing scientist may change the world one day but he cannot sell himself; he has no audience. The economist doesn't care a dime for the world; he creates his own universe with his own brand of laws, but be never has to worry about an audience. He can talk about food prices, jobs, the stock market and about politicians and businessmen, whom he can impress with his bag of tricks. The immediacy of what he says is the real thing for you and me. If his diagnosis and prognosis go haywire, he can shelter behind the plea that objective conditions have changed. He can change his advice and theories as easily as a chameleon can change its colours.

Why the snide remarks about the poor economist, you may ask. The provocation is the recent behaviour of the dollar exchange rate. We have been fed on the lore of market forces determining exchange rates. If you stop interfering with people's decisions of what to produce and what to buy, everything will be hunky-dory. We will be in a state of Pareto optimality. After the second world war, the wiseacres got together at Bretton Woods and set up a par value system. Exchange relationships between currencies were ordained. Were they market determined? You should not ask such silly questions. They were the equilibrium exchange rates. You could alter them only if you perceived a 'fundamental disequilibrium'. What is this animal, 'fundamental equilibrium'? Nobody knew and nobody cared, but everyone believed it existed. Fundamental was what was not non-fundamental and disequilibrium was what was not equilibrium. This knowledge was enough for you to decide if the exchange rates needed to be changed. Look at the balance of payments position and, if it is in deficit, see whether the deficit is sustainable. What on earth is this notion of sustainability? See whether the deficit is filled by the normal inflow of autonomous capital. If you are still in doubt about what is normal, stop playing Socrates and change the exchange rate at once.

The moment of truth arrived in 1971 when the whole edifice of international exchange rates came crashing down. But the indefatigable economist would never say "nay". Floating exchange rates are the panacea, he thundered. If you follow the inflation differentials among nations, you will know what value the currency of any country will take on. The resulting exchange rates together with the differentials in interest rates will then determine the capital flows across nations. But, once again, the floating exchange rates regime belied everything the economist had been preaching. Capital did not follow the course charted by interest rate differentials. In fact, it happened the other way round. Interest rates and exchange rates followed capital flows. The chaotic international economic order became more chaotic. The major industrial powers thought of orderly conditions in the exchange markets only when they were sucked into a recession. But the economist is never assailed by self-doubt. He was back with a new prescription, economic co-ordination. Exchange rates are the penumbra and fiscal and monetary policies are the umbra. If countries follow the right fiscal and monetary policies, exchange rates will move along the equilibrium path. None ever asked the economist whether co-ordination of policies did not

offend the market principle. If the exchange rates veer away from the levels dictated by the 'fundamentals', the major industrial countries—be they G-5, G-7 or G-10, depending upon who can get in—should allow intervention by their central banks to stabilise it within a 'target zone'. Mr Fundamental is thus back in the economist's circus ring, with the difference that now he has become a friend unlike in the era of fixed par values. Despite invoking this personage time and again, no economist has ever succeeded in identifying him. The economist just believes that he exists in some form somewhere, pulling the strings in the puppet-show of exchange rates gyration.

But the economist's predicament has once again become acute with the recent soaring of the US dollar to new heights. The deficit in the US balance of payments is large and widening, the US budget deficit is also stubbornly large and inflation is rising. All these should signal depreciation of the dollar. Imagine what would have happened if these things had occurred in some unfortunate developing country. It would have been promptly pulled up by the international organisations and the economists and advised to devalue. But how can you ask a country which is a reserve currency country to follow this theoretical prescription. So the economist is left with an *ex post facto* rationalisation. Martin Feldstein, former chairman of the Council of Economic Advisors under president Reagan, who had all along advocated elimination of economic co-ordination of policies by the industrial countries, pronounced that "the dollar's rise is bewildering. The market is as far as I can see irrational in terms of the fundamentals and not driven by any particular economic view, since its theory of how to rationalise dollar swings seems to change every few months." The learned professor could not explain why exchange market analysts who had been saying that "inflation was good for the dollar because it would induce the Federal Reserve to raise interest rates, increasing the return on dollar investments" had now switched to saying "the weakening of inflationary pressures was positive for the dollar because rising prices are bad for currencies". These befuddled professors may have learned more from the magnificent 'Impossibility Theorem' of Kenneth Arrow, which got him the Nobel Prize. But it is futile to expect the lofty economic theorists to confess their ignorance; If they did, they would be an extinct species.

And yet the poor developing countries cannot escape the omniscient economist and his advice to devalue when they run payments and fiscal deficits and experience inflationary pressures. If devaluation does not succeed, they will be told that their domestic fiscal and monetary policies are at cross purposes with their exchange rate policies. Poor countries do not have the luxury of co-ordinating their economic policies with those of other countries, rich or poor. With the rich countries, such co-ordination amounts to unequal exchange and is therefore out of bounds. And with other poor countries, what purpose is anyway served by an alliance of mendicants? Hence developing countries deserve not co-ordination but coercion. They can be asked to auction foreign exchange or, worse, float their currencies. And if disaster strikes them, as has happened to some countries in recent times, the economist can attribute it to some other policies pursued by these countries. In the army, if a general loses a war, he is cashiered, but the economist has no such fear.

Paranoia in Beijing

GPD

The students asking for prime minister Li Peng's resignation was in all probability the main factor which caused the paranoia in Beijing. Deng and his comrades must have seen nightmares of the Cultural Revolution when the slogan was 'bombard the headquarters'.

TWO general secretaries sacked in a span of three years speaks volumes about the nature of the counter-revolutionary rebellion in China. Hu Yaobang lost his job because the students had organised a movement which spread to thirteen cities of China. Now Zhao Ziyang has been dismissed. He may also be put on trial.

It is clear that there has been students unrest in China for over three years now. The broad contours of their demands have been quite explicit. These demands have been a reaction to the Cultural Revolution and the strong anti-intellectualism which it bred. Both Deng Xiaoping (and his comrades) and the students/intellectuals have been coming to terms with the rather torrid legacy of the Cultural Revolution. It is a paradox of the Chinese situation that for the first time in many decades intellectuals and intellectual pursuits have been given their due place. This has happened after 1978 and after Deng Xiaoping had finally emerged as the supremo in the Chinese power structure. When Deng talks of revolution he is talking of an intellectual and technological revolution. He is also talking of a 'modernist' revolution.

When the new economic policy was introduced in the Soviet Union, Lenin talked of a retreat. Deng has carefully avoided that language. It is not possible to describe what he has been doing as a historical compromise, a temporary setback, for the simple reason that Deng Xiaoping does not use that language. He has in fact ruled out the possibility of the current collaborationist course being reversed in the next fifty years. In his speech on June 9 to the PLA commanders, Deng talked of revamping education. The time-limit, obviously on the minimum side, that he specified was sixty to seventy years. The proposed education programme would concentrate on "plain-living" and obviously on the economic policies that were first introduced nearly eleven years ago.

In the meanwhile, the Chinese leadership has tacitly acknowledged that the army-people interaction at the Tiananmen Square on June 4 did not demonstrate what Deng claimed in his June 9 speech—that "people cannot but recognise that the PLA are the sons and brothers of the people". Li Peng, the Chinese premier, has claimed that the PLA ran out of teargas on June 4. He also further stated that the army ran out of rubber bullets and had to use real ones. Of course, the official Chinese position is and has been that the students attacked the army. Deng in fact instructed the commanders of the army that they should "make sure that our weapons are not taken away from us". The PLA commanders allowed their weapons to be taken over. But not all weapons seem to have been snatched. Some soldiers had their weapons but what they did not possess was the supply of rubber bullets; so they fired the real ones. So a few people died. The Chinese authorities say only twenty-three died. Hong Kong papers, not all of whom can be relied upon (certainly not *Ming Bao*), put the figure in thousands. Now American newspapers have computed the figure of dead between four hundred and eight hundred.

Even Deng Xiaoping does not deny that students have been killed. In his speech on June 9 Deng Xiaoping said, "the US berates us for suppressing students. But when they handled domestic students' unrest and turmoil, didn't they send out police and troops, arrest people and shed blood? They were suppressing students and the people, but we are putting down counter-revolutionary rebellion". He does not deny blood-shed and killings. All that he says is that whereas the Americans were killing people, his comrades have killed counter-revolutionaries. In short, you can kill provided you are careful to brand your victims as counter-revolutionaries.

Deng Xiaoping's message is clear. What the party leadership does is only a compromise; what the students were indulging in was a counter-revolutionary rebellion. Deng has even tried to bring in historical determinism in his address. He said that what has happened "was bound to happen and was independent of man's will". It is interesting that Deng is talking this language. If the "counter-revolutionary storm" was inevitable what policies or what economic realities made it so? Lack of "political work and education" apparently resulted into this storm independent of human will. "Upholding four cardinal principles and persisting in the open policy and reforms" that the CPC has held dear since the 13th Party Congress were right. And yet the storm burst out into the open.

Deng has also said that the people who had gathered at the Tiananmen Square had "two main slogans: To overthrow the communist party and topple the socialist system". What is the evidence for it? Deng has not cited any in his speech. The students' demands either of 1986 or of 1989 do not suggest that Deng is right. As we pointed out the last time, the students asking for the prime minister's resignation was in all probability the main factor which caused the paranoia in Beijing. Deng and his comrades must have seen nightmares of the Cultural Revolution when the slogan was 'bombard the headquarters'. The moment the nightmare was seen, the students became ten-feet tall monsters out to destroy the 'socialist' system. Once this perception came to stay what happened was "inevitable" and, in a manner of speaking, "independent of human will".

Anyway Deng Xiaoping and his comrades will carry on with their versions of the happenings of June 4 and since. They would do so with an element of injured innocence. But their lies and half-truths should not blind us to the great hypocrisy of the heads of the seven rich nations of the world who had gathered at Paris. These people, especially the Americans and the British, have no qualms about trying to resist proposals for sanctions against South Africa. The number of people whom the Americans have killed across the three coloured continents should invite the worst reprisals. The South Koreans beat and kill their students every alternate month. Nobody proposed sanctions against them; certainly not the big seven. Why then sanctions against the Chinese?

Deng Xiaoping should have known the hypocrisy of those to whom he has told thrown his country open. He obviously did not. It is good that he has told some plain truths to the Americans. The Chinese treatment of the students cannot be justified. Equally the holier than thou attitude of the big-7 cannot be justified either. The only difference perhaps is that Bush may well argue that his countrymen have not killed Europeans and Americans. They have killed only coloured people. The Chinese have killed their own people. So there is no real comparison. One wishes Deng Xiaoping and his comrades import at least one influence from the west: Never kill your own people. Disarmament for the white people, war for the coloured lot. That is the division which works. The Chinese must reverse that or scrap it altogether. Unless that happens, they will make the traditional killers proud of their systems and put themselves on the defensive.

Decay of Parliamentary Institutions in India

P A Sebastian

A journalist's report on corruption in the secretariat of the Maharashtra legislature has been held to be a breach of privilege which lowers the prestige of the legislature. The episode is indicative of the rapidly deteriorating state of institutions of parliamentary democracy—legislatures, courts of law, criminal investigation agencies, etc—in India.

IN July, 1987 N D Patil, an MLA of the Peasants and Workers Party and Digvijay Khanvilkar, an MLA of the Congress(I) accused each other on the floor of the Maharashtra Legislature of stealing a question belonging to the other. Intrigued by the allegation, Prakash Gupta, a reporter of *Navshakti*, investigated the matter and found to his consternation, that the staff in the secretariat of the Maharashtra legislative assembly were steeped in corruption and some of the MLAs were accomplices in the racket.

Questions, half-an-hour discussions, calling attention motions and such like are the devices to bring people's problems before legislatures. They are first submitted to the secretariat of the legislature. It is alleged that the staff in the secretariat of the Maharashtra legislature manipulate such things when they are submitted by the MLAs who are not well known and not very vociferous. The MLAs ask the parties whose interests are involved in the matter to go and meet the staff concerned. If a deal is struck then the matter appears before the legislature. If not the matter may vanish into thin air. This was the burden of Gupta's article in *Navshakti* which appeared on July 20, 1987. On the same day a motion for breach of privilege was moved in the legislature against the reporter. The motion said that the article interfered with the functioning of the legislature and defamed the chairperson and the members of the legislature. The special privileges committee held that Gupta was guilty and punished him with thirty days' imprisonment which both the houses of the legislature commuted to a warning on April 26, 1989.

The episode is indicative of the decay of the institutions of parliamentary democracy in India such as the legislatures, the courts, the commissions of inquiry and criminal investigating agencies. The action of the legislature seems to suggest that corruption may not lower the prestige of the legislature, but its disclosure may. The legislature does not appear to be agitated over the substantive issue and to have made an attempt to inquire into the charge of corruption and to have taken remedial measures, but it has censured the one who reported it. This is indeed a strange concept of prestige. Can one demand prestige as a matter of right and enforce it at the pain of punishment?

The members of the Tamil Nadu assembly assaulted and molested each other. If one applies the logic of the Maharashtra legislature, it will mean that the mutual belabouring indulged in by the members did not taint the prestige of the TN legislature while reporting it in public did. Rajiv Gandhi treated the members of the parliament as less than honourable when he misled them by falsely claiming there was an SIT report which exonerated Dhawan of the charge of conspiracy to assassinate Indira Gandhi. But the parliament has not punished him for contempt of the house.

The other institutions of parliamentary democracy do not acquit themselves any better than the legislatures. The Supreme Court was supposed to decide the validity of the interim order in the Bhopal gas disaster case. Instead, the court transferred to itself all the cases, both civil and criminal, and quashed them in terms of an apocryphal settlement. This decision flew in the face of the laws and precedents. The court had struck down its own order in Antulay case whereby the corruption case against him had been transferred to the high court from the sessions court, because it discovered that it had no power to do so. From where did the court acquire the power now to do the same thing, which, it said, it did not have, not so long ago? Does the law vary in accordance with the colour and wealth of the litigant?

The government had assumed power to represent the gas hit under the Bhopal gas leak disaster (Processing of Claims) Act, 1985. Some of the gas hit had challenged in the Supreme Court the constitutional validity of this law. The court acted on the basis of a settlement signed by the government on behalf of the victims, whose power to do so was under legal challenge. The propriety and the judicial wisdom demanded that the court should have first decided the constitutional validity of the Act before it took such a momentous decision which affected thousands of people. A five-judge bench of the Supreme Court had held in the Shriram case: "When an enterprise is engaged in a hazardous or inherently dangerous activity and harm results to anyone on account of an accident in the operation of such hazardous or inherently dangerous activity resulting, for example, in the escape of toxic gas, the enterprise is strictly and absolutely liable to compensate all those who are affected by the accident and such liability is not subject to any of the exceptions *vis-a-vis* the tortuous principle of strict liability. In such a case, the measure of compensation must be correlated to the magnitude and capacity of the enterprise because such compensation must have a deterrent effect. The larger and more prosperous the enterprise, the greater must be the amount of compensation payable by it for the harm caused on account of an accident in the carrying on of the hazardous or inherently dangerous activity by the enterprise." This was not a very revolutionary doctrine enunciated by the Supreme Court for the first time in its history. The privy council had said so about a hundred years ago. The absolute liability meant in the instant context that Union Carbide had to compensate fully for the damages incurred by the victims, irrespective of whether the gas escaped because of its fault or not. But the court evaded, in the case of Carbide, a decision on this issue. Besides, there was the question of punitive damages for negligence which is an accepted principle in the US while it is in a nascent stage in India. The Carbide case gave the highest court an opportunity to take definitive decisions on all such vital issues which would have had a tremendous impact in the future.

The reason given for the court's refusal to determine such issues on the basis of principles was two-fold: (1) the case would have taken several years because of back-log of cases in Indian courts, and (2) there was no guarantee that the American judiciary would have accepted and implemented the decision of the Indian courts. Neither argument will stand the test of reason. Regarding the first argument, there was nothing to prevent the court from constituting a special bench to deal exclusively with the Carbide case. Anyway, the court has already spent about three months on this case now. And it may take several months more. If the court had decided to spend this much time at the first instance itself, it could have done so without getting involved in unseemly controversies and legal wrangles which may provide the US courts with a reason to say that the Indian courts have not complied with the due process of law. The second argument is equally untenable. The comity of nations would have entailed that the US courts enforced the Indian decisions.

When the highest court bungles such an important issue so badly, how can the courts command the respect of the people—how can they maintain and enhance their own

prestige? Now, who has lowered the prestige of the courts and who has interfered with the course of justice—the people or the course themselves? In the history of independent India there is no other single incident which has mangled the Indian judicial edifice as badly as the performance of the Supreme Court in the Bhopal case. The cuts and tears are entirely self-inflicted. Rightly or wrongly, people today believe that the judges of the Supreme Court indulged in wheeling and dealing behind the curtain along with the officials of the Indian union and Union Carbide.

There are several instances in which the Indian courts have not crowned themselves with glory. E M S Namboodiripad was charged with contempt of court for a statement made when he was the chief minister of Kerala. Upholding the charge of contempt against Namboodiripad, the Supreme Court said in 1970: "When, therefore, a person charged the judiciary as 'an instrument of oppression' and the judges as 'guided and dominated by class hatred, class interests and class prejudices, instinctively favouring the rich against the poor', it is clearly an attack upon judges calculated to raise a sense of disrespect and distrust of all judicial decisions. It weakens the authority of law and law courts and the person is guilty of contempt of court. That the person did not intend any such result cannot serve as justification."

It is illuminating to contrast the judgment in Namboodiripad's case with the judgment in the Shivshankar's case delivered by the Supreme Court in 1988. P Shivshankar, the then minister for law and justice addressed a meeting of the Bar Council of Hyderabad on November 28, 1987 and said: "The supreme court composed of the elements from the elite class had their unconcealed sympathy for the haves, i e, the zamindars. As a result, they interpreted the word 'compensation' in Art 31 contrary to the spirit and the intendment of the constitution and ruled the compensation must represent the price which a willing seller is prepared to accept from a willing buyer. The entire programme of zamindari abolition suffered a setback..." He further stated: "The Maharajas and the Rajas were anachronistic in independent India. They had to be removed and yet the conservative elements in the ruling party gave them privy purses. When the privy purses were abolished, the Supreme Court, contrary to the whole national upsurge, held in favour of the Maharajas." The minister also said: "Madhadhipatis like Keshavananda and zamindars like Golaknath evoked a sympathetic cord nowhere in the whole country except the Supreme Court of India. And the bank magnates, the representatives of the elitist culture of this country ably supported by industrialists, the beneficiaries of independence, got higher compensation by the intervention of the Supreme Court in the Cooper case. Anti-social elements, i e, FERA violators, bride burners and a whole horde of reactionaries have found their haven in the Supreme Court."

Namboodiripad's critique of the judiciary was theoretical and ideological. It was only a reiteration of some of the basics of Marxism. And Marxist ideology has not been prescribed in India. But Shivshankar concretely charged the Supreme Court with bias and prejudice against the poor and instinctive favour for the rich.

Disposing of contempt proceedings against Shivshankar, the Supreme Court said: "While respectfully accepting the ratio and the observations of the learned chief justice made in that decision (Namboodiripad's case), we must recognise that times and clime have changed in the last two decades. There have been tremendous erosion of many values..." Strange logic indeed. The values have eroded, so Shivshankar could denigrate the judiciary with impunity! The court added: "After all in cannot be denied that the pre-disposition or subtle prejudice or what in Indian language is called *sanskar* are inarticulate major premises in decision-making process. That element in the decision-making process cannot be denied, it should be taken note of." And the court concluded: "If any one draws attention to this danger and aspect and measures an institution by the class content, he does not minimise its dignity or denigrate its authority... The minister's statement does not interfere with the administration of justice..." The retreat was complete.

The only difference between Namboodiripad and Shivshankar is that the former meant what he said about the class content and its bias whereas the latter only simulated. Can anyone blame people now, if they conclude that the courts have two measures in their shop of justice?

The commissions of enquiry were meant to deal with complex situations in which unlawful acts have been committed and the executive is not, or does not seem to be, fair and impartial. But this institution has been abused for mala fide and extraneous reasons, one need not dwell upon the past performance of such commissions as Bhargava commission to drive the point home. The recent examples will clinch the issue. The Misra commission came in handy to whitewash the crime of those who committed pogrom in the first week of November, 1984. One instance will suffice to make the point clear. An affidavit filed before the commission had two lists attached to it—one consisted of the names of very prominent Congressmen who are said to have instigated and mobilised the assailants and the other the names of some minor Congress functionaries. The commission totally ignored the first list as if it did not exist while it recommended action against the minor workers! The Thakkar Commission broke all the norms and did a command performance. It is widely believed that Thakkar pointed 'the needle of suspicion' at Dhawan to suit the political requirements of a particular clique in the Congress Party. The Thakkar-Natarajan commission is another instance. It went on a witch-hunting to censure the political opponents of the regime. Very often a commission of enquiry is appointed as an agency of political expediency to defuse the situation and thereby to sweep the ugly incidents under the carpet rather than to investigate and punish the guilty. In late 1982, there were widespread communal riots in Meerut, in which over a hundred and fifty people lost their lives. The Provincial Armed Constabulary of UP actively participated in the riots, it was alleged. The government appointed Justice C D Parikh as a one-person judicial commission to enquire into the riots. The commission was ultimately wound up in late 1988. It is not known what the outcome of the commission was.

Criminal investigating agencies are the bed-rock of criminal justice. They are meant to be scrupulously impartial and fair. But to-day we see an alarming spectacle of misuse of the investigating agencies. It is said that the murder of Syed Modi was used to 'fix' Sanjay Singh. Justice Thakkar pointed out R K Dhawan as the principal suspect on the basis of material produced by a special investigating team of the Delhi police. The same team had no compunction in 'exonerating' Dhawan when political expediency demanded it.

The institutions of parliamentary democracy in India have degenerated to such an extent that they are no longer effective instruments through which people can articulate their grievances and demands. The situation is comparable with that in China in a crucial aspect where the all-encompassing Communist Party became moribund and the people had to find new avenues outside the frame-work of the party. Probably the situation is ripe in India for a people's movement to break out of the existing framework, as is being witnessed in China today.

CALCUTTA

Public Health Services in a Mess

Ashim Mukhopadhyay

The appalling state of public health services in Calcutta has been highlighted once again, this time by the mass deaths of new-born babies at the Calcutta Medical College and Hospital because of, according to the official explanation, "overcrowding".

THE death of nineteen new-born babies at the Calcutta Medical College and Hospital (CMCH) and the consequent mudslinging between the state health minister, Prasanta Sur, and the health department on one side and the West Bengal Health Service Association and the so-called medical cell of the Congress(I)'s student front on the other during the last week of July reveal the callousness of those whom the people had entrusted with the responsibility of looking after public health. According to Sur, this unprecedented spate of infant deaths was caused by the overcrowding of the hospital's maternity wards following temporary closure of admission of expectant mothers to the NRS, another major hospital in the city, where a tetanus case had been recently detected. The situation deteriorated so much in the CMCH that at one time three or four mothers were found sharing the same bed with their babies. The overcrowding also made the existing staff shortage more acute with a single nurse looking after scores of women and infants, besides turning the entire surroundings extremely unhygienic. While taking measures to tackle the problem, Sur also constituted an eight-member committee to probe into the infant deaths and fix the responsibility.

However, Sur was practically mobbed by a group of women, reported to be Congress(I) supporters, and a few representatives of the medical cell of the Chhatra Parishad while opening a new nursery at the CMCH on July 28. Next came a strong protest from the Health Service Association, West Bengal, that straightaway held the state health department responsible for the tragedy and labelled the setting up of the inquiry committee as eyewash.

The truth that emerges from these claims and counter-claims is that the state health ministry and the state government as a whole have failed in the sphere of public health. Two horrendous events were reported last year of new-born babies being actually carried away by stray dogs from inside hospital wards in broad daylight and devoured. Mothers wept, relatives demonstrated and the authorities promised compensation and inquiries. Nothing was heard thereafter. Meanwhile stray animals still roam freely in the hospitals. The callousness of the health ministry was again revealed when about one thousand bottles of blood, donated by volunteers for the setting up of the Bakreswar Thermal Power Plant, had to be destroyed due to inadequacy of storage facilities. Sur and his men had tried to suppress the incident.

Almost a year ago, the people of Calcutta witnessed a macabre tragedy. Hundreds of men, women and children at Behala in the south-eastern part of the city fell sick after eating food cooked in rapeseed oil and doctors diagnosed their ailment as paralysis. According to information with the ministry of health, a very poisonous chemical called TC Phosphate, normally used in making aero fuel, had been mixed with the cooking medium at a local ration shop. In the past there had been complaints of similar malpractices against the same shop. As happens in such cases involving a large number of people, the exact figure of persons affected is still a matter of debate. Nevertheless it can be said that more than two hundred people were permanently crippled. While anarchic conditions prevailed in the local hospitals, ministers and senior officials of the health, food and municipal affairs departments issued contradictory statements about the case. Sur and food minister Nirmal Bose started an unseemly debate on whose was the ultimate responsibility and at one stage an attempt was even made to pass the buck to Buddhadeb Bhattacharya, the municipal affairs minister.

As far back as in 1972, about 400 people at Dum Dum, a northern suburb of Calcutta, had fallen sick after consuming adulterated mustard oil and had become physically crippled in course of time. During these 17 years, the victims have neither been fully rehabilitated nor given any adequate compensation. Though the present state government is not responsible for the incident, it is evident that it cared little to learn from the past. Distribution of the adulterated rapeseed oil started on June 24, 1988 and there were complaints since then about its ill-effects. But the local rationing authorities and the food department officials paid no heed. Why did not the government stop the supply of the adulterated oil? Was there a mustard oil lobby in action to sabotage the rationing system and create a fear psychosis? And why was the matter not probed right in time?

The urban agglomeration of Calcutta with a population of over 11 million provides ideal opportunities for food adulteration. The steady rise in the population is not matched by increase in the supply of food. As a result, almost every food item is being adulterated, quite often with dangerous substances. The state government has not had any definite policy to deal effectively with the offenders who are doing brisk business under the very noses of the health department officials and the police.

Even if there were no overcrowding in the city hospitals and no adulteration of food items and medicines, the very atmosphere of the city claims hundreds of lives. As the streets get increasingly chocked with the ever-growing number of vehicles and as industrial units, even those handling hazardous chemicals, keep sprouting all over, the atmosphere is getting increasingly clogged with every conceivable type of pollutant. The problem is aggravated by the heaps of uncleared garbage strewn everywhere. The government is now getting ready for the tercentenary celebrations of Calcutta on which it will spend lot of money through seminars, exhibitions, fetes and fairs. But all this will hardly ameliorate the conditions of the common people who will continue to be haunted by disease and death—as was poignantly brought out by the mass deaths of new-born babies in the Calcutta Medical College and Hospital.

KARNATAKA STATE FINANCIAL CORPORATION
25, M.G. Road, Bangalore-560 001

EXCERPTS FROM THE CHAIRMAN'S STATEMENT AT THE 30TH ANNUAL GENERAL MEETING HELD ON 25TH JULY 1989

Mr. M. Sankaranarayanan, IAS
Chairman

Ladies and Gentlemen,

Another year is over. It is now my privilege to welcome you to the 30th Annual General Meeting of the shareholders of the Corporation.

In my statement at the last general meeting I had indulged in purple prose and had almost become ecstatic in describing the growth of the Corporation and its achievements. I do not propose to do this again though there is ample justification to do so. Suffice it to mention that the momentum which the Corporation has acquired in the last few years has enabled it to grow further in many directions. It retains its pride of place among the term lending institutions and has diversified its operations even more. Its acknowledged primacy has made it the leader in many areas and one can say with pride that it continues to function upto our great expectations of it.

OPERATIONAL HIGHLIGHTS:

The Corporation has an impressive track record with a continuous and marked degree of improvement in its operations, year after year over the past six years. 1988-89 was another year of record performance in all its key operations viz., Sanctions, Disbursements, Recovery, Rehabilitation of Sick units and Assistance to Backward areas.

The overall performance of the Corporation against the targets set for 1988-89 is as follows:

(Amount: Rs. in crores)

Sl. No.	Particulars	Target	Achievements	% achievements	% growth over the previous year
1.	Sanctions	140.00	148.32*	105.94	18.09
2.	Disbursements	118.00	124.60	105.59	18.90
3.	Recovery	87.00	92.88	106.76	23.05

* Includes bridge loan of Rs. 3.66 crores

COMMENDATION BY THE GOVERNMENT:

The Government of Karnataka have conveyed their appreciation to the Corporation for exceeding all its targets. Government of India have also conveyed their appreciation that the Corporation has been one among the top ten companies which have returned the maximum income for the assessment year 1987-88.

REHABILITATION OF SICK UNITS:

During the year the Corporation extended a total Rehabilitation Assistance of Rs. 9.15 crores to 314 units under the scheme of IDBI, as against a total assistance of Rs. 7.90 crores to 174 sick units in the previous year.

FLOW OF ASSISTANCE:

1. ASSISTANCE TO BACKWARD AREAS:

During the year under report, the Corporation has sanctioned loans of Rs. 68.55 crores to 3,951 cases in backward districts as compared with Rs. 57.28 crores sanctioned to 2,823 cases during the previous year registering an increase of 40% in terms of number and 19.67% in terms of amount.

2. ASSISTANCE TO SMALL SCALE SECTOR:

During the year, 5,078 cases amounting to Rs. 106.72 crores were assisted in the small scale sector as against Rs. 94.93 crores to 4,232 cases during the previous year. This represents an increase of 12.4% in terms of amount and 20% in terms of number over the previous year.

3. ASSISTANCE TO SC/ST/BACKWARD CLASSES:

During the year under report, 1,366 entrepreneurs belonging to SC/ST/BC category availed an assistance of Rs. 10.63 crores as against 1,241 entrepreneurs assisted to the tune of Rs. 7.66 crores in the previous year, registering a growth of 39% in terms of amount.

4. WOMEN ENTREPRENEURS:

During the year under report 1,067 women entrepreneurs were assisted to the tune of Rs. 4.67 crores as against 527 women entrepreneurs availing assistance of Rs. 2.08 crores in the previous

year, resulting in an increase of 102.46% in terms of number and 125% in terms of amount.

5. DEVELOPMENT OF LOCAL ENTREPRENEURS:

During the year 6,155 local entrepreneurs were assisted to the tune of Rs. 138.87 crores. This represents 99.62% in terms of number and 96% in terms of amount of the total sanctions during the year.

HIGHLIGHTS OF THE YEAR 1988-89:

SINGLE WINDOW SCHEME:

The newly introduced Single Window Scheme in August 1988, came as a sigh of relief to the new entrepreneurs as this novel scheme provides both term loan and working capital assistance.

RURAL INDUSTRIALISATION PROGRAMME:

This scheme was introduced with an objective to motivate rural entrepreneurs to take up industries, taking advantage of the locally available resources such as raw materials, skills and market.

ASSISTANCE TO MINING ACTIVITY:

A special scheme was launched in the month of February '89 to extend assistance on liberal terms to those engaged in mining activity under licence from MMTC.

FINANCIAL PERFORMANCE:

During the year under review, the Corporation generated a gross revenue of Rs. 43.70 crores on cash basis as against Rs. 34.26 crores during 1987-88.

TARGETS FOR 1989-90:

The Corporation has set the following targets for the year 1989-90:

SANCTIONS	...	Rs. 168.00 crores
DISBURSEMENTS	...	Rs. 141.00 crores

SUGGESTIONS:

CREATION OF FUNDS AT SFCs TO SUPPORT R&D ACTIVITIES:

Research and Development activities need venture capital type of support, involving the loss of capital in the event of a failure of the development of a commercially viable technology, process or product. The Central Government or IDBI may consider creating a venture capital fund at the SFCs, to support R&D in the small scale sector.

GRANT TO SFCs FOR OFFERING FREE MANAGEMENT CONSULTANCY SERVICES TO SSIs:

The availability of management and technical consultancy services with little or no cost to the small entrepreneurs is important to build a healthy small scale industrial sector and to minimise the incidence of sickness and organisational deficiencies.

KSFC has been operating its own Free Management Consultancy Services Scheme since 1985, thanks to the initial support of the IDBI. There is however, a need to broaden the scope of this scheme. As this requires larger and continued financial support, the IDBI may consider sanctioning an annual grant to SFCs for arranging Free Management Consultancy Services to SSIs (including the ones graduating into MSIs)

A few suggestions made by me last year have not evoked favourable response from the IDBI. I am repeating them here.

(i) In view of the increase in the authorised share capital of the SFCs to Rs. 50 crores, the ceiling on guaranteed dividend so foregone by the State Government and IDBI should be proportionately enhanced to Rs. 12.50 crores to enable SFCs to strengthen their financial base more effectively for another 3-4 years.

(ii) As per the amended SFCs Act, there will be a five fold increase in the paid-up capital of many SFCs. Indubitably, the SFCs will find it difficult to meet the obligation of the guaranteed dividend on the enlarged capital which will progressively increase in accordance with the programme for conversion suggested by the IDBI. I would once again request IDBI to retain the outstanding amount of loan in lieu of capital, as loan portfolio only for another 15-20 years so that SFCs can have the advantage of paying interest as a charge on its profits before tax, in order to consolidate their financial position.

(iii) SFCs are functioning as Regional Development Banks. On the same principle on which the IDBI is granted exemption from Income tax, the SFCs should also be exempted from the liability of income tax by treating them also as development banks.

(iv) IDBI was covering the entire overdues including interest of the SFCs under the RSR Scheme when it was introduced in 1984. Subsequently, the interest overdues were made ineligible for refinance. I suggest that IDBI reconsider its policy in this regard and assist the SFCs to adopt a bolder and more pragmatic approach for rehabilitating sick units. Further, I would request IDBI to charge a lower rate of interest on such refinance so as to leave a clear margin of 3-4% to SFCs in order to absorb eventual losses arising from the rehabilitation of sick units.

ACKNOWLEDGEMENTS:

I wish to gratefully acknowledge the valuable assistance, co-operation and support received from the State Government especially the Departments of Finance and Industries and Commerce. My sincere appreciation and thanks also go to IDBI for its beneficial guidance and liberal refinance.

I wish to express my gratitude to institutions like KSIIDC, DIC, KSSIDC, TECSOK, LIC, KIADB, KEB, Scheduled and Commercial Banks and the entrepreneurs assisted by KSFC for their whole-hearted co-operation in our endeavours.

I deeply appreciate the unstinted co-operation received from voluntary organisations like FKCCI, AWAKE, KASSIA, Rotary and Lions Club in the Corporation's developmental activities.

I would like to place on record our appreciation of the invaluable services of Sri S.B. Muddappa, Sri M.S. Husain and Sri P.S. Ramachandran during their tenure as Directors.

Finally, let me take this opportunity to convey my sincere thanks and appreciate the very commendable efforts put in by the Managing Director Sri Y.K. Puttasome Gowda and by the other officers and the officials of the Corporation for the all round progress of the Corporation.

CONCLUSION:

It is not given to many to be at the head of a great organisation like the Karnataka State Financial Corporation. This has been my privilege and honour during the last six years. When, at the dawn of independence Pandit Jawaharlal Nehru called upon every Indian to be a partner in the adventure of building a new and progressive India, he must have had in mind, the creation and development of strong and public spirited institutions like our Corporation. We have humbly tried to reach those empyrean levels of achievement. We shall continue to endeavour towards those heights. Once again may I wish the Corporation even greater successes in its versatile and many splendoured operations

Thank you,

Bangalore
25th July 1989

M. SANKARANARAYANAN

Scuttling Wardha's Steel Plant

Ajit Kumar

The proposal to set up steel plants in Wardha district has pitted the Gandhian Ashramites against the local population. How tenable are the Ashramites' objections?

VIDARBHA, in Maharashtra is known, if at all, for its 'backwardness'. But among its nine districts, one district, viz, Wardha enjoys a special status in contemporary Indian history. Wardha's claim to fame can be traced to Gandhi's decision to stay there during the last phase of the independence movement and particularly after 1936 it became the unofficial capital of India with Bajajwadi, the estate of Jamnalal Bajaj becoming the meeting place of the Congress Working Committee. Nationalist leaders like Nehru, Bose, Azad, etc, used to camp at Bajajwadi frequently to meet Gandhi. Inevitably, in the post-independence period, Wardha lost much of its earlier importance till Vinoba Bhave launched the Bhoodan movement. Even this short-lived importance would have ebbed away had it not been for Indira Gandhi's impromptu visits to Paunar for Vinoba's 'darshan'. The tradition of visits was continued by the present prime minister but the venue shifted from Paunar to Sevagram (in the interregnum Vinoba Bhave had passed away).

Contemporary Indian politics have not been kind to Gandhiates in general and even less so to the Sevagram Gandhiates. The prime minister visited Sevagram on January 30, 1989 for distributing the Jamnalal Bajaj awards, but unfortunately, one of the awardees (Malati Devi Chowdhury of Orissa) refused to accept the award on the ground that the PM was not 'qualified' to give away awards for 'Gandhian' work. This immediately created a furore among the Ashramites with allegations and counter-allegations, with one section commenting on the propriety of inviting the PM and finally ended with the resignation of one of the trustees.

In spite of these troubles, the visits from the highest of the land have paid some dividends to the district in the form of increased official attention. The Planning Commission, on the recommendations of a sub-group, finalised a 'Gandhian' plan for Wardha in 1983. In July 1985, the chief minister of Maharashtra, Shivaji Rao Nilangekar, made the official announcement that Wardha is to be developed into an ideal Gandhian district. While he did not spell out how this was to be done, Rs 150 crore were earmarked for this purpose and industrialisation was to be speeded up. Fortunately for Gandhi's dreams not much action has been taken on the former CM's pronouncements.

The ebb and flow of Wardha's destiny took a better turn with the election of Vasant Sathe from the Wardha Lok Sabha constituency, who in spite of the conventional flaws of the Congress politician, gave considerable thrust to the district's industrialisation. This, no doubt, was actuated by the fact that in the previous election he narrowly escaped defeat at the hands of the CPI(M) contestant. Aided by his aggressive PR approach and proximity to the PM a number of entrepreneurs were persuaded to invest in Wardha. The first one to be enticed was a NRI subsidiary of an American corporation to set up a technology park for producing computers, communication equipment, software, etc, with the bulk of it marked for export. To that extent it appears to be no different from the Export Promotion Zones already in existence and hardly conducive to the fulfilment of Gandhian dreams. More importantly there was no murmur of protest from the Ashramites at this defilement of Gandhi's dreams.

But Sathe's second initiative has stirred up a hornet's nest in Wardha. While the actual potential of these industries to create employment and infrastructure can be debated, the controversies created is a revealing testimony on the concerns and perceptions of the Sevagram Gandhiates *vis a vis* the common problems afflicting the local citizens.

A non-resident Indian S A Agarwal of Steelworks Inc, in Chicago was to set up a Rs 200 crore company called Inland Steels and a UK based NRI, N G Kabra was to set up a Rs 180 crore company, Integrated Steel Plant. The former was to set up at Bhugaon-Selukjhet village 12 km from Sevagram and the second plant was to come up in the Wardha MIDC which is also close by. The plants would provide direct employment to 2,500 people and indirect employment to a large number apart from creating an infrastructure of roads, transport, ancillary industries, etc.

Vasant Sathe has directed his ire at Sushila Nayyar, a noted Gandhian, former union health minister and a member of the committee of the Sevagram Medical College for instigating Nirmalaben Gandhi (daughter-in-law of Mahatma Gandhi) to present to the PM objections against this proposal. On this basis the PM ordered a temporary stoppage of work. This was followed by the union minister for steel and mines, Fotedar's statement in the Rajya Sabha the other day that the proposed steel plants cannot be established in Wardha. In a letter dated February 21, 1981, the additional secretary,

environment informed P Subramaniam, secretary, department of energy, government of Maharashtra that clearance was not being given to Integrated Steels and Indian Steel because of the environmental threat posed to Bapu Kutir. The letter, rubbing salt in the wound also added, that the state government should shift the existing industries in the MIDC further away from the existing location.

Ashramites' Objections

The Ashramites have raised primarily two objections. Firstly the proposed plants will pollute the environment around Bapu Kutir and secondly the peace of the Ashram will be destroyed. Apparently this is not the first campaign launched by the Ashramites. Nearly 15 years ago a steel fish plant had to be shifted to Visakhapatnam under similar circumstances. Similar was the case with a spinning and weaving mill and the Golden Tobacco and Forges Company's projects.

Do the Ashramites have a case? As per their statement they are not opposed to the steel plants *per se* but to its proximity to Bapu Kutir and the concomitant pollution. The Vidarbha Industries Association (VIA) has brought to light in a press conference that according to a government survey the wind flow is from the west to the east and so the pollution will not a effect Bapu Kutir. More important is the fact that the Maharashtra Pollution Control Board had cleared the project in 1985.

The obvious solution would be to relocate the project. Since the present location was selected with specific economic consideration a private entrepreneur may not be willing to change the site. The VIA has pointed out that the present site has been selected because it is close to the MSEB sub-station and the Wardha east railway station. Apart from that the necessary formalities with the irrigation department and the MIDC authorities for supply of water has been cleared. There is now a possibility of the proposal falling through.

Today in Wardha the Merchants' Association has taken a lead in this matter. The Maharashtra Pradesh Youth Congress(I) president Promod Hiwale has threatened to launch an indefinite hunger strike in front of the PM's residence in Delhi if the government does not revoke its earlier decision. The Congress(I), CPI, CPI(M), Shiv Sena and the Maratha Mahasangh organised a bandh followed by a public meeting. The veteran CPI leader A B Bardhan has taken a lead in constituting a 'Wardha Steel Plant Location Action Committee' comprising members from different social groups including VIA in Nagpur.

It is pertinent here to comment on the influence of Gandhian thought in the pre- and post-independence Indian society. During the independence movement Gandhi and his followers played a very influential if not a dominant role. But in the post-independence evolution of Indian polity there has been a complete marginalisation of Gandhian thought. This essentially is a reflection of the success of the Indian state in co-opting the Gandhiates and at various levels of economic, social and political interaction the Gandhiates have extensively collaborated with the old Congress Party and the present ruling party. The last 42 years have seen the complete alienation of Gandhian thought and of his followers from the local society which is a tragedy considering Gandhi's, almost 'magical' understanding of the Indian psyche.

It speaks for the distance the Sevagram Gandhiates have travelled away from the people, that their concern is limited to pollution over Sevagram and not about the residents of the new site if and when the plant is relocated. What do the Ashramites hope to achieve? The preservation of Bapu Kutir as a historically sanctified place of pilgrimage and of tourist interest both for the ordinary Indian and our 'rulers'. That Wardha because of the Gandhian institutions occupies a place in the tourist map is attested by the fact 50,000 people including foreigners visit Sevagram every year. The commercialisation of Gandhian thought has got an impetus with the setting up of various departments of Gandhian thought imparting degrees and diplomas with Sevagram as a landmark in the academic itinerary. The Ashram Gandhiates would do well to ponder on the findings of a government survey which indicated that while in 1901, 45 per cent of the population in Wardha was engaged in non-farm occupation, the number had dwindled to 10 per cent in 1946 and 2 per cent in 1968.

The Gandhiates could have restored a modicum of respectability to Gandhi and his ideas by utilising his views on industrialisation and foreign technology as a plank for attacking Vasant Sathe's NRI-based development instead of harping on pollution. Considering the large investment, the officially-stated figure for employment generated is for a mere 2,500 people which is not going to make any dent on the unemployment situation in Wardha. Moreover considering the nature of technology to be used the local youth or worker is not going to benefit very much. As an alternative they could have pressurised the state and central governments and Vasant Sathe to implement the official Gandhian plan particularly its rural industries component which on paper is employment-intensive. The Ashram Gandhiates by merely paying lip service to Gandhi's greatness and conveniently forgetting or ignoring his thought qualify for Sathe's pejorative for them—'phoney Gandhians'.

MADHYA PRADESH

Press under Pressure

Approval of the state government and the chief minister personally has become a vital consideration in the posting of correspondents of the national newspapers in the Madhya Pradesh capital.

THE public relations outfit of the Madhya Pradesh government is scaling new heights. Till now they could manage only the provincial press, dependent to a large extent on state government advertisements for its existence. But now even the national dailies seem to have started caring for the chief minister's wishes.

The proprietor-editors of most of the regional newspapers, with a few honourable exceptions, have always believed in crawling when asked to bend. They zealously support each successive chief minister. Recalls a local journalist: "Working under these constraints we always looked up to the correspondents of national dailies for taking on the government."

Not any longer. With every change in the political regime in the state, the correspondents of the national dailies are changed or transferred. It is certainly not a coincidence that only those correspondents are shifted who are not on good terms with the new incumbents.

The latest in the series is the transfer of the Bhopal correspondent of *Navbharat Times*, the Hindi daily of the *Times of India* group. He was alleged to have been too close to former chief minister Arjun Singh. Last month he was transferred to Chandigarh in peculiar circumstances. He was asked to move even as his successor, the man in Chandigarh, refused to vacate the post and obtained a court stay against the transfer.

The newspaper's editor denies that it was a politically-motivated transfer. The management explains that it was a routine transfer. And the state government, of course, claims that it is not involved. But the fact remains that the management had in the past indicated to the correspondent who is being transferred that chief

minister Motilal Vora was not very happy with him and that he should mend his ways.

The *Times of India* group is planning to launch new editions from Bhopal. It has already acquired land from the government for the purpose. The company is also putting up a Rs 108 crore acrylic staple fibre unit in Madhya Pradesh. Obviously it needs a lot of goodwill in the corridors of power.

Transfers of newspaper correspondents indeed seem to follow a set pattern. The *Times of India's* Bhopal correspondent had been transferred last year soon after Arjun Singh came to power. The man was thought to be too close to Vora for Singh's liking.

The Hindustan Times correspondent in Bhopal had been transferred in humiliating circumstances two years ago. He was first sent to Hyderabad but there found that his predecessor was still functioning. He was brought back to Bhopal and asked to go on leave. After months of waiting he was given a posting in Jaipur. All this because he had reportedly invited the wrath of a union minister from Madhya Pradesh. The correspondent of the group's Hindi newspaper, *Hindustan*, was also shifted from Bhopal to please the same minister. The present correspondent of *The Hindustan Times* is thought to be not very favourably disposed to Vora. Recently he was conveyed a subtle message by the public relations outfit of the state government that Vora had had an hour-long meeting with the newspaper empire's heiress.

Chief ministers getting annoyed with correspondents who write the unpalatable truth and trying to get them transferred from their states is not new. What is new, and frightening, is that newspaper managements are now more than willing to listen.

Newcomers Below the Poverty Line

Bharat Dogra

Claims are advanced on behalf of the government about the number of people lifted above the poverty line in every five-year plan. But what about the number of those who, above the poverty line to begin with, are pushed below it by a variety of forces, all endemic to the operation of the economic system, such as the destruction of traditional crafts and industries, large-scale displacement on account of development and defence projects, floods and droughts and sickness and closures in organised industry?

POVERTY reduction is claimed to be an important part of development planning in India. A major aspect of every five-year plan is the extent of poverty reduction achieved or, to use the official jargon, the number or percentage of people who have been raised above the poverty line. The claims made in this regard are widely discussed and debated, testifying to the political and socio-economic significance attached to this issue.

Various Planning Commission documents describe what proportion of persons below the poverty line have been raised above the poverty line, and how. To some extent this is supposed to be achieved by the overall economic growth and to some extent by the specific poverty alleviation programmes such as the IRDP, the various employment works, etc. However, this entire exercise ignores one extremely important dimension. It does not consider the number of newcomers below the poverty line, i e, the number of people who have been pushed below the poverty line during the period under consideration. This number has to be subtracted from the number of people who have been raised above the poverty line due to the impact of poverty alleviation programmes and other steps. Only then can we have a proper estimate of the extent of poverty reduction.

It is not difficult to identify the complex of factors due to which more and more people, who were once earning their livelihood in a relatively satisfactory way, are being pushed below the poverty line. Newspapers in recent years have given many instances of projects involving large-scale displacement without proper provisions to ensure satisfactory rehabilitation. These include dam projects, mining projects and several other development and defence projects. A large majority of these people are likely to have suffered a significant deterioration in their income and living standards.

Secondly, there are a large number of artisans who have been fully or partially displaced from their occupations. This may happen because of competition from machines against the government's declared policy of protecting them—for example, the competition handloom weavers face from powerloom weavers or handprinters face from mechanised printing. This may happen also due to the denial to them of the basic raw materials. For example, bamboo artisans in many parts of the country have been increasingly deprived of their basic raw material in recent years because of the destruction of bamboo forests as well as the neglect of their needs by officials. Thirdly, there are artisans who suffer because of the vagaries and uncertainties of the market, specially the export market. Lastly, there are a substantial number of small and poor artisans who suffer just because of the criminal neglect and corruption of officials.

Fishermen and miners are two other groups who have lost employment and livelihood on a large-scale in recent years due to mechanisation and related technological change. The same can be said of some categories of industrial workers. Prolonged lock-outs have taken their toll in the form of workers rendered unemployed. The number of sick and closed industries has increased greatly in several parts of the country, forcing workers into long periods of unemployment and uncertainty.

A large number of other people do not face sudden unemployment or loss of livelihood; for them the loss is somewhat gradual but it is very real and painful. For example, a large number of peasants whose yield is steadily going down and livelihood becoming precarious (specially in the hilly areas) due to deforestation, soil-erosion, landslides and related problems. The combined impact of these problems over the years may force entire families to leave their traditional homes and employment and go out in search of an uncertain future.

The growing damage from manmade disasters such as droughts and floods, landslides, gas leaks, severe pollution, communal violence, etc, leaves permanent scars on the lives and livelihood of a large number of people, making it difficult for them to make both ends meet.

The list can no doubt be extended, but the main point has been made. Even if we consider only these categories, the number of the severely affected people in recent years runs into not lakhs but crores. So to know the real magnitude of poverty, it is necessary that estimates of these people pushed below the poverty line during a plan period are also made and the estimates of people raised above the poverty line are then adjusted by subtracting this number. And if in the process we reach a negative figure, we should not be shy of admitting that fact.

An honest exercise of this nature will make us conscious of the distress of the most needy sections of our society and such a realisation will be the first step towards concerted action for their upliftment. On the other hand, by neglecting such an exercise, we merely perpetuate and aggravate the neglect of these sections.

Urban Housing

Sreemay Basu

To make possible the huge increase in housing stock needed to meet the requirements of shelter, there will have to be a radical rethinking of all aspects of the legislative, financial and technological practices that today regulate the construction of buildings in different parts of the country.

THE 'International Year of Shelter for the Homeless', 1987, generated a fair amount of activity, including seminars organised at the state as well as at the national and international (like those at Trivandrum and New Delhi) levels. Academics, bureaucrats and legislators generally concerned themselves with the vast aggregative dimensions of the housing problem. An aspect somewhat overlooked was the qualitative changes occurring in the process of delivery of housing to consumers in urban areas. This is also of immense significance. The housing scene in Calcutta where this change has been occurring over the last decade may serve as an example, typical of urban centres across India.

Housing for the middle class nowadays ranges between Rs 300 and Rs 400 per sq ft. In this range flats are available at Salt Lake, Behala, Jadavpur and similar outlying areas. The cost of construction for the developers, who are organised and able to obtain materials and labour at better rates than individuals, is roughly in the range of Rs 120 to Rs 150. Therefore, the remaining Rs 180 to Rs 250 represents the cost of land and the developers' profit. How much of this is the cost of land? For our rough and ready calculations, let us take Rs 1,00,000 per cottah, which is 720 sq ft. If we assume an average permissible floor area ratio of 1.75, this cost translates to Rs 80 per sq ft. The developers' profit is therefore between Rs 100 and Rs 170 per sq ft, or 33 to 40 per cent of the total expenditure. Since in most cases the prospective owners have to make the payments in advance, according to the stages of completion, there is no cost of capital involved and little difference between 'gross' and 'net' rates of returns. The rate of return is higher in the case of luxury housing, costing Rs 750 per sq ft and above, in areas like Alipore, Southern Avenue, Jodhpur Park and Ballygunge and even higher in the case of commercial property development.

The most fundamental change that such high returns have brought about is that building construction has become a commercial enterprise. It is no longer in the hands of professionals. Thus we find the agencies entrusted with the powers to regulate and oversee construction corrupted to such an extent that obtaining necessary sanctions now ranks as *the* most important step in the construction process. This has also resulted in spectacular abuses of building bye-laws, as in the Alipore high rise case. In general, because immediate return is the prime objective of such enterprise, the net result is diminishing standards of both construction and design. Other manifestations of this change ('For a Roof over the Head', *The Statesman*, 30.12.1987) are the use of 'power of attorney' and other extra legal methods of property transfer, the ouster of the middle class from their ancestral homes, eviction of slum dwellers and the moving in of lower middle class to slum accommodations (a phenomenon noted particularly in Bombay). This state of affairs offers scant hope of addressing the shelter needs of tomorrow even for middle and low income groups. The prospects for the poor, known euphemistically as 'Economically Weaker Section', are no brighter. Their fate rests solely on government agencies whose inefficiency renders housing schemes for this section of society—inherently in need of large subsidies—even less viable economically.

As we go towards the 21st century, the aggregate needs for shelter in only the urban and semi-urban settlements of our country are being estimated in the range of an additional 50 million houses or flats. To make possible this huge increase in housing stock, there will have to be a radical rethinking of all aspects of the legislative, financial and technological practices that regulate the building of buildings in different parts of India today.

There is need for an integrated and innovative shelter programme. There are signs that the government is slowly starting to wake up to the dimensions of the problem. The National Housing Bank has just become a legislative reality. It is to be an apex body, linked with regional institutions like the HDFC in the west and the HPFC in the east. The need for such public and joint sector undertakings is not only to promote finance, but to embark on actual cost effective construction, so that the objective of maximising short-term returns can be replaced by that of providing affordable housing to all the different sections of society.

The shortage of land will obviously exist and get accentuated. Again, the government has to embark on comprehensive planning exercises integrating the different types of land uses in metropolitan, urban and semi-urban settlements. These should be based on computer-aided modelling and analysis for forecasting and for evaluation so that all plans are as accurate and as specific as possible, and allocation of scarce resources can be made optimally. Delicate balances have to be maintained. The wholesale conversion of agricultural land for building purposes cannot continue. Hard choices regarding ownership of land and the limitation of space for habitation have to be made.

An important related issue is that of density of development. Fallacies persist in planners' minds about 'high rise' and 'high density'. The Land Use and Built Form Studies Group at Cambridge have proved mathematically that high densities do not require high rise. In fact they have shown how Manhattan could be rebuilt at existing densities in buildings less than eight storeys high without loss of open spaces and parks. What is required is consolidation of land holdings. Though this may be difficult to achieve presently in already built areas, at least in the new developments planners have to adopt such innovative approaches.

The issue of integration has been mentioned in passing. A case in point is Kalyani. Despite massive outlays in local infrastructure development, the township remains unpopulated because the necessary transportation links to Calcutta have not been developed. Yet, paradoxically, even at Kalyani the property transfer procedures remain so cumbersome that individuals wishing to now buy and settle there feel discouraged. Such procedures will have to be streamlined.

Finally, there is the question of design and of construction technology. There is scope for effecting great economies with organisation and use of new materials and innovative techniques. Today in Kerala Laurie Baker builds successfully with traditional materials for under Rs 100 per sq ft. There is no reason why we cannot also lower our costs substantially.

Construction management has now become a field in its own right. With the use of computers to maintain and monitor schedules and optimise construction procedures, much of the waste and uncertainties of traditional methods can be eliminated. This results in shorter execution times and the reduction of ancillary costs associated with delays.

On the materials side, there has been a worldwide revival of interest in traditional materials like mud for modern urban applications and also in age-old techniques of constructions utilising these traditional materials. Hassan Fathy in Egypt uses mud not only to build the walls but also the roof of his buildings in the ancient

Nubian technique of vaulted construction. These need no other supports—not even during the construction procedure. I have had the opportunity to try this technique in experimental buildings at Sidhi in MP in 1983 and again in 1987 as a students project in my university, the School of Planning and Architecture in Delhi. Nader Khalili of Iran extends Fathy's technique by firing these buildings from inside to obtain pucca buildings. He has shown how this can be cheaper than building with kiln fired bricks. In India Ray Meeker has tried this method in several buildings at Pondicherry. And historic examples include the terracota construction of Bankura and Bishnupur in Bengal.

The French CRA-Terre Group affiliated with the University of Grenoble uses 4 per cent cement to stabilise such mud brick buildings. They have had extensive experience in North Africa. Other stabilising techniques which are less permanent and need renewal every 2-3 years have been developed by CBRI at Roorkee. These may be suitable for semi-urban applications and can bring building costs down to the range of Rs 20 to Rs 25 per sq ft.

Applications of such techniques are not confined to lower income housing. Housing for millionaires in Nevada and for the Mediterranean rich have been built in mud. There are building magazines devoted exclusively to mud construction and special building codes devised for the purpose in America. Isn't it ironic that the world's richest country devotes so much attention to such humble materials while we, who are in dire need of alternative materials and techniques to meet housing shortages of gigantic proportions, continue to turn our back on materials that have been part of our tradition for millennia?

Pakistan: Dilemma of the Left

Babar Ali

The main agenda for the left should be one of left unity. Despite the historical catastrophes—mainly due to petty and subjective factors—whatever remains of the left should organise itself as the third alternative.

PAKISTAN is tending towards a two-party state at the federal level, with numerous nationalist groups existing at the provincial level. Given the predominance of the Pakistan People's Party and the Islami Jamhoori Ittehad, the two main contenders for power, other smaller groups and parties must toe the line of one of these two. One result of this alignment has been the creation of the Combined Opposition Parties, which is a group of seven parliamentary parties with the IJI at the centre, rallying against the People's Party government. The only party of any significance which has not joined either of the two is the Karachi based Mohajir Qaumi Movement, which could decide the balance in the future political game in Pakistan. In this political scene, the left has absolutely no choice but to support the People's Party rather than the more reactionary IJI.

The track record of the left, in the last couple of decades in Pakistan, has been so poor, that it is indeed a miracle that there is a left in the country. History has condemned the left to play a very insignificant role in Pakistan's politics today. At best it must confine itself to supporting (and that too verbally) one or the other of the political parties vying for power. Complete intellectual and ideological bankruptcy, dogmatism and Stalinist sectarianism, imported political programmes and strategies and foolhardy analyses and formulae, by the leadership of what claims to be the left in this country, has resulted in a situation which can in no way be justified. There is no such phenomenon as a left 'force' in Pakistan, and a mere handful of petty-bourgeois intellectuals, all of whom claim to be in the central committee of one of the many Communist Parties, is the identification of the Pakistani left and of the revolutionary movement in this country. In such a situation all that they can do is support the People's Party.

The argument given is that failure to 'support' the People's Party amounts to supporting the reactionary, pro-imperialist, fundamentalist Islami Jamhoori Ittehad which is regarded as a legacy of the martial law regime of general Zia. The People's Party is seen to be the lesser of the two evils and representative of the liberal bourgeois order and thus needs to be 'supported'. At one level of analysis, the left identifies the democratic process and the People's Party government as a brainchild of the US imperialism, where civilian regimes are seen to be more suitable to fulfil the grand designs of imperialist strategy as opposed to the more naked military dictatorships. This analysis understands that since democracy is the preferable option for the US in the present historical epoch, the likes of Cory Aquino and Benazir Bhutto need to be supported by the interests that serve the United States, i e, the US business, the World Bank, IMF, etc. Thus the high profile of the glamorous visit of Benazir to the US and the promise of more arms and more 'aid'. This analysis concludes that despite being pro-imperialist, the anti-imperialist left should support Benazir Bhutto, and democracy, rather than stay neutral or take an anti-Benazir approach, which the left feels will be playing into the more reactionary IJI camp.

So, at one level of analysis, the People's Party is seen as pro-US. At another level, the left cites numerous positive steps taken by the government, prominent amongst them are the freeing of political prisoners and a freer media. Other positive steps include a better approach to the Afghanistan 'problem', i e, seeking a political solution rather than take recourse to a military fanatical holy war. (For the left, a stance on the Afghan question is a barometer which indicates the degree of leftism.) The left also approves of the government policy towards India and considers this another positive measure undertaken. The restoration of bourgeois civil and human liberties is another major step of the government, particularly the lifting of the ban on trade unions and student unions. I really cannot count many more 'positive' steps.

It is indeed unfortunate that the left is condemned to support the People's Party on the basis of a few meagre and measly 'positive' measures. There have been no basic structural steps regarding the economy and corruption is as rampant as ever, with the *goondaism* of the Zia coterie being replaced by the corruption and *goondaism* of the People's representatives. Yet we are told that if we do not 'support' the People's Party, we will be playing into the hands of the reactionary fundamentalists.

I strongly disagree with this approach of the left and feel that it has implications which do not augur well for an already humiliated and almost non-existent left, and which do not favour a possible future where the left can begin to grow. The first point is that the left should realise that given its strength and support in the masses, its 'support' of the People's Party is a waste of time and inconsequential. What difference does it make to the people whether one of the Communist Parties, with its membership of two dozen, supports any government or not? The time and energy consumed in writing statements in defence of a right-liberal regime could be used in more productive ways. Pakistan has been given the opportunity of exercising a few bourgeois freedoms and the left should begin organising itself as the third alternative rather than try to cement a regime which, given half a chance, when the need arises, will squash whatever left there is. The left should begin to build its base in the trade unions and amongst the different working sections of the country. The 'support' for

the present government, given its (the left's) strength is inconsequential. Furthermore, when the left acknowledges the fact that the main reason why the People's Party is in power is due to the patronage of the US, 'support' or otherwise from the left is immaterial. This is the best time to build its own base.

The main agenda for the left should be one of left-unity, despite the historical catastrophes—mainly due to petty and subjective factors—whatever remains of the left should organise itself as the third alternative. This is easier said than done considering the track record, which has been so poor, that it would indeed be a substantial achievement if the left did get its act together. In this regard, the newly formed Qaumi Inqilabi Party (which was originally the main section of the Communist Party, also known as the 'minority' group) has taken bold measures in contacting other smaller parties of the left and has given a call for unity. The call has been well received by the other left groups. ı lthough issues are still to be discussed in detail, there is consensus on a few broad issues: a party of the working class and working masses needs to be formed with its own independent programme and its own independent functioning (unlike the past, where the Communist Party of Pakistan always worked within other parties); the name of the Communist Party should be changed if the party is to engage in open mass politics, as this name is inappropriate in the context of a backward Islamic country like Pakistan; the new party to be launched should include, if possible, all Marxist groups and the left should emerge as a united force if they are to play any role in this country.

This move based on these broad points initiated by the Qaumi Inqilabi Party is indeed welcome. One hopes that the QIP does indeed attract the smaller fraternal parties and being the biggest, most organised, and best equipped party does not suffer from chauvinism and has a revolutionary rather than a sectarian attitude towards unity. Only then can one hope for a future of the left in this country.

The problems and constraints towards unity are numerous and entrenched in history and difficult to overcome. But they have to be confronted. The biggest hindrance towards revolutionary strategy in this country is petty-bourgeois thought which passes for revolutionary Marxism-Leninism. If this thought prevails and dominates in the newly proposed left party, all attempts of unity directed towards a revolutionary alternative will fail. Given the constraints of Pakistani intellectuals and of the left movement, this becomes the most difficult, but important factor which may determine the future of the left in this country.

What is 'Socialist Freedom'?

K Balagopal

It makes little sense to use the expression socialist freedom in the same way as one uses the expression bourgeois freedom. There is nothing specifically 'socialist' about the freedom sought by the Chinese students nor about those promised by perestroika and glasnost. If by 'socialist freedom' is meant the right to build a socialist society or the freedom required for building such a society, then one can legitimately ask whether it is this freedom that Lech Walesa or the Chinese students want or Gorbachev desires to institutionalise.

THERE are two reasons for welcoming Manoranjan Mohanty's detailed statement of his position (June 17) on the recent Chinese developments; one, that it lifts the discussion to a meaningful level from the cynical asides and snide remarks that have constituted most of the comments even if left circles; and two, that those who read with a distinct sense of disbelief his brief piece in *Frontier* (June 25) are now assured that it is a seriously held viewpoint. There are, equally, two reasons for hesitating to react to his analysis; one, that very few of us can match Mohanty in his knowledge of Chinese politics; and two, that the spirit behind this reaction can easily be condemned as belonging to that genre of Marxism that 'will never learn anything'. And yet, when the gap in the understanding of persons all of whom equally profess to be Marxists has grown so wide, it is necessary that somebody puts aside all hesitation.

Let us pose the issue in the form of a few questions: (i) Is the contradiction between the state and the people central to the problems of socialism? And is it right to understand the major issues in the history of the socialist revolutions—Stalinism, the Chinese cultural revolution, Solidarity, perestroika and now Tiananmen Square—in terms of this contradiction? (ii) Granted that the Chinese students are fighting for some kind of freedom within Deng's political system, is that the same thing as fighting for 'socialist freedom'? More generally, do the phenomena such as Solidarity in Poland and perestroika in the Soviet Union represent an aspiration for 'socialist freedom', or do they, on the contrary, signify certain natural consequences of the abdication of the socialist ideal? (iii) Is it not a species of double make-believe to first of all accept the celebration of the market and material incentives, consumption and modernisation, as all part of 'socialism' anyway, and then hail the political and administrative reforms that are either demanded or necessitated as a consequence as a new wind of 'socialist freedom'? (iv) What is 'socialist freedom'? Indeed, what is socialism, and what does freedom mean in the context of socialism? Is socialism merely a system that provides a "greater possibility of the elimination of multilateral domination", and that too for the reason that it is led "by an organisation committed to the cause of the oppressed classes"? What happens if this organisation starts believing—or professes to believe—that socialism can equally be achieved by capitalist instruments?

There can be no two opinions about condemning the June 4 massacre. Killing of unarmed people would be condemnable even if they were counter-revolutionaries, but as it is, Deng being the biggest counter-revolutionary in China, it is ridiculous to call his opponents by the same name. Mohanty will perhaps disagree with this, but we are at least agreed on condemning the massacre. But this agreement makes no material difference to the questions raised above.

There is no point in seeking solutions to the problems of Marxist practice outside the framework of Marxism. Marxism has always viewed socialism as a transitory phase, a historical interregnum, that will work towards the goal of communism, in which all forms of oppression, inequality, bondage and alienation will come to an end. Even if we interpret this seemingly teleological notion as an ideal, a vision that we strive for, the meaning of socialism as a *continuously revolutionising phase of history* is not altered. Indeed, there is no teleology here for the millennium does not come at the end but is built in the course of the interregnum. And it has always been held by Marxists that this transition cannot be effected by the *spontaneous working of any formal structure*, an impossibility that is not remedied by attaching the label 'socialist' to the structure, but only through the leadership and guidance of the revolutionary proletariat.

It is necessary to emphasise the very real difference between this and the liberal political understanding, for it is here that the real problem of democratic rights in a socialist society lies. The idea of a conscious and organised revolutionising process as the vehicle of change is essentially antithetical to the bourgeois notion that change is effected through the working of institutions that reproduce themselves through the actions of free individuals. The 'invisible hand' of an equilibrating rationality is as central to bourgeois political thinking as it is to bourgeois economic theory. The bourgeois notion of freedom is situated in this understanding of history, and its claim to rationality—as distinct from its commendation on moral grounds—stems from this understanding.

This point, to repeat, is central to the concern of rights in a socialist society, and for this reason it appears to make little sense to use the expression socialist freedom in the same way that one uses the expression bourgeois freedom. There is nothing specifically 'socialist' about the freedoms sought by the Chinese students, nor about those promised by perestroika and glasnost. The freedom of association, freedom of conscience, freedom of expression and the freedom of assembly are all good old bourgeois freedoms, and so for that matter is the people's right to have a say in how they are governed. The last of these rights was first guaranteed in the Magna Carta ("scutage or aid shall be levied in our kingdom only by the common counsel of our kingdom" says chapter 12 of the Charter) and the rest of them recur again and again in the history of the English, American and French revolutions. If citizens of the socialist world are further driven by their existence to claim protection against forcible self-incrimination, double jeopardy and arbitrary detention and exile, then those rights do not for that reason become some superior thing called 'socialist freedom', for it was for these guarantees that the English Lords and later the Commoners fought their kings from John to James II, literally ages ago.

On the other hand, if by 'socialist freedom' Mohanty means the right to build a socialist society or the freedoms required for building such a society, then quite apart from the fact that this freedom is quite a different thing from what we mean by freedom in bourgeois society, one can legitimately ask whether it is this freedom that Lech Walesa or the Chinese students want, and whether it is such freedom that Gorbachev desires to institutionalise. Is that true? Do these 'new winds' blowing across the socialist countries seek freedom to do away with in-

equality, oppression and multi-lateral domination? Is this "the message of the contemporary upsurge in the socialist countries"? That seems a tall order. The question is not whether they desire an end to these inequities—most people do, at least when you interview them for a public audience. The question is, when these people use the expression freedom—or its institutionalised equivalent, democracy—are they seeking the freedom and the appropriate structures that will enable the people of those countries to put an end to inequality, oppression, and domination, i e, to build communism? One only has to pose the question this way to realise that the answer is in the negative. They are demanding rights the same way that people in western countries demanded them a few centuries ago. It is not correct to say that one should not describe as bourgeois every effort to win more rights in a socialist country. If it is bourgeois rights that are sought then it is bourgeois that one should call them, and the correct point that one must then make is that everything that is bourgeois in its origin need not be condemned. It can be legitimately held, for instance, that the provision of a writ of habeas corpus is a must in any civilised country, but it nevertheless will remain a right won for civilisation by the bourgeoisie, and will not get transmuted into a socialist right by the mere fact of a Wang Dan or a Xiong Yan demanding it.

But let us pursue further the notion of socialist freedom. The right to build an egalitarian society is perhaps the one absolute right in a socialist society (though how it would translate into the kind of prescriptive and justiciable rights that alone are allowed the title 'rights' by bourgeois jurisprudence is a moot point), but what exactly are the freedoms that are essential for the effective enjoyment of this right, that are part of the "economic, political and cultural conditions of liberation", in Mohanty's words? For instance, is it the freedom *of* religion or the freedom *from* religion that constitutes a condition of liberation? And what happens when there is a conflict between the two? Or—thinking of, say, Salman Rushdie— is it the freedom to pursue the whims of one's splintered and philistine consciousness that is a condition of liberation, or the freedom *from* the splintering and alienation of consciousness? And again, what happens when there is a conflict between these two freedoms? Or—touching upon a much-maligned aspect of the cultural revolution—do we demand the freedom to pursue unhampered one's profession of being a seeker of scientific truth, or do we desire freedom *from* the professionalisation of science? And this time we know what happens when there is a conflict between the two; Deng and the

Chinese student leaders—in agreement on this one point—have been telling us what happens. Indeed, they *are* partly what happens.

Freedom as understood in the socialist sense is much more often 'freedom from' than 'freedom of', which is not the same thing as saying that socialism is inimical to civil liberties. What it does say is that the socialist concept of freedom demands that we look at the question of civil liberties in a socialist society in its own terms and not in liberal terms. And it is essentially a liberal framework that Mohanty employs when he looks at the major issues of the history of the socialist revolutions, from Stalinism to Tiananmen Square, in terms of the contradiction between the state and the people, in terms of democratisation and socialist democracy. It must be emphasised once again that there is no point in seeking solutions to the problems of Marxist practice outside the framework of Marxism. It is slightly irritating to hear otherwise intelligent people say that a repressive state apparatus may be required for a few years after the revolution, until all the enemies are vanquished, but what is its need after so many decades. If the enemies consisted only of a handful of imperialist agents and big landlords, then no repressive state apparatus would be required even for a few years. But there is a class enemy inside each one of us, and the real problem is how to drive that person out without doing too much damage to ourselves. This latter proviso is not a concession to the self-appointed ombudsman called the west but a real part of the problem, for the 'freedoms from' that Marxism seeks include the freedom from torture, forcible confessions, enforced conversion of faith, etc, which were all rights won by the bourgeoisie from feudal rule. Marxism regards the freedom from an unequal, alienated, oppressive and dehumanised existence as primary, but it does not hold other rights in contempt. Nevertheless, there is a very real problem involved here, and it is unlikely that the proceses of revolutionary transformation that constitutes the historical task of socialism will ever be a very pleasant one. It is evidently no longer very fashionable to say that the revolution is not a dinner party, but nevertheless it is *not* a dinner party.

From this perspective, the cultural revolution, whatever else may have been wrong about it, was not wrong because it was a "centrally initiated campaign" nor because it was "launched by one section of the CPC leadership which was engaged in a bitter political struggle with others". Revolutions, as Mohanty does not need to be told, are never conducted exclusively from above or exclusively from below. And a core concern of a revolution is institutionalised power. If the recent history of the socialist countries has any message it is that this struggle for power does not come to an end with the declaration of a workers' state. In the continuous struggle to end all inequality and oppression, forces of resistance, forces of counter-revolution, rear their heads again and again, and the struggle against them quickly turns into a struggle in the arena of power, the arena of politics. This is a much more appropriate understanding of the cultural revolution than Mohanty's reading of it as one attempt to resolve the contradiction between the state and the people. What is the material basis of the forces of counter-revolution remains an unanswered question, despite the vigorous debate that followed the death of Mao and the denunciation first of the Gang of Four, then of the cultural revolution and then of Mao himself, but that such forces exist within revolutionising societies, that *they* do not suffer from illusions about institutionalised power, is revealed in the fact that in all the socialist countries it is they who are now in power. The 'upsurge' that Mohanty speaks of is situated within this restoration, this counter-revolution, and its evaluation must take place within that context and not in an imagined context of socialism. If, under such a dispensation, the people want freedom of expression and assembly, multi-candidate elections, and the right to associate and organise, the demands are entirely defensible, but neither do the demands constitute socialist freedoms, nor do those who are in consequence killed by the state become martyrs in the cause of socialism.

The real question of civil liberties in socialist societies must be debated outside the context of these 'actually existing socialist' countries for the conditions of the problem have been abdicated by them. Let us forget those countries and think of India. Any revolution in India, we all agree, will have to fight the caste system and caste values. Such a revolution will in all probability claim for itself the freedom to force upper caste bureaucrats to work as *chaprasis* to harijan officers at least a couple of days every week; it will further claim for itself the freedom to force all men to wait upon their wives; and also the freedom to force intellectuals to weed crops or carry dung; and the freedom to force managers of factories to work on the shop floor; notice what new meanings the word 'freedom' has started acquiring (perhaps *this* is 'socialist freedom'?). But it will be argued that all this must be done by the harijans, the women, the carriers of dung and the workers, and not by the state. Quite apart from the fact that this still leaves the question of civil liberties open, what happens if the victims of these freedoms organise themselves and resist the change, not in the name of caste and patriarchy (they would not be stupid enough to do so) but in the name of religion, *dharma*, order, progress, science, modernisation or patriotism? These will not be just a handful of class enemies against whom no prolonged repression will be required, and whom the unarmed masses can face and vanquish. The defenders of religion, order, progress and the nation will be from among the masses themselves, frequently from among the very masses whom the revolution is to liberate. While a socialist society cannot set about exterminating all of them, and must concentrate on exposing the illusory nature of the issues raised, it cannot close the option of violence or at least the threat of it except under exceptional conditions of empathy between the revolutionary masses and the state. It is a suicidal brand of idealism to believe that the revolution can ignore the question of state power and leave it to mass initiative to effect social transformation. The revolution can only be effected by a close combination of the masses and their state, of education and compulsion, of mass initiative and centralised leadership. How to ensure that the basic civil rights necessary for a dignified existence are not violated even for those who disagree with the revolution is a real question that cannot be solved by wishing away the dilemma. Till now Marxists have generally believed that unlike capitalism which reproduces itself through formal institutions, socialism with its revolutionary task can only work through a heightened mass consciousness, awareness, participation and political leadership. It has implicitly been held that institutionalisation of the instruments of revolutionary transformation is impossible or undesirable, except in the case of the overarching guiding spirit, the party. This understanding, which puts too much of a premium on the prevalence of the right spirit and attitudes in the party, has been questioned off and on, and perhaps it is time to open a debate on this matter now, for such institutionalisation would create space for civil rights appropriate to socialism, without leaving them to the benevolence of the party. The lack of such an effort is painfully exposed when, in the course of the continuous struggle between revolution and counter-revolution that defines the mode of existence of socialism, the party either ossifies into a dehumanised bureaucracy or, worse still, ceases to be on the side of the revolution and becomes an instrument of counter-revolution.

Indian Oxygen Limited

Chairman's Statement

The following is the Statement made by Mr Bhaskar Mitter, Chairman, Indian Oxygen Limited, at the Fifty-fourth Annual General Meeting of the Company held on 26 July 1989

We have gathered here after a period of almost eighteen months consequent to the change in the Financial Year of the Company, and I have much pleasure in welcoming you all to this Annual General Meeting.

During this period the country's economy as a whole has performed well, thanks mainly to the good monsoon we had last year. According to the economic survey of the Government of India, the GNP grew by 9% in 1988-89, and industrial production by 9.3%, while inflation has been contained at an acceptable level of about 6%. It is now estimated that the average GNP growth during the Seventh Five Year Plan may be around 5.4% as against the original target of 5%. All this goes to show the increasing resilience of the Indian economy, which was able to take even the unprecedented drought of 1987 in its stride.

On the industrial front, while there are indications that during the Eighth Plan the private sector may be called upon to play a more significant role in the industrial development of the country, the overall pace of liberalisation and deregulation of the Indian economy, which had been initiated by the Central Government during the mid eighties, appears to have somewhat slowed down. I trust that this is only a temporary phase, and that the process of decontrolling the economy in selected sectors, which has already yielded significant results in terms of accelerated rate of economic and industrial growth during the Seventh Plan, will be sustained in the coming years.

Performance

The Directors' Report and the Accounts for the 18 month period from October 1987 to March 1989 have already been with you for some time. On a superficial glance at the operations during this period, one may be tempted to conclude that there has been a setback in your Company's performance. It is, therefore, necessary to examine the working in somewhat greater depth and I propose to highlight a few important issues in this regard.

Profit before tax for the period at Rs 495 lakhs has registered a marginal decline of 6% on an annualised basis over the previous year. At first sight this could be a disturbing factor, but this needs to be analysed more closely. Some time ago your Company took a carefully considered decision to embark upon the modernisation projects at Jamshedpur and Tarapur as these were essential for its long term viability. That the Company is already becoming inherently stronger as a result can be seen from the fact that the turnover has grown by 13% on an annualised basis--the highest rate of growth in the last six years. Furthermore,profit before depreciation, interest and tax (PBDIT) at Rs 2605 lakhs has registered an increase of 26%, and internal generation at Rs 1070 lakhs, a striking increase of 47% over the previous year on an annualised basis. However, a price has to be paid in the short run for the heavy capital investments. Between 1986 and the period under review on an annualised basis interest charges have risen from Rs 451 lakhs to Rs 874 lakhs, and depreciation has gone up from Rs 270 lakhs to Rs 533 lakhs. Consequently there has been a decline in profit before tax despite better operational performance.

In regard to dividend, a totally unexpected factor intervened this time. Your Directors have recommended payment of dividend for the period under review of Re 1 per share, which admittedly is not a satisfactory rate of dividend for a Company like ours. Based purely on the distributable surplus generated by the Company a higher dividend could have been recommended by your Board, and I would like to explain the reasons why the Board has made its recommendation for a lower dividend. A recent decision of the Supreme Court in the case of another company has raised some doubts about the manner in which provision for Investment Allowance Reserve is to be made in the Accounts. Hitherto a company could make provision of Investment Allowance Reserve in the year in which it is allowed related tax concessions. In accordance with this recent Supreme Court decision such a Reserve, however, has to be created in the year in which new plant and machinery are put into use to be able to avail of the tax concessions. The profit of the Company during this period is subject to only minimum tax under Section 115J of the Income Tax Act even without taking into account the Investment Allowance. Thus, but for the Supreme Court decision referred to above there would have been no need to make any provision for Investment Allowance Reserve in the Accounts which are before you. However, in view of this decision, your Directors have been advised that it would be prudent to make a suitable provision for the Investment Allowance Reserve. Accordingly, by way of abundant caution, a sum of Rs 425 lakhs has been transferred to Investment Allowance Reserve. This has absorbed the entire distributable surplus and there being no residual surplus for distribution of dividend, the requisite amount has been transferred from the General Reserve Account to pay 10 per cent dividend in terms of the Companies (Declaration of Dividend out of Reserves) Rules, 1975.

Gases

The workings of the operational Divisions have been dealt with in some detail in the Directors' Report. The Gases Division has shown a commendable improvement over the last year, with significant increase in both turnover and profit. Sales of Liquid Oxygen and Liquid Nitrogen have also increased substantially despite adverse business conditions, and the declining trend of Compressed Oxygen sales has been reversed. The Gases Industry, which saw the

emergence of substantial over-capacity due to proliferation of small plants, seems to be progressing towards a more stable market environment. I hope this trend will continue in the coming years.

The Jamshedpur Tonnage Plant has been fully loaded during the period under review, and has been operating satisfactorily. The second Tonnage Plant at Tarapur was commissioned in March this year, and was formally inaugurated by Shri Ramrao Adik, Minister for Industries, Labour, Law and Judiciary, Government of Maharashtra, last May. The plant has been running well since its commissioning, and various steps have been taken to increase volumetric sales of atmospheric gases in the Western Region. It is expected that the plant will be fully loaded during the course of the current year.

I had referred in my last Statement to two other Tonnage Plants, one at Hindupur and the other at Delhi. Unfortunately, the power supply position in Andhra Pradesh remains unstable and is unlikely to improve significantly in the foreseeable future. As you know, air separation units are highly power intensive and cannot be viably operated without adequate and uninterrupted power supply. It has, therefore, not been possible to proceed with the proposal for installation of a Tonnage Plant at Hindupur. As regards the proposal for the Tonnage Plant at Delhi, it was linked to supply of oxygen to the Delhi Water Supply & Sewerage Disposal Undertaking. Since satisfactory arrangements could not be worked out with this authority, this proposal has not been proceeded with.

I had also referred in my Statement last year to the Letter of Intent from the Alloy Steel Plant, Durgapur, for supply of oxygen. I am glad to say that work on the project for installation of two air separation plants, each of 400 cu.m/hr capacity, at Durgapur is expected to be completed in the near future.

Turning now to the other activities of the Gases Division, the Special Gases business has been growing steadily. A contract with the Tata Iron & Steel Company Ltd for supply of pure Argon has been finalised, and the project for installation of an Argon Purification Plant at our Jamshedpur unit at a cost of about Rs 4 crores has been taken up. The Health Care Products Group registered an impressive growth during the period under review. This Group, besides marketing medical gases and equipment manufactured by the Company, has also taken up marketing high-tech medical equipment manufactured by various overseas companies in The BOC Group. The Liquid Oxygen Explosives business also performed satisfactorily.

Welding

The Division performed strongly with the various measures taken during the few years for improving results. After finalisation of a collaboration agreement with Matsushita Industrial Equipment Company Ltd of Japan, work on the project for manufacturing a new generation of Arc Welding and Air Plasma Cutting Equipment using solid state technology has been taken up at the Equipment Factory at Calcutta, and is expected to be completed within the next few months.

Plant

We can legitimately be proud of the fact that it was our own Plant Division which fabricated and erected the second Tonnage Plant at Tarapur according to schedule. IOL's engineers, who also did much of the work on designing this Plant, have incorporated a number of new features in it based on the experience gathered from operating the first Tonnage Plant at Jamshedpur.

Finance

The term loans received from the Financial Institutions for financing the Jamshedpur Plant totalled Rs 1468 lakhs. Amortisation of the loan has already commenced, Rs 177 lakhs having been repaid to the Institutions during the period under review. I am pleased to say that the Institutions have sanctioned a modernisation loan of Rs 1800 lakhs for the Tarapur project out of which Rs 1350 lakhs have been obtained from them during the period under review.

Maharashtra Weldaids Limited

You may remember that Maharashtra Weldaids Ltd (MWL) is a company promoted by us jointly with the State Industrial and Investment Corporation of Maharashtra Ltd. MWL's project near Nagpur for manufacturing Welding Equipment, Welding Wires and Accessories was completed on schedule and the plant commissioned in July last year. MWL has been making regular supplies of Welding Equipment and Consumables to our Welding Division, and in its first nine months ending last March this company has made a modest profit before tax.

Future outlook

With the modernisation and expansion programme undertaken during the last three financial years constituting the bulk of the total capital expenditure of over Rs 67 crores, your Company is well poised to play its part in the expanding opportunities of our growing economy. I have already referred to the growth in turnover during the period under review. This increase in turnover is expected to be sustained during the coming years.

Despite the temporary dip in profit, the basic health of the Company has, in fact, improved, with both PBDIT and internal generation showing healthy growth. With the full loading and optimisation of the Tarapur Tonnage Plant during the current financial year, and the steadily improving performance of the Welding Division, Health Care Products, Special Gases and Liquid Oxygen Explosives business of the Gases Division, the operating profits as well as internal generation should record a progressive improvement. However, the distributable surplus may continue to be under pressure for a little while.

Directors

Mr S B Budhiraja, Managing Director, has expressed his desire to retire from the services of the Company on 30 September 1989 at the completion o[f] his five year term. Your Directors have accepted his decision with deep regret. He has played a leading role in the formulation of the major modernisation and expansion projects undertaken during the last three years and they have been implemented under his stewardship. Durin[g] the five years he has been Managing Direct[or] he has made a significant contribution to th[e] operations of the Company.

Mr S S Prasad, Vice President-Gases, is proposed to be appointed Managing Direc[tor] of the Company with effect from 1 October 1989 and a resolution seeking your approv[al] for this appointment will be proposed later [in] this meeting. Mr Prasad, who joined the Company's services two and a half years ago, brought with him vast knowledge and experience of industry, and he has succes[sfully] piloted the operations of the Gases Division during this period.

On his taking over as Managing Director [he] will be able to deploy his talents over the whole range of the Company's affairs.

Dr Graham Winfield and Mr John Stanley Hedley have resigned from the Board in Ma[y] this year. I take this opportunity to thank Dr Winfield and Mr Hedley for the valuable services rendered by them during their long association with the Company. The vacanc[ies] caused by the resignations of Dr Winfield a[nd] Mr Hedley have been filled by the appointm[ent] of Mr Robert McFarland and Mr David Parr. Both Mr McFarland and Mr Parr have been associated with the Company for a number [of] years in their capacities as senior executive[s] in the Overseas Division of The BOC Group and I am sure their rich experience will be o[f] great benefit to the Company.

In conclusion I would like to thank all thos[e] who work in our Company for their commendable effort during the period we a[re] reviewing today. As I have already said, the Company is poised to make steady progres[s] and I am sure that they will all unitedly be ab[le] to ensure that our hopes are fulfilled.

Bhaskar Mit[ter]
Chairm[an]

Note: This does not purport to be a record [of] the proceedings of the meeting.

The Son, the Father, and the Holy Ghosts

Susantha Goonatilake

Black Athena: The Afroasiatic Roots of Classical Civilisation, by Martin Bernal, Vol 1: **The Fabrication of Ancient Greece 1785-1985**; Free Association Books, London, 1987.

> After the rise of black slavery and racism, European thinkers were concerned to keep black Africans as far as possible from European civilisation.
>
> —Martin Bernal (1987) in *Black Athena: The Afroasiatic Roots of Classical Civilisation.*

> The track science has followed—from Egypt and Mesopotamia to Greece, from Islamic Spain to Renaissance Italy, thence to the Low Countries and France, and then to Scotland and England of the Industrial Revolution—is the same that of commerce and industry.
>
> —J D Bernal (1956) in *Science in History.*

MARTIN and J D Bernal, son and father, have in their respective books dealt with intellectual history from a social perspective. Yet, more than a generation separates their approaches.

J D Bernal was inspired in the 1930s by the Soviet writer Boris Hessen. Bernal senior then developed a largely eurocentric social history of science. Although his book was published in 1956, it was conceived before World War II and was largely written within the broad 19th century perspective "orientalism" (in the phrase of Edward Said).

In *Black Athena*, the son implictly questions the centrality given by the father to classical Greece. The father's generation—and the several generations before him—followed unconsciously a Eurocentric view in describing the intellectual history of the world.

Black Athena is essentially about how in 19th century Europe, the primacy of the Greek experience for later European civilisation and, through the latter, the dominant strands of contemporary "world civilisation" was socially constructed. The book concerns itself primarily with the glossing over in the 19th century of the Greek's own acknowledgements of their debt to other civilisations. This glossing over occurred when social imperatives operating in Europe and associated with 19th century imperialism and racism demanded a special place for Athens. Bernal's tightly aruged, nearly 600-page first volume, is part of a three volume work of reassessing this false history and of reconstructing a truer one.

Bernal describes how the Greeks themselves acknowledged their strong debt to Egypt, an acknowledgement which Bernal calls the "Ancient Model". The Ancient Model was ascribed to by many Greeks, among them being Herodotus, the father figure in Greek history. This Ancient Model was superceded only in the 19th century with the rise of European racism.

Because of racial and imperialist considerations, the Ancient Model had to be overthrown and replaced by something more acceptable. For "18th and 19th century romantics and racists it was simply intolerable for Greece, which was seen not merely as the epitome of Europe but also as its pure childhood, to have been the result of the mixture of native Europeans and colonising Africans and Semites."

A new model was now substituted which emphasised the European and Aryan roots of Greek civilisation over Egyptian and Semitic roots. A broad form of this "Aryan Model" denied even basic, well documented facts such as that of the Egyptian settlements in Greece. A narrower, more extreme form of the Aryan Model even denied any Phoenician influence.

In this first volume Martin Bernal details how the views on ancient Greece were socially fabricated from 1785 to 1985 to deny the Ancient Model. And, in a forthcoming Volume II, he proposes a revised Ancient Model, where Egyptian and Phoenician influences are again emphasised.

Although 19th and 20th century 'Source Critics' took the position that the Ancient Model was concocted only in the 18th century, Martin Bernal shows that this claim itself was a social construct. No one had in fact questioned the Ancient Model before the 18th century historian William Mitford.

Bernal records how aspects of the Egyptian heritage of Europe was transmitted through the centuries without a break. This thread can be traced from the times of the ancient Greeks through the Roman period, the Renaissance and the Rosicrusians of the 17th century to the Free Masons of the 18th century.

With the emergence of the paradigm of progress in the 18th century, a number of Christian apologists now promoted the Greeks at the expense of the Egyptians. This trend combined itself with two other dominant themes of the time, namely racism and romanticism. With the onset of slavery and the emergence of colonial empires, dark skinned, African people as originators of Greek civilisation were now considered incompatible with creativity and civilisation.

The fall of Egypt from intellectual grace was also accompanied by the rise of India in European eyes through the discovery of a connecting link between Sanskrit and European languages. For a short time India rose in prominence through a romantic

'Aryan' linguistic connection.

By the first quarter of the 19th century, the Ancient Model had fallen from grace. By then it was "scientifically proved" that philosophy and civilisation had indeed originated in Greece. This was very convenient for the psychological well-being of the ruling class in Europe. "After the rise of black slavery and racism, European thinkers were concerned to keep black Africans as far as possible from European civilisation." Gradually with the rise of anti- Semitism, a sustained attack was also made on the Phoenician contribution and by the 1930s the anti-Phoenician position had also been "scientifically proved."

After World War II the old geo-political order began to change. The Eurocentric order was being dismantled geographically through decolonisation and this had intellectual repercussions. The resultant post-World War II rethinking gave rise to attempts at revisionism of the handed truths. These efforts were partly under way by the 1950s and the 1960s. Bernal describes how with the help of Israeli scholars and under a new environment, the anti-Semitic elements in the given histories were now being closely re-examined and history was being restructured.

At the same time we should note that other countries in the ex-colonial lands were also re-examining their own histories. Bernal's book is therefore a constituent and important part of these efforts at dismantling the old intellectual order and restructuring a new one.

Bernal has constructed his case drawing carefully from a wide variety of sources. Yet the Aryan Model he demolishes has been hitherto supported by a well entrenched intellectual stratum. Around this model has been implicitly created a total intellectual history and a large number of publications, as well as a host of influential academic positions. This was an implicit establishment which even for Martin Bernal's own father, functioned as the factual bedrock from which to view scientific history. This book is therefore bound to ruffle several feathers in this entrenched academia.

Yet it comes at a time forty years after decolonisation when Eurocentric histories are being freshly re-examined. It is a time when winds of intellectual change are blowing from the new historical research on North Africa, West Asia, South Asia and East Asia. This research is questioning the facts on which the largely European trajectory for science and knowledge had been built. Martin therefore writes amidst a major reorienting process, at a time when a new brand of scholars from the Afro-Asian lands are rewriting their intellectual history and forging new intellectual visions.

To the latter Martin Bernal's book is both a partial liberation as well as a partial prison. It is a liberation in the sense that it dismantles a racialist and imperialist vision which had been constructed on very little evidence. It is a prison because Martin Bernal still holds implicitly to a broad Eurocentric vision. Although *Black Athena* re-examines the relationship of Egypt to Greece, Bernal does so still within a broad and implicit view of the primacy of European civilisation.

Therefore whilst recognising Bernal's book as a liberating act of 'deorientalisation', one should also recognise the limits of this liberation. True liberation of a colonially derived intellectual history can only come when efforts such as *Black Athena* are also supplemented by similar exercises on other regional civilisations. The raw material f[or] such an examination amply exists in une[x]amined manuscripts and undug archaeol[o]gical sites. Already several Afro-Asia[n] writers have laid the ground-work for suc[h] rethinking. In the coming decades, we a[re] bound to see an intensification of this r[e]examination of laying to rest the holy ghos[ts] of colonial intellectual history. When th[e] truer history is eventually written, Marti[n] Bernal's painstaking efforts will stand as a[n] important contribution to the liberation o[f] the human spirit.

Regional Planning for Employment

Jeemol Unni

Bringing Jobs to People: Employment Promotion at Regional and Local Levels edited by Jean Mayer: Sterling Publishers, New Delhi, 1989: pp 211, Rs 150.

UNBALANCED growth between regions in countries at all levels of development occurs as economic growth proceeds and significant changes take place in the structure of the economy. This becomes a source of social injustice, tensions and instability. The present volume emphasises that a balanced regional development can "bring jobs to people" at the local level through regional planning and help mitigate social and economic tensions. Broadly regional planning becomes necessary for the following reasons:

(a) Inter-regional disparities cannot always be tackled by a national plan. Regional planning helps to fill the gap between the national plan at the aggregate level and the physical plan at the local level to meet some of the demands of the people like employment, incomes or infrastructural facilities.

(b) Regional planning to create employment opportunities and infrastructural facilities is necessary to prevent large scale labour migration.

(c) In federal and unitary countries there is some form of local government closer to the people. Some devolution of power to the regional government is necessary to meet the aspirations of the people.

The book under review is an edited volume consisting of eleven articles which originally appeared in the *International Labour Review*. In the introductory chapter, the editor provides an overview of the papers and highlights the need for a solid regional development theory conducive to employment promotion at the local level. The eleven papers have been grouped into four parts according to the aspects of regional employment development discussed by them. The two articles in part I by the editor review the theory and practice of regional employment policy and planning; the experiences of various countries in this regard are also discussed.

Articles in part II focus on the urban and rural approaches to regional employment development. Paul Bairoch pleads for a policy to limit the size of cities to medium sized agglomerations of 3-4 lakh population. This is ideal from the viewpoint of employment and conditions of life; with an increase in size beyond this, the disadvantages outweigh the advantages.

The lack of a national-regional planning system is clearly reflected in the rural areas in countries like India. Most employment generating schemes may have some effect in the short run, but do not constitute a solution to the problem in the long-run, since the main obstacle in less developed countries is the land-tenure and land-use systems.

A S Oberoi reviews land settlement programmes and reasons for their failure in many countries. Settling population in new lands is often undertaken as a substitute for land reform which is politically difficult. For such a programme to be successful a well planned long-term settlement policy has to be devised which considers the problems of second generation settlers as well. This needs to be integrated within a regional framework that includes development of an agro-industrial and services sector. He argues for the alternative of a rigorous land reform in already well-settled regions where there is scope for increasing agricultural productivity through the introduction of irrigation. There is an urgent need to review settlement policy in the light of ever-increasing real costs of new settlements in more marginal lands. The alternative of increasing agricultural output and achieving a more equitable distribution of land and incomes through intensifying cultivation along with comprehensive land reforms has to be considered. That is, settlement of increasing populations within the regional context through an employment programme included within the regional plan is desirable.

The two articles in part III are clubbed together on the ground that they consider two innovative methods of data collection and analysis applicable to developing and developed economies respectively (Lothar Richter and Denis Maillat). Denis Maillat's paper is however more than just a strategy for data collection. He devises a method to

study the labour market, its structure and functioning in a well developed market economy. The study points to the need to strengthen the mobility channels in a region. What is important for a region is not just employment but a combination of jobs and scope for vertical mobility which is the decisive factor in a high quality labour market structure. Regional planning is necessary to make the most of the development potential of a region to create jobs and preserve attractive and diversified employment structures at the regional level.

The last part of the volume presents some case studies at the country level. The first two papers emphasise the need for regional development to stimulate employment creation taking the case of Madagascar (C Rabevazaha) and North-East Brazil (Jorge Jatoba) respectively. Gaude, Guichaoua, Marteus and Miller's paper evaluates five special public works programmes implemented in Burkina Faso, Burundi, Nepal, Rwanda and the United Republic of Tanzania. And finally Peter Kuenstler reviews some local employment initiatives in western Europe.

Overall, the usefulness of the volume lies in focusing attention on the need for regional planning to tackle the problem of employment at the local level. In the Indian context, the growth process in the economy has failed to absorb labour productively in agriculture or industry. There is a growing tendency to treat the unemployed rural population as a residual and tackle their problems on an *ad hoc* basis through government-sponsored relief works and programmes. This amounts to treating the question of the distribution of income separately from that of production. The problem of rural unemployment and poverty cannot be disassociated from the overall strategies of industrialisation and planning. The employment situation of rural labour and their conditions of living can be improved only if the country plans for absorbing them productively in agriculture or industry. These aspects need to be considered within a framework of an integrated development plan, both at the regional and national level, and not merely through stop-gap actions and programmes. As emphasised in this volume, given proper perspective and planning, the removal of regional economic dualism of the country can go a long way in helping to solve the problem of unemployment both in rural and urban areas.

Women and Ecology

Sharad Kulkarni

Tribal Women and Forest Economy: Deforestation, Exploitation and Status by Walter Fernandes and Geeta Menon; Indian Social Institute, New Delhi, 1987: pp 178, Rs 35.

AT last the gender issue has invaded the field of ecology and that too very effectively. In 1986, Bina Agarwal came forward with a very good work on the effect of wood-fuel crisis in the third world and particularly on rural and tribal women.[1] Agarwal tackled the issue in a very general way covering a number of countries in Asia and Africa.

The book under review is a study of a micro-region in Orissa. The object of the study is to analyse the role of tribal women in the informal forest dweller economy. Several examples in the book illustrate that though the negative consequences of deforestation, namely, reduced food supplies, increased distance from forest and deprival of medicinal herbs without access to modern alternatives, are felt by all the forest dwellers, they are felt more by women than by men. This is mainly because of the present division of labour in the family. Women collect fuel and fodder and the workload relating to these activities is increasing day by day.

Because of deforestation, employment opportunities in forestry are gradually declining and men have to migrate to other areas seasonally in search of jobs. This results in further increase of workload on women. Thus, environmental deterioration has resulted in the deterioration of women's social, physical and economic status. It has weakened tribal communities in general and the social organisation of their women in particular. One of the findings of the study is that though the status of tribal women is much better than that of Indian women in general, the discriminatory values are being slowly but definitely extended also to forest dwellers in Orissa. This is true of all the tribal communities in the country. The authors plead for a very active involvement of women in all the programmes of afforestation. They have recommended community plantations with women's involvement. An example of plantation schemes implemented mainly by women in the Vishakhapatnam district of Andhra Pradesh under the guidance of the Bhagavatulla Charitable Trust is cited, alongwith schemes run by Sewa Mandir in Rajasthan and Gram Vikas and Prem in Orissa. The authors also recommend the popularisation of fuel-saving and smokeless chullahs. The findings are the result not of a formal survey but of observation and discussion by an active participant.

It is pointed out that deforestation leads to immiserisation and pauperisation of the tribal communities and it is necessary to effectively implement all the available poverty alleviation programmes, health schemes and programmes for women. The authors rightly complain that though women contribute more than men in terms of the amount spent in cultivation, collection and processing of forest produce, their role is often ignored or at the most given insufficient importance in the formulation of forest development projects. They plead for a change in the official attitude.

Recently, Vandana Shiva has come up with a very comprehensive study of the effect of ecological deterioration on women.[2] She forcefully argues that there is an intimate link between the degradation of women and the degradation of nature in contemporary society. The masculine arrogance of technology and the concept of man as the conquerer of nature lies at the root of modern economic development which is the main cause of ecological destruction. The fight for ecological stability is basically a fight against the mania for accumulation, more and more production and modernisation. The book under review is a good supplement to these general studies by Bina Agarwal and Vandana Shiva. The findings are supported by plenty of data.

Notes

Unemployment, Technological Dynamism and Need for Government Intervention

A Closer Look at 1989-90 Budget

Arun Kumar

Government needs to be viewed not in isolation but as the totality of the interests it represents. Its policies are the outcome of the pressures from the ruling interest groups—whether the organised sectors, agriculturists or foreign interests trying to enter the economy and sections of Indian business trying to keep them at bay. Government policies are constrained by these political realities and its capacity to utilise the economy's resources more rationally is limited in the process. The result is a vicious circle. Resources are wastefully utilised which increases social tensions and demands on the government and then feeds into more waste.

The 1989-90 budget reflects the incapacity of the government (and the ruling classes it represents) to take the steps necessary to break out of the low growth trap the economy finds itself in. The fiscal crisis facing the government and limiting its capacity to intervene in the economy remains unchecked. Efforts at creating employment are too small in comparison to the needs. Little dent is likely to be made on raising resources through the taxation of services. Technology is unlikely to 'take off' to raise 'efficiency' or reduce costs to make Indian goods export competitive. The capital goods sector is likely to face greater difficulties.

I

Is There a Resource Crunch?

THE budget for 1989-90 is being described as pro-poor or anti-rich or as an election year budget. It is being applauded for its attempt at fiscal discipline and for setting greater stress on employment creation, specially for the poor. It has also been noted for making a beginning at taxing services and introducing greater competition in the economy by deregulating prices of aluminium and cement.

In his budget speech, the finance minister noted that under RLEGP and NREP, "67 crore mandays of employment were generated during 1987-88 as against the target of 50 crore mandays". Not satisfied, he added, "a direct attack on the problem of *unemployment* is essential" and stressed the need to "allow fuller employment opportunities to at least one member of each family living below the poverty line... The provision of this new programme will be Rs 500 crore in 1989-90. Including this, the provision for employment programmes will be Rs 1,711 crore in 1989-90" (pp 8-9). "Agriculture and fertiliser subsidy... provision is being stepped up and will reach a level of Rs 5,173 crore" (p 11). These are the specific pro-poor steps in the budget.

The anti-rich features of the budget are taken to be the increased burden of taxation on the rich. These are to provide the required resources for employment generation. The income tax surcharge is being raised by 3 per cent for this purpose. The finance minister is also increasing the taxes on the consumption of the rich. This last step is also to "discourage low priority imports which go towards the consumption of upper income groups" (p 7).

The attempt to narrow the revenue account deficit in the budget is taken to be the first step towards greater fiscal discipline. The defence burden, the second largest item in the revenue account, is being held in check. In real terms the defence budget would be lower than in the preceding year. The contribution from the public sector units to the budget is slated to rise. The finance minister notes with obvious satisfaction that "...their net profit rose to Rs 694.19 crore from Rs 69.79 crore in the corresponding period of 1987-88" (p 3). This trend is expected to continue in the coming year as well.

In the pre-budget *Economic Survey* and in the budget speech, the government suggests and most analysts agree (a) that the economy has done well in 1988-89 and (b) that it is likely to continue to do so in 1989-90. Everyone also agrees that government is facing a fiscal crisis, a resource crunch. In other words, *the economy is doing well but that is not reflected in the state of health of the government's finances.*

Agriculture having recovered from the 1987 drought would grow at 20 per cent.[1] This is not due to policy. However, the finance minister says, "For four years in succession, manufacturing output has grown by over 8 per cent per year which is a clear vindication of the industrial policy of the government... the plant load factor of thermal plants has gone up from 50.1 per cent in 1984-85 to 56.5 per cent in 1987-88" (p 2). In his opinion, the problem areas are "the stimulation of savings and the containment of the budget deficit... measures to restrain luxury consumption... prudent management of public expenditures" (pp 4-5).

These reflect the government's concern at the growing fiscal crisis. This is not simply a result of the growing expenditures by government but the past catching up. The better performance of the economy implies that more resources are being generated in the economy. However, the government is unable to tap them to improve its financial viability.

Today, the budgets of governments (at all levels) in India affect over 40 per cent of the national income. The manner of mobilising and spending these resources affects the actions of other economic agents. *The fiscal policies of government affect the direction of use of the nation's entire resources* and are critical for making their best possible use.

Government needs to be viewed not in isolation but as a totality of the interests it represents. Its policies are a resultant of the pressures from the ruling interest groups whether the organised sectors, agriculturists or foreign interests trying to enter the economy and sections of Indian business trying to keep them at bay, etc. Government policies are constrained by these political realities.

Government's capacity to utilise the economy's resources more rationally—rational both in the sense of fuller utilisation and the direction of utilisation—is limited in the process. The result is a vicious circle. Resources are wastefully utilised which increases social tensions and demands on the government and then feeds into more waste.

Wasteful use of resources and the opportunities for development foregone are then at two levels. The waste when resources remain potential and do not become actual, that is, they are left unutilised. The second concerns the misallocation of that which is actually generated. An example of this is the unbridled expansion of the bureaucracy. Expenditure on it is one of the factors for the

growing fiscal crisis in India. The fiscal crisis is a result of both forms of waste.

In a nutshell, concessions demanded and obtained by those represented in the power structure lead to an ever increasing draft on the nation's resources. This is not all. *They also determine the manner in which resources can be mobilised.* This reduces the capacity of the government to set in motion the unutilised resources in the economy. Though obvious, *unemployment is the biggest waste in the economy. It is often unstated and ignored since the unemployed are politically unrepresented.*

It traps the government in a vicious circle of having to mobilise more and more resources for the same economic effort [Kumar, 1988b]. On this, the finance minister says, "...As much as two-thirds of the budget expenditure really take the form of financial transfers to other spending entities by way of interest, subsidies, grants, loans, etc" (pp 4-5).

These trends show up in the budget year after year in the form of the growing fiscal crisis. The growth in the economy remains low and appears as a crisis amidst plenty. This year with rapid growth, there are even more resources in the economy. These need to be mobilised for the growth process.

II

Election Year Gloss on the Budget

Some have argued that many of the features of the 1989-90 budget which are being hailed are mere tricks for putting gloss in an election year. For instance, the reduction of the deficit in the current account is a result of the reduced defence burden resulting from a lower provision for pensions. It is also the result of transferring Rs 2,300 crore from the oil pool. This is not a new item but the borrowing was never so large. It makes the deficit incomparable with the figure for the preceding years.

Capital expenditures are shown to rise little over last year's levels. The budgetary support to the Plan is shrinking while the public sector undertakings are expected to borrow directly from the market. The total deficit in the budget is not comparable across years—the borrowings component is not comparable.[2]

The budget for 1989-90 is not anti-rich by any means. In spite of the increased surcharge and tax on luxury consumption, the overall trend remains one of growing concessions to the rich. The high ratio of direct to indirect taxes remains unchanged. The former falls only on the better off sections. The latter, if it is to contribute significant revenues, cannot only depend on the taxes on luxury goods which have a high elasticity of demand and/or a narrow base of consumption.

Indirect taxes depend for a bulk of the revenue on items of mass consumption or intermediate or capital goods whose price increases work through the economy and fall on the consumption of the non-rich. This year too the increases in indirect taxes and freight will end up falling on the prices of items of consumption of the non-rich.

There are several concessions to the direct tax payers. Deposits under Home Loan Account Scheme will be exempt under 80C and from wealth tax. Capital gains from investment in National Housing Bank will be exempt under 54E. One third of the income from poultry farms would be tax free (p 27).

Beyond all this, the non-removal of the various concessions to the direct tax payers itself is a major concession. The various schemes of concessions, like under 80C, 80CC, 80CCA, 80L, 54E, 54F, etc, allow the tax payers to reduce their tax liability by a substantial amount and earn tax free incomes.

For instance, consider the impact of PPF and PF. Contributions to these schemes are tax free under 80C. The interest from it (around 12 per cent per annum) is also tax free. If the minimum contribution is one month's salary with another month's salary contributed by the employer, within 17 years, the annual accrual to PF or PPF becomes equal to the annual salary and that too tax free.[3] NSC have a similar effect. Salary earners and others in the taxable brackets are becoming rentiers.

The burden of indirect taxes has been raised this year too. The finance minister claims that 70 per cent of the excise duties are specific and need to be adjusted from time to time to bring them in line with their prices. Hence he has proposed an across the board increase of 5 per cent. He has tried to limit the damage by exempting items of mass consumption (p 29).

However, as mentioned earlier, the increases in excises on basic items like iron and steel or aluminium or capital goods would affect prices all round. Each of these items faces a rise in duties this year. If the budget was to be pro-poor, it ought to have raised the additional amount of resources needed through elimination of concessions on direct taxes. This would have also simplified the tax structure.

The 1989-90 budget is hardly anti-rich or pro-poor. Even if it was so, it is not guaranteed that the government may not reverse this year's trends after the elections.

III

Some Features of the Budget for 1989-90

Interest Burden and Risk of Investments

In the economy, the savings rate seems to be declining. The government implicitly claims that this is a result of inadequate incentive to saving. This has become the rationale for increasing interest rates in the economy. The savings in the economy are largely made by the households. Savings from the public sector and the corporate sector (in the form of accumulation of reserves) have been low.

The financial savings are with the commercial banking and the financial institutions of various kinds. There is a large element of tax concessions associated with savings in PF, PPF, LIC, fixed deposits, public sector bonds, NSS, NSC, post office deposits, etc. These are expensive to the government in terms of taxes foregone. The actual cost to the government is much larger than the interest burden.

The tax related savings are by definition relevant to the tax paying public. This implies perhaps 50 lakh individuals, i e, less than 0.7 per cent of the population. Considering that the rich households have more than one tax payer and often 4 or 5, the per centage of households in the tax paying brackets would be even less. This is where the tax-related savings originate and the return flow of the interest incomes from the government received.

Many in this group are turning from predominantly fixed income earners to property income earners with rent, dividends and interest incomes. Such individuals would still save the same if the government gave them a lower rate of return. The tax benefits are substantial. The reason why the interest rates have not been cut lies in the existence of the black economy and the informal credit markets [Kumar, 1988].

These high interest rates create a problem. The average rate of return expected from investment in industry needs to be higher to cover risk. With rising rates of return on government securities, the rate of return in industry also has to be raised through policy. Government has to either give more incentives to industries to make investment in industry attractive or few industries (those with high return) get started. Concessions add to the fiscal crisis.

One of the factors in investment decisions is the high return in black, i e, off the balance sheets. That is why, not only investment keeps on growing in areas showing a loss or low profits but also the control of industries, even if they are making losses, is important. The recent takeover bids (starting with Swraj Paul) need to be seen in this context.

Investment decisions today depend on the ability to manage the political environment. This is not only so for retaining the black incomes but also for getting concessions and licences. Cornering of licences through political manipulation yields monopoly profits. This is an important element of risk of investment. Favourable policies can get reversed under other pressures. For instance, take the case of consumer durables, like cars and electronics, in this budget. The new imposts on these items, by leading to a rise in their prices would reduce the size of their market and lower their profitability.

Policy gets itself into a vicious circle. Instead of dealing with the fiscal crisis directly, more and more concessions are being yielded to the property owners and this then becomes an additional cause for more concessions. The fiscal crisis continues to

deepen. The need is to check the growing black economy, cut interest rates on tax-related savings and to eliminate some of them. This would result in lowering the mounting debt burden, channelising savings into other avenues like industries, simplifying the tax structure and reducing the attractiveness of investments in real estate.

Indirect Taxes on K Goods

The confusion in policy is also reflected in the policy with regard to the capital Goods sector. Imports are sought to be made cheaper by a reduction in their import duties. This may not work if the foreign suppliers simply raise their prices. The foreign supplier may find that the internal price cannot be cut for various reasons, like impact of duties, etc, and that he would remain competitive even if he absorbs most of the benefit of the reduced duties.

An attempt to lower the price of capital goods is a laudable one. However, the high price of capital goods must be seen in the context of the fiscal policies, the scale economies available in the economy and the need to have a viable capital goods sector in the economy. High indirect taxes are a major reason for the high prices of various indigenous products.[4] These duties need to be removed before the indigenous industry can face foreign competition resulting from lowered import duties.

Import duties need to be viewed in the context of protecting the indigenous industry for strategic reasons of self-sufficiency. Even if scale economies are not available to the indigenous industry and, therefore, its product is expensive, it cannot be allowed to fade away. A price higher than the international price may have to be accepted. Import duties have to be pegged at a level consistent with the higher cost of production. Alternatively, production of capital goods could be subsidised to make its price internationally competitive.

Allowing more imports of capital goods where capacity exists (like, in power, cement, textiles) would further lower capacity utilisation and raise costs of manufacture. In the context of lowering costs, concessions to NRIs are being offered to bring in technology. Question arises why not also to indigenous entrepreneurs at the same rate?

Another proposal is to locate production elsewhere where capital costs would be lower. Again, for the sake of employment it would be better to set up the same facilities in India by granting them the same concessions as would be available elsewhere.[5] The free trade zones would be ideal for such a purpose.

The budget proposals on cheapening of capital goods on the grounds of reducing the cost lead of manufacture in the economy represent pressures for more concessions and need notto reduced prices. More specifically, the pressures are from the transnationals and the Indians abroad to allow them to enter the Indian markets. The government is forced to yield to these pressures due to its internal weaknesses on account of the fiscal crisis it faces. The Indian business classes which could be expected to oppose these moves are split on this issue and do not speak on this subject with one voice. There is a group amongst them which hopes to benefit in alliance with the external forces.

Pressures to cheapen capital goods is not stronger since Indian capitalists on the whole are not necessarily hurt by the high prices of capital goods for they are only interested in a return on their investment. With rising levels of interest rates, the capitalists demand and obtain greater concessions. In the process, as prices of capital goods rise they get a higher share of the national income.

The rising prices of capital goods reflect in the index of prices of capital goods rising faster than the general index. This reduces the volume of public investment fixed in financial terms. To step up the level of investment in the economy, to increase the growth rate, then requires greater incentives to the private sector. It has become an instrument for raising the share of surplus in national income. Countering this by imports of capital goods is no solution since that would throw the baby with the bath water. The need is to reorient fiscal policies.

Services Sector Growth and Fiscal Crisis

The share of the services sector in national income has been growing. Since the mid-Eighties, it has become the largest sector of the economy. It is suggested that since this sector lies outside the tax net the buoyancy of taxes is lowered. The argument runs as follows. This sector does not contribute to indirect taxes which are the dominant component of tax revenue. Thus a growing share of the national income is going out of the ambit of the dominant tax component. This analysis has a flaw.

Agriculture, the declining sector, does not pay direct or indirect taxes while the services sector at least pays direct taxes. As such, the base of taxation is growing. The base of indirect taxes has been the secondary sector and its share remains unchanged. As such, the base of taxation should expand and tax revenue must show a buoyancy greater than the rate of price rise plus the real growth rate of the economy.

The buoyancy in indirect taxes is a result of the spreading net and the rise in the rates. Many of these taxes are *ad valorem* (apply on the value of the good). The tax revenue then rises with the value of the goods. The value of the good includes the component of services going into the good. So, indirect taxes are also falling on services.

Imposing special taxes on productive services would raise prices of goods as is the case with indirect taxes. Taxes on consumptive services will have a smaller effect on prices. Since services are difficult to value, imposing an indirect tax on them will pose a major problem. Evasion of taxes in this case could rise unless better compliance ca[n] be enforced.[6] The high price of consump[tive] services may be economically acceptabl[e] in spite of the likely tax evasion since it ma[y] reduce their growth rate.

The purchasers of productive services, th[e] businesses, are largely indifferent to taxes o[n] services since what they pay for service[s] (produced in-house or bought in) are cost[s] to be deducted out of their profits. They d[o] not lower the gross profit of the businesse[s] unless sales are affected. Even then, service[s] are paid for out of pre-tax incomes so tha[t] their cost to the business is only a fraction of the price they pay. If services are to be taxed without affecting prices, direct taxes need to be used. The corporation tax should be levied on the gross profit, gross of the services. But then it would take on the character of an indirect tax—akin to a VAT including bought-in services.

The question then is how to make businesses more sensitive to costs. The threat that could work is a loss of markets, i e, a competitive environment. This is hardly likely in modern industry with the available scale economies. International competition could however be used. This is feasible, as suggested above, only if fiscal policies are modified to remove indirect taxes to lower the cost of production. Adding another indirect tax to capture expenditures on services is not going to force the indigenous industry to become competitive or to force reduction in prices.

In sum, a move to VAT, net of material costs only, may force businesses to economise on the use of services and yield revenue to the government. However, this is like an indirect tax which would put an upward pressure on prices and make the Indian economy less competitive. To counter this, if import duties are reduced to force lower prices, Indian industries would decline. The only way to bring the growing services sector in the tax net without raising prices or making industry less competitive internationally is by shifting from indirect to direct taxes, i e, a reversal of the current trends.

Technology: Constraints and Strategy

Lowering of production costs may be attempted through use of more advanced technology. Indeed, the government uses this as the justification for liberalising imports of technology and inputs. This argument has come in useful to the private sector, specially those who see their interests as tied to the transnationals and the NRIs, to obtain greater concessions, to increase their share of the national income.

Indigenous technology has not developed enough to be able to sustain the drive for new technology, hence the dependence on foreign technology. One of the principal reasons for this weakness lies in the *ad hoc* nature of the science and technology policy pursued in the country [Kumar, 1987]. It has

been pointed out that an important element of risk of investment in R and D is the rapid switches in policy itself.

This view on cost cutting is based on a narrow understanding of cost. The wider view of cost is a social one. For instance, today, the costing for environmental degradation is almost absent. This cost is being shifted to the future generations so as to cheapen goods made available today. On the issue of costs as social, some clarity could have emerged from the experience of the socialist economies. However, they are themselves giving up the concept of cost as being in large measure social. In the emerging view, public sector is seen as inherently inefficient and unable to adapt quickly to a changing situation and unable to lower costs in face of competition.

The concept of cost relates to the value of inputs in a given output. The more output can be obtained out of given inputs, the more is said to be the efficiency of the unit (industry or society), and the cost of production reduced. Lowering the cost of capital, the return on it and the interest rate structure would lower a component of cost of production.

The reduction in material input and services (going into production) per unit of the output lowers costs. This relates to the payments to labour—utilisation of the socialised labour. The less of it is used to produce a given volume of output, the more efficient production is and cheaper are the goods. If utilisation of labour in unproductive uses rises, society becomes less efficient, even if, individual units become more efficient in terms of their input-output.

Examples of such wasteful utilisation of labour are in over-blown administration, services related to taxation, etc. However, the biggest of such waste is underemployment/unemployment. This is socialised labour which needs to be economically supported but is unable to contribute to the output. Thus, in terms of input output, the cost rises. It also leads to missed economic opportunities which cannot be made up later.

Technology can be of the embodied or the disembodied kind. Changes in the system of organisation which allow a higher output per unit of labour like better governance, less of management personnel per unit of output, better organisation of work time as in an assembly line or shorter inventory lines are examples of disembodied technical change. It is in these aspects of technology that the socialist countries have been deficient. They have also been deficient in another area—marketing.

Marketing in the modern context is a means of inter-connecting the production process to demand. When change is rapid, as in a competitive economy with firms trying to capture each other's share through innovation, marketing becomes a critical skill. Socialist countries and public sector in India have ignored this area as being unnecessary, as being in the nature of an overhead and not related to production. However, in the absence of alternative structures to do this task, this skill is a force for dynamism and innovation in a fast changing market structure. Economic entities unable to respond quickly to changes in the market place need to evolve a mechanism corresponding to this skill.

Technical change in recent times has been accompanied by rising output per unit of labour. This is a result of the electronics revolution. With the micro processor based revolution, new products are rapidly becoming available, precision has greatly increased and capital costs have fallen. Output per man has also increased as a result of the changed labour process used in computer based production.

The increased division of labour in production processes was the basis of earlier mechanisation in factories. It involved the worker in repetitive work which could be performed by him at great speed. Output per unit of labour went up. This historical trend seems to be getting reversed now. Machines can perform tasks repetitively much faster and with much greater precision. This displaces large amounts of labour. It is doing so in not only relatively unskilled jobs but also in skilled ones. Employment is being generated at a skill level one step higher, in design and conceptualisation of the production process.

These trends are also raising productivity per unit of labour in the hitherto stagnant area of services. Offices, banking and finance, etc, require far fewer workers for a greatly expanded volume of work. Such large increases in output per unit of labour reduce the component of labour in output. Cheap labour without access to technology and skills then is no more an asset in international competition and in any export drive.

Technological changes are also seeping into the Indian economy. Government is allowing import of advanced technology. The imports are also growing due to the rising demand for consumer durables and luxury items which are import intensive. The growing volume of imports require growth in exports to maintain the balance of payments. International competitiveness has become important for exports.

This requires importing technology for the export sector similar to that available abroad and fuels further imports. Imported modern technology is raising output per unit of labour in the Indian economy. Since this is accompanied by growing imports, the volume of internal production cannot rise commensurate with the growing labour productivity. It leads to a trend of growing unemployment and underemployment and of social waste even if some firms become more efficient in the narrow sense.

In sum, the debate on the liberalisation of the economy and making it more efficient confines itself to the firm level efficiency defined in terms of input and output. Its link with the efficiency at the national level is ignored. At the national level it needs to be measured in terms of various social indicators. For instance, deficiency of demand and the resulting unemployment and the unutilised capacity can make the most efficient plant inefficient in the national context. By raising social tensions, it raises social costs which are seldom counted. Policy needs to face these issues squarely.

Slow Growth and Capacity Utilisation

In a capitalist economy, employment depends on investments. Given the distribution of incomes, if there is spare capacity in the economy, a stepping up of the level of investment leads to a stepping up of employment. However, *in a capitalist economy the private sector does not automatically invest the amount necessary to take the economy to full employment or to the maximum possible rate of growth.*

Investment decisions are known to lead to instabilities in capitalist economies. With its atomistic decision-making, the investment decisions based on the prospects for future profits become either unduly pessimistic or optimistic. This results in fluctuations in economic activity. Government intervention can even out such fluctuations.

In the Indian context, slow growth in some of the major sectors imply that demand is inadequate and on the average, incentive to invest low. The lack of demand in the economy reflects itself in excess capacity in certain sectors and sickness in others. This in turn reflects in low capacity utilisation in say, the capital goods sectors. *The private sector is unable to* significantly *step up growth by increasing the rate of investment even though (as data show) the propertied classes are getting a growing share of the incomes in the economy.*

With slow growth, investment in productive assets does not promise adequate returns. The growing surplus in the economy gets channelled to activities which promise the highest return. Speculating on shortages is one such, typically in commodities or in non-reproducible assets like, land. The more money flows into such activities, the more their prices rise and the more they attract funds. This sets up a vicious circle of price rise and investment in unproductive activities. Trading and real estate have become favourite activities amongst the surplus owners.[7]

The low growth in demand in the economy is manifested, in the short run, in idle production capacity and increasing levels of stocks. Over the medium run, it would manifest itself in declining levels of investment in related areas (so that the level of capacity utilisation does not fall further). Over time, capacity utilisation would rise as demand rises for natural reasons and old machine stock depreciated.

Capacity under-utilisation may remain substantial in industries where the gestation period of investment is long, like in basic industries and for infrastructure. This has been

observed in the Indian context. The main impact of deficiency of demand then is on the rate of growth of the economy. It remains low due to the low rates of investments.

The economy is trapped in a vicious circle of low growth, and worsening distribution. To correct for this, at a minimum, the growth rate must be stepped up keeping in mind employment generation. The Indian industry came out of its low growth phase (starting in mid-sixties) in early eighties. This possibly was a result of an all round decline in excess capacity in the economy and opening up of new investment opportunities. In the infrastructure sectors, due to a lack of adequate investment in the sixties and the seventies, even bottlenecks appeared.

The failure of the public sector to lead the growth in the economy in the seventies led the government to shift emphasis to the private sector. The trends the world over to either denationalise or to open the economy to private sector (in the socialist economies) gave a sanctity to this idea. Public sector is seen to be inefficient. The worker in the public sector is seen to be inefficient. He is supposed to lack incentive to produce in spite of the high emoluments he receives.[8]

A growth area was chosen to encourage private investments. In the eighties, it was the consumer durables industry. The rising incomes of the propertied were to be the source of demand to fuel the growth of the Indian economy.

Government seems to have realised the limitations of this strategy. It had a narrow base. This could conceivably have been supplemented by raising employment for the poor through special employment schemes. However, resources were required to be raised from those who have them, the propertied. But, this went contrary to the idea of allowing higher incomes to the propertied to stimulate their consumption.

The budget for 1989-90 seems to have targeted food processing as the new growth area. It is hoped that it would stimulate the growth of the agricultural sector and employment. Various concessions have been offered to this industry. A new ministry has been set up specifically to oversee the growth of this area. However, the trends are that this area too would be highly capital intensive and foreign technology intensive. Large number of transnational companies are trying to enter this market.

It could no doubt lead to a smoothening out of the fluctuation in agricultural prices. It could, therefore, lead to a shift in the terms of trade to the benefit of those farmers who have the marketable surplus. But, its impact on the rest of the consumers would be negative, specially on those below the poverty line and who depend on the low prices of the seasonal food items for their consumption. If employment and incomes rose this would be countered but the rising output per unit of labour could prevent this from happening and aggravate the crisis.

The growth of a capitalist economy is *helped* by the existence of an external sector which generates additional demand for the national economy. The export market has traditionally played this role. It raises demand beyond what the internal economy is itself capable of generating. The result is more investment, utilisation of idle resources and more growth. However, as argued, this has led to import of technology and to a rise in the output labour ratio which can aggravate the tendency of deficiency of demand in the economy.

IV

Government Intervention, Technology and Investment

There is an interlinkage between, on the one hand, investment, technology, the rising shares of surplus and the services sector in the Indian economy and on the other, the low growth rate of the economy. The linkage with the latter two was discussed in Kumar [1988a].

The link with technology and investment is taken up for discussion here. It is a well known feature of these two that they have a dual nature. Whereas investment leads to a rise in the level of output, it also leads to a rise in the level of capital stock and reduces the opportunities for future profitable investments. This has been exploited in the models of business cycles to explain economic cycles.

Technology can also have a similar impact on an economy. On the one hand, it propels investment in the economy since firms would like to take advantage of the higher levels (than those who do not use it) of profits it allows. This raises the level of output in the economy. On the other hand, if the output per unit of labour rises, it raises the share of the surplus in the economy (and lowers the share of wages) and reduces the level of employment at a given level of output. The wage bill (for a given output) shrinks and leads to deficiency of demand which causes a downturn in economic activity. The net effect depends on several factors.

The consumption out of surplus may rise. However, it is not very sensitive to the rising levels of incomes of the surplus earners.[9] Worse, even the slow rise is lagged. Investment activity is also lagged on profits. Profits, investment decisions, increases in production of investment goods and deliveries of capital are all lagged with each other [Kalecki, 1971]. The immediate effect of a rise in the share of profits would be a decline in overall demand in the economy.

A rising share of profits is likely to be accompanied by a tendency for overall demand to be deficient in relation to the productive capacity of the economy [Machlup, 1960]. An increase in the rate of investment is then needed to prevent slow-down in growth.

This is not automatic since capitalists fear economic obsolescence and the rapid depreciation it requires. Only if technical change brings with it new products and requires newer lines of production to be opened does the level of investment rise and reverse the trend of growing deficiency of demand. Thus, the nature of the technical change is important from the point of view of its net impact on the rate of investment and whether it enables the capitalist economy to correct its own deficiency.

A rise in the level of output per unit of labour brings with it a possibility of reduced prices. This could raise the purchasing power of the employed and raise the level of demand. However, such an outcome does not come about for two reasons. First, there is the productivity inflation. It is based on a rise in productivity in some industries and sectors and not in others. The wage rates in the productivity leading areas rise and spread (as norms) to others. The average prices go up rather than falling [Streeten, 1962].

Second, capitalists with control over technology prefer to expand margins and raise their levels of profits rather than lower prices. New technology usually has a scarcity premium and allows monopoly profits. The existence of the older technology for reasons of incomplete depreciation and niches in the markets and slow junking of old plants prevent the prices from falling. A rapid spread of the new technology can prevent profit margins from rising.[10]

There is another critical reason for why a rising level of labour productivity is not leading to a commensurate decline in the prices. This is a result of a rising concentration and specialisation in production. These tendencies lead to a rising demand for services for final-sale of the product. Till recently, the growth in productivity in the services sector has lagged behind than in the material goods sectors. As a result, the rising share of services in the national economies is leading to a slow-down of the tendency of cheapening of goods. The prices of final products hardly fall, if at all.

Consumer resistance (among the organised sectors) to price rise is weakened in a situation of rising prices. Not only do expectations of price rise and that the price rise can be neutralised by pay increase get entrenched in the economy, but also, any idea of cost of production is absent. With a new product the idea of its cost of manufacture is bound to be even weaker. Product differentiation through advertising and marketing techniques tries to present even old products as new. This is inflationary.

The transnationals enjoy enormous clout in terms of market power due to the financial strength, image and brand names. They are able to charge fancy margins for their products. This is also true for the large indigenous producers in the third world, including in India.

Finally, the consumer resistance is also weak due to individual items of purchase being a tiny fraction of the overall family budgets. The budget constraint does not act on individual items of purchase. Price rise

affects the savings propensity. For the middle classes in India, the budget constraint acts on the purchases of consumer durables.

To sum up, technological change by raising the level of output per unit of labour tends to create a deficiency of demand in the economy. This tendency could be countered by a cheapening of products of new technology. However, this is prevented from happening by the prevailing institutional factors in a capitalist economy. The existence of an external market is a possible way out of such a situation.

A Model of Deficiency of Demand

In a capitalist economy with ongoing investments and an accompanying technical change, the impact of these two on the tendency for deficiency of demand, growth rates and the need for external markets needs analysis. This is attempted here.

Technology is the crucial link in this model. It is represented by output per unit of labour, say, β. β rises with the level of investment in the economy. As newer machines are installed, the average level of output per unit of labour rises. Disembodied technical progress would raise β without any investment. With embodied technical progress, at a given level of investment, as newer machines come into use, β can be expected to rise.

The rise in β at a given level of investment can be expected to be larger or smaller as the pace of technical change varies. For instance, with the electronics and computer revolution, the pace of change has become far more rapid.

A rising β at a given level of output would lead to unemployment and a rising share of the surplus. This would lead to a deficiency of demand in the economy unless counteracted by a rise in investments.

With a rising β, the share of profits rises and would induce a higher level of investment decisions and lead to larger deliveries of equipment. Capitalist consumption would also rise with a time lag. Since the immediate impact of the rise in β is on employment, the deficiency of demand would result from the decline in workers' consumption.

β would then raise the level of investment and increase the deficiency of demand in the economy.

Let investment be expressed as a ratio of the capital stock in the economy, and representd by ϕ.

Then, ϕ per unit of time would rise with β, as noted above.

ϕ would also rise with the level of output in the economy through an accelerator mechanism. But the level of output is dependent on the level of investment in the economy through the multiplier. Thus the rate of rise of ϕ per unit of time also depends on ϕ itself.

The existence of the deficiency of demand would imply the existence of spare capacity and act as a damper to the rise in ϕ. In sum, ϕ per unit of time would rise with β, with ϕ but decline with the deficiency of demand.

Let the deficiency of demand in the economy be expressed in relation to the level of output, and be represented by σ. As argued above, this would be lowered by a rising ϕ but raised by β.

These inter relations between β, ϕ and σ over time may be expressed in the form of the following linear differential equations:

$$d\beta/dt = a\phi.$$
$$d\phi/dt = b\beta + c\phi - e\sigma.$$
$$d\sigma/dt = f\beta - g\phi.$$

The coefficients a, b, c, e, f and g are taken to be constants. The constant parts of the linear functions on the right hand side of the equations are ignored since they would yield a linear time trend.

The characteristic equation for the solution of the coupled equations is
$\Omega^3 - c\Omega^2 - \Omega\,(ab + eg) + aef = 0.$

This is a cubic in Γ with three roots. One of the roots, say Ω_1, would be real and negative. The other roots can be real or imaginary. At least one of them would be positive or having a positive real part, say Ω_2. Thus, as $t \to \infty$, the root Ω_2 would dominate over Ω_1 and possibly Ω_3. If a, e and f are large, the roots $\Omega_{2,3}$ would be imaginary. (See Appendix for the details of the solutions.) The most general solution would be a linear combination of the independent solutions containing exp $(\Omega_i t)$ and the particular solution. e and f are unlikely to be small but 'a' may be small in normal times when technology is not changing rapidly. In normal times with 'a' small and $\Omega_{2,3}$ real and positive but with small values, each of the variables β, ϕ and σ would grow monotonically. Depending on the initial values, the constants can be fixed (in the general solution). One possibility that emerges is $\beta, \phi \to \infty$ while $\sigma \to -\infty$ as $t \to \infty$.

With 'a' large, the roots $\Omega_{2,3}$ are likely to be imaginary. β, ϕ and σ would oscillate with increasing amplitude.

The role of the external market is precisely to fill the deflationary gap σ. This would determine the size of government investment in the economy or of the export market or the extent of destruction of the pre-capitalist sector. Clearly, the last is a limited amount and would be soon exhausted. The other two also have to be rising shares of the level of output since σ is a share of the output.

One of the implications of the case of real roots (aef small) is that the deflationary gap rises but in spite of its rise, the investment process and the technical change representing increasing labour productivity show an exponential rise. This is the result of the self excitement of investment and the mutual impact of β and ϕ on each other. The impact is on the lowered growth rate in the economy.

The full employment rate of growth would correspond to the situation where $\sigma = 0$ and $d\sigma/dt = 0$. Thus, $d\phi/dt = \phi.\ (c + bg/f)$. That is an exponential growth at the rate $(c + bg/f)$. This would be higher than the growth rate in the case when the deficiency of demand is present because the negative feed back on investment from the deficiency of demand has been eliminated.

The implication of an exponentially rising ϕ is that investment as a ratio of capital stock is growing and will become greater than the capital stock itself. An exponential rise in the output per unit of labour β would imply a reduction in employment.

The level of output would be given by the multiplier times the investment. As the share of profit rises and corresponding to the rise in β the wage rates also rise, the savings propensities of the capitalists and the workers would rise. They would approach unity. Thus, output would rise at the same rate as investment and output would equal investment.

The model points to the instability of the growth process accompanying a rapid change in technology. The large 'a' case with imaginary roots is a result of the impact of rising level of labour productivity leading to the creation of a deflationary gap which reduces investment and economic activity.[11] But as profits rise and investment increases, the gap would be narrowed and in turn would lead to a further rise in investment. The economy would undergo fluctuations.

To overcome this instability, the value of 'a' or 'f' could be lowered and 'g' raised. The effect of lowering 'e' is ambiguous. The roots $\Omega_{2,3}$ would become real and positive with these changes. Low 'a' and 'f' imply a choice of technology which create a small rise in output per unit of labour and a small effect of technology on creation of the deflationary gap. 'g' increases the impact of investment on the deflationary gap.

'a' and 'g' can be changed by policy. Inefficiency and corruption in government lower the size of 'a' and 'g'. A large part of investment decisions in the economy are in the control of the public sector and depend not only on the technological input-output coefficients but also on the political decisions. Where plants are to be located, with what technology, etc, is politically determined. These are subject to corruption.

These factors reduce the impact of investment on the rise in β. A given investment decision has a lower actual investment component when there is corruption. This makes 'g' smaller and makes the closing of the deflationary gap more difficult. Then, while waste lowers 'a' and reduces the crisis of demand deficiency in a capitalist economy, through 'g' it has the opposite effect.

Ceiling and Floor

The above model suggests an increase in ϕ, without a limit. However, investment can at most be the entire output of the capital goods sector. If only capital goods are produced in the economy, then the upper limit of ϕ is the output-capital ratio, Γ. This would provide *a ceiling rate of growth of the economy*. On the upswing, once $\phi = \Gamma$ (actually even before this is reached since a part of the output would be of consumption goods), the equation for ϕ would not hold.

Then, $d\phi/dt = 0$, $d\beta/dt = a\Gamma$ and $d\sigma/dt = (f\beta - g\Gamma)$ with Γ = constant.

β would then be a linear function of time and σ would be a linear and a quadratic function of time. σ would fall to begin with and then rise. Thus, the deflationary gap would grow due to the rise in β which a constant ϕ is unable to counter. The rate of growth of the economy would fall below the ceiling rate.

There is also a *floor* since capital stock cannot decline faster than the rate of depreciation. The equation for ϕ once again gets modified to $d\phi/dt$ = constant (with a negative coefficient). β would rise with time due to the autonomous technical change (constant term on the right hand of the equation which was ignored) but there would also be a quadratic term with a negative coefficient. β would initially rise and then fall.

σ would consist of a linear and a quadratic term in time both with positive coefficients and a cubic term with a negative coefficient. σ would initially rise and then fall sharply. This would provide the lower turning point. Therefore, even if an economy experiencing technical change can choose the coefficients appropriately such as to be in a regime of monotonic growth, the existence of the ceiling forces it to oscillate.

To grow at the maximum steady rate along the ceiling, the capitalist economy needs an external market to fill the deflationary gap that has a constant tendency to reappear and grow. This ceiling rate of growth need not be the full employment rate since σ is not zero. Exports do not easily respond to policy. So, the policy variable available to the government is direct demand creation. For this, the instruments available are deficit financing, borrowing or covering expenditures through direct taxes.

The tendency for the persistence of deficiency of demand even during the upswing should enable the government to intervene in the economy to eliminate the gap. Continued slow growth in the economy is an indication of the government not doing so. It has been argued that this is so by design since government is averse to rising levels of intervention which rise the potential rate of inflation in the economy (Patnaik, 1986).

The inflationary tendency has been attributed to the form of government intervention. Unsold stocks resulting from higher growth have to be bought by the government which then releases liquidity in the economy which is potentially inflationary. Further, labour militancy is supposed to rise as the economy approaches full employment. Money wages rise faster and so do prices. *These arguments are set within a conflict model of inflation.*

Government is supposed to slow down the demand generation process by cutting back its level of intervention in the economy. Since most current account expenditures are precommitted, the tax necessarily has to fall on the capital account expenditures and planned investments.

Data indicate that there is rising government intervention in the Indian economy. This is whether one looks at the tax revenue, expenditures less transfers, or total expenditures (including transfers) of all levels of government [see Kumar, 1987c]. In spite of this, the trend rate of growth of the economy has changed little[12] and it may be inferred that there is a tendency for the persistence of a deficiency of demand.

In the Indian context, the rising government intervention in the economy may be interpreted to lower 'f' and the economy grows monotonically at a slow rate. However, this is accompanied by a rising level of technological unemployment. Such labour goes into the unorganised services sector. The economy experiences a growing economic differentiation.

In Kumar (1983) and (1986) the arguments were theoretically analysed. In an India-type economy, there is a vast unorganised sector which bears the brunt of the inflationary adjustment and accommodates (is forced to do so) the rising shares of the organised sectors (Holzman, 1950 raised similar possibilities). Continuous inflation would continuously squeeze the share of the unorganised sectors. Question is why is the process not stronger? Are there limits to this process?

V

Growing Fiscal Crisis and Conflict

Conflict Model of Society

That there is a link between economic disparities and the level of social tensions is generally accepted. However, this is not a simple relationship. Disparities of different kinds have existed for a long time in most societies but have produced different levels of social tension.

A social structure with a given incomes ladder (which has historically prevailed) seems to be a source of social stability. Income relativities amongst different social groups in society seems to be important. A historical pattern of relativities (even when it is unequal) seems to carry with it a sense of economic justice and makes it acceptable to people.

In a rapidly changing social structure, as in India, where the income relativities also start changing, the growing social tensions aggravate. This happens with the creation of new possibilities for some groups and the elimination or the declining importance of (the work of) other groups. The ruling ideology in society at times reinforces such trends. In a capitalist society, the fixed income groups do not blame the business community for their declining standards (due to inflation) or act against it in spite of the latter's obviously rising standard of living.

Instead, they blame each other for trying to obtain a higher share of the national pie. These are the relativities they are directly concerned with in the social ladder even if these are not related to their economic decline. The pull of ideology is such that business practices have not only become acceptable to the middle classes but they even adopt them by abandoning their own practices.[13]

In recent times, with consumerism emerging as a dominant value, the income relativities are even more important than earlier. Status is not dependent on the individual's work but his show of consumption. The changes in income relativities become immediately apparent and the feeling of relative deprivation heightened. This hurts specially those who till recently thought themselves as equals and now are no more equal in their consumption pattern. The hurt is even greater when those who were taken to be lower in the ladder, move up.

These and the growing expectations of various segments of society are the links betweer the growing economic disparities and the level of social tension in a society. *In analysing the growing social tensions and nature of conflict in the Indian economy, it is, therefore, necessary to recognise the existence of sections which are getting marginalised and of those which are appropriating the gains from the growth process.*

In the typical model of a capitalist economy, the basic conflict in society is taken to be that between capital and labour. These classes are taken to be undifferentiated. This has been utilised by Kalecki and more recently by Rowthorn (1977) to analyse the phenomenon of inflation and stagflation in a capitalist economy. Patnaik (1986) adopts such a model in the Indian context.

In Kumar (1983), it was suggested that in the case of the Indian economy, it is necessary to separately incorporate the unorganised sectors of the economy even though the basic conflict remains between capital and labour. It was argued that a conflict model of the Rowthorn kind would be inappropriate for analysing inflation in the Indian economy. It has been pointed out that government intervention in the Indian economy is rising when measured either in terms of the share of taxes in the national income or in terms of total expenditures by all levels of government.

The issue is not *that government is* not *intervening in the economy more and more* but *that the problem of accelerating the growth rate in the economy has not been solved by the rising level of government intervention* [Kumar, 1986]. To understand this, it is necessary to closely examine the theoretical premises of the Rowthorn kind of model (which has been used in Patnaik (1986) to suggest limits to government intervention) and see whether they are valid in an India-like economy.

As in short run models, productivity is a given constant. The conflict between capital and labour is taken to be such that their demands on the national cake together add up to more than its size. This leads to inflation. The capitalists have control over prices and raise them to obtain the share they want.

This forces a cut in the real incomes (wages) of the wokers. So they demand a higher money wage which upsets the calculations of the capitalists. In the process, there emerges a vicious cycle of prices and money wages chasing each other.

Clearly, if workers only desire that a given real wage be maintained, conflict could be resolved if productivity rises. The capitalists would be able to get a higher share of their produce (as profit) while conceding the fixed real wage (asked for) to the workers. But Rowthorn rules this out by operating in the short run. However, in the model, repeated wage bargain are allowed so that the model actually addresses the longer run. An ambiguity appears in the model. Productivity *can* rise over the span of the wage bargains.

Further, confining attention only to the short run, if a wage bargain takes place between the workers and the capitalists at the start of the period, then by conceding a given real wage to the workers, the capitalists are also fixing and *accepting* a share for themselves, individually and collectively. This must be in consonance with the share of the national income that they collectively want. Thus, conflict between shares should not arise unless there is an external shock to the system. Such a shock must be continuous for it to produce a continuing inflation. Even here productivity rise may be able to resolve the conflict.

There is a possibility of an endogenous explanation (short run) of the kind Rowthorn has in mind. It would have to be based on some capitalists being dissatisfied with the bargain. These capitalists would expect to raise their prices (unanticipated) in the short period *by more than the average*,[14] after the bargain has occurred at the start of the period. The calculations of other capitalists would then be upset and they would be forced to also raise prices and the wage-price spiral initiated.

Such a scenario would require the incorporation in the model of a pricing rule for the oligopolists and the monopolists which would enable them to raise prices more than the average. Alternatively, they need to be technologically so dynamic (forget the short run for the moment!) that they can raise their profit margins without raising their prices more than the average. But then the unanticipated price rise would not occur and the wage bargains at the start of the short period would be consistent with the expected shares of profit in the national income.

It then appears that for Rowthorn's conflict model, *the model must consist of two groups of capitalists with one having greater market power than the other possibly based on the technological edge and control over markets*. This is missing and there is ambiguity about the short-run nature of the model.

With the mechanism of conflict suggested by Rowthorn (1977) untenable, one could fall back on the model suggested in Kalecki (1971). He suggested that capitalists and workers actually bargain for shares of the produce of a firm. The workers do *not* bargain with a real wage norm. Under the circumstances, it may be argued that conflict over shares in the national cake is not resolvable even by advances in productivity. Unanticipated price changes by firms only aggravate the conflict further.

A requirement of such a model would be that there exist a mechanism by which the individual shares in each industry add to a share at the level of the economy. No doubt, at the end of a short period, after conflict has played itself out, some shares of labour and capital would emerge. But *in a conflict model, the concern ought to be with the share formation mechanism at the beginning of the period*. A conflict over these shares is what initiates adjustments causing inflation.

With mark up pricing at the start of the period as the norm, each firm gets a share of its produce as the gross profit. These when aggregated over all the firms lead to an expected share of profits in the national income. For the *ex ante* mechanism for the formation of share of wages in the national income, it was suggested in Kumar (1983) that the phenomenon of leading sector wage bargaining may be considered. Conflict then becomes very sharp, specially in the technologically lagging industries.[15]

Conflict Model in Indian Context

In the Indian case, a conflict model of the Rowthorn or the Kalecki type will not hold due to the existence of a large section of labour which is unorganised and unable even to bargain for maintaining a fixed real wage. It would certainly not be able to enforce for itself a fixed share of the produce. Thus, the mechanism for wage share formation suggested above would not hold even if it could be taken to hold for the organised sector. The unorganised sector only gets the residual incomes left by the organised sector [Kumar, 1983 and 1986].[16]

In other words, due to the existence of the unorganised sector, a conflict started by any shock can get resolved through adjustments at the expense of the share of incomes of the unorganised sectors. This results in rising disparities and growth is marginalising.

In contrast to this scenario, Lewis's model of development suggested that the expanding modern sector would draw in labour from the backward one without increasing disparities. This vision is not being realised. In the Indian growth context, the unorganised backward sectors are being left farther behind. If employment were to rise in the unorganised sectors it would further depress the wage rates there [Kumar, 1988b].

Today, shares in the national income depend not only on the wage bargaining and the price setting processes but also on government policies. The various economic interests in society have realised this. For example, a tax on wages reduces the share of the workers in the national pie by reducing their post tax incomes. On the other hand, if the expenditures out of the taxes go to improve their welfare, they are no worse off. Thus, *conflict takes place over government policies which effect the shares that different sections of society expect to receive.*

The growing conflict is also a major cause of the wasteful (and inefficient) role the government plays in the economy. It leads to the fiscal crisis of the state which in turn limits the role the state can play in mediating the conflict amongst the major actors by providing them additional benefits. The reason is that conflict generates demands on public resources in ways such as to diminish government's capacity to intervene in the economy in other more resource creating ways.

In a situation of heightened conflict amongst themselves, the individual ruling groups seek other allies and organise and politicise groups which till then were peripheral, including drawing support from some of the groups which face deprivation. In the rural areas, the rich farmer is seeking the middle and the poor peasants as allies and mobilising them against the more prosperous urban elites.

Finally, some of the emerging groups which were outside the ruling circles have found that they need to get organised to gain a share of the national pie. The rapid social change in India is also throwing up new groups which have the capacity to organise themselves. This aggravates conflict further through accentuated intra ruling group conflicts.

The residual groups completely left out are squeezed even more and face growing economic crisis. This adds further to the social tensions, to expenditures by the state and the need of the marginal groups to organise themselves or be organised by others. There is then a coincidence of the need of these groups to get organised and the desire of the dominant groups to gain new allies. Such mobilisation has been on the lines of the traditional divisions in society—caste, community, etc. Partly, this represents the weakness of the Left forces in the country. They have neither been able to mobilise the deprived on secular issues nor prevent their leadership from being taken over by the vested interests.

This intra class conflict amongst the ruling economic interests also manifests itself in the inability of the ruling groups to articulate clear cut goals. They are unable to evolve stable alliances amongst themselves. It shows up in the decline and the fragmentation of the centrist political parties in India and the inability of the ruling groups to work for their long-term interests.

In a nutshell, the sharpening conflict amongst the ruling groups in India and their inability to resove their differences without imposing greater and greater burdens on the state is both a manifestation of the growing crisis and also the cause. Such conflict limits

the opportunities for the ruling groups and heightens the conflict amongst them.[17]

Growing Conflict and Unorganised Sector

Inflation has resulted in an increasing share of the national income accruing to the propertied classes and to organised groups. The adjustment in such a conflict situation has taken place at the expense of the unorganised sectors (also in Holzman, 1950). The question is does this process have a limit?

What prevents the share of the unorganised from falling to zero? The possible floor may be the subsistence requirement. This is not a given fixed basket of goods or its monetary equivalent. It is determined by the social norms and the economic conditions. It can also be squeezed from time to time as conflict aggravates but may recover over time.

With inflation, a rising level of money income would be required for a given subsistence basket of goods. More importantly, to earn a given minimum basket of goods other expenditures are necessary. For instance, to sustain employment more of travel may be necessary. This is a result of the changing job markets. Large numbers of people are being displaced from traditional jobs and homes. Free gifts of nature have disappeared. Thus, even to earn the income to obtain 2,200 K Cal more has to be earned. New jobs pose new challenges like, changing lifestyle, health hazards and entertainment. These require more money incomes.

In this context income differentials between the urban and the rural poor do not necessarily reflect differences in standards of living. The former need a higher income for the same subsistence. *The unorganised are faced with a squeeze from above (organised sectors) and a squeeze from below (the rising consumption basket for a given consumption basket).* They need a rising share of the national income and not just a given real income obtained through an inflation linked rising money wage. This is raising the level of social tensions and conflict.

Limitations on Manoeuvrability of State Activity

Inflation as the reason for a limit on state activity is not a convincing explanation since, government in the conflict models of the above kind is not a neutral agent. It is seen to act in the interest of the dominant ruling classes, like, creating a growing market for the capitalist classes by desiring to raise its intervention in the economy.

Then, why shoud the government be sensitive to the process of inflation which would raise the share of the propertied classes even further? Inflation does more of the same that the government is not averse to—acquiescing in a rising share of surplus in national income. In a conflict model of the Rowthorn kind, government ought not to be averse to inflation? The money illusion argument is not convincing. As has been pointed out, a rising share of the propertied classes is consistent with a given real wage rate of the organised sector workers. If productivity changes are allowed in the model, the task is even more easy.

An alternative reason for the persistence of the deficiency of demand and government's inability to intervene even more in the economy has been explored and presented in [Kumar, 1988a]. It is based on the rising share of the propertied incomes (surplus) in the national income due to the rising share of the black economy and the services sector.

The share of surplus in the economy is rising faster than government intervention in the economy. It has also been argued that forms of intervention available to the government given the structure of the ruling classes and its dispensation also raise the share of surplus in the economy. Thus, the deficiency of demand persists in spite of (and because of) the rising level of government intervention. The rising share of the surplus also depends on the changes in technology, as discussed earlier.

The increasing fiscal crisis leads to a reduced manoeuvrability of the state. As discussed in the earlier sections, it leads to granting of more and more concessions to vested interests (both in the country and outside). The state is involved in gathering resources only to recirculate them to the propertied. This *reduces the net resources with the state to step up its rate of intervention in the economy.*

In conclusion, it is not the fear of impending inflation which limits state intervention. The limit is a result of the forms of intervention the government is willing to use and the conflict it is mediating.

VI
Changing Role of State and Economy

The discussion above suggests that there is a need for a growing state intervention in the Indian economy. The deficiency of demand in the economy needs an external market. The possible solution internal to the dynamics of the capitalist sector, based on an expanding export market, is infeasible given the present weak technological base in the country. Imitation of the 'late late industrialisers' requires strong state intervention and the curbing of the democratic structures in the economy. The process then is not internal to the dynamics of capitalist sector (if that is what is implied by the 'free market' solutions) and requires strong state intervention.

For the reasons discussed earlier (also see Kumar, forthcoming) to be able to be export competitive, India needs access to technology. But this invariably implies political and economic costs. If India is to pursue its democratic structure and political independence, then these costs may not always be acceptable.[18] As such, exports as an option for expanding the markets in a major way is not viable.

The capitalist sector can also grow by eating into the precapitalist sectors. This has limitations in the current context since it leads to growing social tensions and increasing oppression by the state (resulting in rising consumption expenditures of the government). In turn, this limits the government's capacity to intervene in the economy.

In other words, for accelerating growth, *both the routes that are, at least theoretically, considered to be endogenous to the dynamics of the capitalist sector, not only require strong government intervention in the economy but would also (and are doing so to the extent they are being attempted in India) not prevent a growing crisis. They also require the state to turn more authoritarian.*

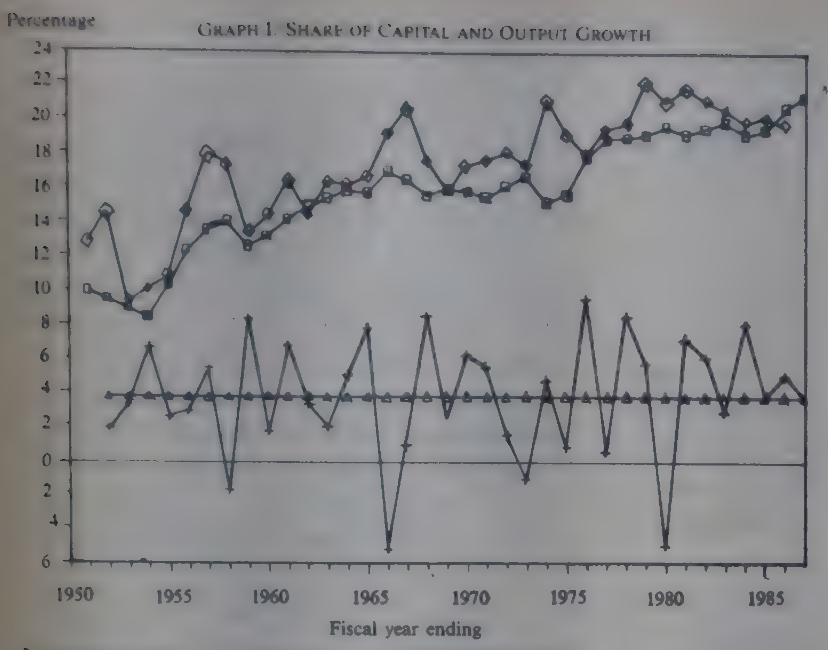
State intervention then appears necessary. The third option of direct and open intervention in expanding the markets for the private sector seems to offer the best possibility. However, this is also hemmed in by some of the consequences already discussed and observed in India. Government intervention accompanied by growing economic disparities has its limits. *It must not simply do more of that which the private sector does.* Its policies must be differently structured.

Greater government intervention in directions hitherto unexplored is needed. Capitalists would have to give up their fear of full employment.[19] The fiscal crisis which limits the state's capacity to work for the long-term interest of the ruling groups needs to be overcome. The model suggested that in the short run, the increased state expenditures reduce the extent of the deficiency of demand. But, the inability to raise investments consistent with the requirements of technology produce low rates of growth. This realisation amongst the ruling groups is necessary for changing the focus of government intervention.

The discrediting of government intervention in the economy as being inefficient is also responsible for its inability to step up the rate of intervention to eliminate the deficiency of demand. An ideological climate against state intervention in the economy has been created. However, the alternatives also depend on state intervention in the economy. Thus, *the question is not whether there should be state intervention but in what form and how much?*

Import of technology for the purpose of utilising scale economies in production which lead to a rising output per unit of labour and an expansion in the share of surplus, need to be regulated such that the resulting surplus is ploughed back into the economy. This requires state control of the import of such technology. The resulting surpluses couid be invested. The high output per unit of labour in the advanced sector can then be used to generate employment to absorb the labour being displaced from the more backward sectors. In the model, 'a' which is inevitably raised by imports of technology is lowered by the government intervention.

GRAPH I: SHARE OF CAPITAL AND OUTPUT GROWTH



Source: National Account Statistics.

GRAPH II: IMPORTS AS SHARE OF GDP

For a larger investment programme of the government, to close the deflationary gap, the growing surplus in the private sector would have to be tapped through forcing tax compliance, i e, curbing the growing black economy. Thus, the resources for employment creation can be obtained through tax effort, reducing wasteful state expenditures in unproductive activities and generation of surplus through use of advanced technology.

The state with control over technology and the resources released by the above strategy could also embark on an export drive. Technology could become available to the state cheaper than to the private sector. It would have greater bargaining power *vis-a-vis* the owners of technology than the individual capitalists can have.

Technology which under the present market system is a source of increasing disparities can be used to reverse the trend. The key questions are who would control the surplus emerging from the advanced technology and how it is utilised? It is on these that the results hinge.

All this goes against the grain of the present trends of liberalisation and restricting the role of the state. A more explicit policy of state intervention is being advocated here. This would help enlarge the market directly through government investments, through enlargement of the export market and the expansion through the absorption (and not just destruction) of the precapitalist sectors. These would promote greater growth, reduced disparities in the economy and reduced social tensions.

VII

Conclusions: Growing Confusion and Crisis

The overall thrust of the 1989-90 budget is populist. Actually, it indicates an incapacity on the part of the government (and the ruling classes it represents) to take the steps necessary to break out of the low growth trap the economy finds itself in (see Graph I). The fiscal crisis facing the government and limiting its capacity to intervene in the economy remains unchecked.

Efforts at creating employment are too little in comparison to the needs. Little dent is likely to be made on raising resources through the taxation of services. Technology is unlikely to 'take off' to raise 'efficiency' or reduce costs to make Indian goods export competitive. The capital goods sector is likely to face greater difficulties.

The fiscal crisis which is at the back of the growing budgetary constraints in spite of an improved economic situation is not recognised for what it is. The conflict between the groups represented in the power structure is becoming sharper. It limits the forms in which revenue can be raised while increasing the draft on the state's resources. Attempts at taxing services rather than attacking the situation head on by raising direct taxes is in line with this analysis. Shift of borrowing from the budget to the much more expensive (from the point of view of taxes foregone and the interest to be paid) device of direct borrowings by the public sector undertakings is another example.

Similar confusion in policy is also manifest on the critical front of technology. Liberal imports of inessential goods is being allowed in newer areas (food processing and packaging) while the screw driver technology already operating in the country is sought to be curbed. Investments already made would be adversely affected. The view that in India, investments in development and absorption of new technology is risky is reinforced. The new technology being introduced in food processing would raise prices of food items and affect the poorest the most. A tightening of screws on the indigenous capital goods sector by lowering import duties while raising the excise duties on inputs for capital goods is going to have a similar impact on indigenous technology.[20]

The reaction to the growing fiscal crisis has been to suggest limiting the role of state by cutting back on the areas of state intervention. The private sector has been expected to step in to fill the gap. The growth was initially expected to come from consumer durables and luxury goods. The demand growth for these items has been high given the trend for the shift of national incomes in favour of the propertied classes. This demand has been further stimulated by the availability of lease financing. High value added food items are now being added to the list.

A rapid adoption of this strategy has necessitated import of technology. The indigenous industry which could have developed much of this technology was neither allowed the time nor was it inclined to invest in such technology given the past experience of uncertain returns due to rapid shifts in policy and the small indigenous demand base for many of these products. In the model, this would raise 'a' and 'f' and lower 'b' and aggravate the instability in the economy.

The build up of imports has necessitated both external commercial borrowing and step up in exports. This has deepened the fiscal crisis as well as brought in the argument of 'efficiency' and cost cutting for exports. This necessitated more import of technology. Imports as a share of GDP has risen since the sixties (Graph II). It had fallen till the end of the Sixties. The impact of fiscal policy on costs and efficiency as judged by border prices in relation to internal prices has been ignored.

In this context, for a step up in private investments, in spite of stagnant public investments, the need for more incentives to the private sector becomes necessary. Arguments for liberalisation of policies, internal and external have followed. What has not been appreciated is that the move for more incentives accentuates the shift in national income in favour of the propertied classes. In the model, 'f' rises. The need for state intervention to keep demand growing then rises rather than falls.

The import of technology which today has a high output to labour ratio aggravates the situation further. As the model presented indicates the need for government intervention to overcome instabilities and to maintain high growth rates would rise even further. Much of the new electronics and computer based technology in production has a high output to labour coefficient. The labour processes are being reversed. Instead of subdivi-

sion of tasks to more specialised ones which could be performed repetitively by labour, a reverse process is taking place.[21]

With the rise in the output labour ratio and private control over such technology, the tendency for control of surplus in fewer hands and growth in deficiency of demand is likely to get aggravated. This is where the role of the state in countering this tendency by enlarging the internal market is growing.

The role of the state in providing the requisite environment for R and D needs to be recognised. As argued in Kumar (1987a), India has to accept that on its own it will not be able to compete with the advanced nations in high technology. Yet, for maintaining its political independence, it has no option but to maintain presence in these areas while accepting a growing technological lag *vis-a-vis* the advanced nations.

The nature of the public sector in this environment must also undergo a transformation. It must actually take hold of the commanding heights of the economy. Since with changes in technology, the heights are not given for all times, it must also shift the areas it commands. Lower levels of technology may be left to the private sector. The objective should be to see that the surplus in the economy is recirculated in the economy to maintain exployment and demand. Another area for the public sector could be the provision of support to the small scale sector, specially in marketing and finance. The small scale sector may then be the source of dispersed employment in those areas of production which do not show scale economies.

This policy needs to be supplemented by fiscal policy and administered price policy. A shift in favour of direct taxes is called for. Indirect taxes and borrowing at rising interest rates need to be curtailed. Administered prices need to be fixed such that the surplus does not slip out of the public domain to private hands. The budget proposals for 1989-90 do not make the required break from the past pattern in spite of the initiatives (which are cosmetic) which are being praised by many.

Appendix

The model presented in the text, to study the interlinkage between technology, investment and the deficiency of demand consists of three linear, first order coupled differential equations. The particular form used is dependent on the assumptions incorporated. These were briefly spelt out in the text.

The form of the equations determines the results and is explored in greater detail. First, in Domar (1946) it is suggested that the rate of change of full employment productive capacity depends on the level of investment. The productive capacity depends on the rate of growth of supply of labour and the output per unit of labour (β).

For a given rate of growth of labour supply, the rate of change of β then depends on the level of investment, ϕ. Even at a given ϕ, β rises as new technology is incorporated in machines. Disembodied technical change would show up as a rise in β independent of ϕ. Hence, $d\beta/dt$ may be taken to be a linear function of ϕ. However, ϕ itself depends on β. This is not incorporated in Domar (1946).

Kalecki (1971) suggested that investment decisions per unit of time depend on the level of savings, the change in the rate of profit and on technology (as a long-term factor). Investment decisions result in deliveries of equipment after a time lag which depends on the construction period of equipment. If this time lag is assumed to be a constant and taken to be zero for simplicity then the rate of change of investment (deliveries) depends on the factors listed above.

The level of savings depend on the level of incomes which depend on the level of investment itself, ϕ in the model. This term may be thought of as an accelerator or self excitement of investments. The rising capital stock tends to lower the level of capacity utilisation in the economy and that is sought to be captured in this model through the effect of σ on lowering ϕ. Lower capacity utilisation also reflects itself in the decline in profits. The long-term dependence of ϕ on technology is captured through β. In effect, change in the investment (relative to the capital stock) is a function of ϕ, β and σ. Investment goes on in spite of possible excess capacity in the system due to technical change. This would be ruled out if the accelerator mechanism alone determined ϕ.

In this model, the variable ϕ is defined as investment/capital stock since the absolute amount of investment is in relation to the size of the economy or the existing capital stock. So a bigger economy for the same values of β and σ would have a larger investment than a smaller one. It needs to be noted that ϕ is the rate of growth of capital stock.

Thus, $d(I/K)/dt = (I/K).\ (dI/dt)\text{-}\ I^2/K^2$.

The deflationary gap in this model is taken to be a ratio of the level of output 'O' in the economy. The gap 'G' is the amount by which the actual output falls short of the full employment level of output. That is,

σ = Deflationary gap (G)/Output level (O).
σ [β. L_f − O]/O, where L_f is the available labour supply.

Using the multiplier, $O(t) = I(t)/s(t)$, where $s(t)$ is the savings propensity at a point of time.

$d\sigma/dt$ is then a function of $d\beta/dt$, dI/dt, ds/dt and the rate of growth of labour supply, say a constant, n. As argued earlier, the savings propensity changes with the rising share of the property incomes and would follow the changes in ϕ. Substituting for $d\beta/dt$ and $d\phi/dt$ in terms of β, ϕ and σ, and ignoring the non linear terms, $d\sigma/dt$ becomes a function of β, σ and ϕ. The coefficient of ϕ is likely to be small and is taken to be zero. This term appeared in the equation from the $d\phi/dt$ term. It may then be best left as exerting an influence on ϕ through the term containing ϕ. On *a priori* grounds, σ must decline with ϕ and rise with β. This is the form of $d\sigma/dt$ used in the model.

These are the assumptions behind the form of the equations used in the text.

The solution to the equations is obtained by solving the characteristic equation which is a cubic in Ω. However, it is simpler to look at the solutions graphically by rewriting the equation as $F(\Omega) - G(\Omega)$, where $F(\Omega) = \Omega^3$ and $G(\Omega) = c.\ \Omega^2 + \Omega.\ (ab + eg) - aef$.

The intersections of F and G give the required roots.

$F(\Omega) - G(\Omega)$ has a maximum for $\Omega < 0$ a
a minimum for $\Omega > 0$. At $\Omega = 0$, it equals
> 0. It also rises $-\infty$ to $+\infty$ as Ω goes fr

there will be one negative root say, Ω_1.
$\Sigma\,\Omega_i = c \geqslant 0$. Thus, $\Omega_2 + \Omega_3 = c - \Omega_1 \geqslant$
Also, $\Omega_2 \cdot \Omega_3 \cdot \Omega_1 = -\,aef < 0$. Thus, Ω_2
$= aef/\Omega_1 \geqslant 0$.
Thus, if Ω_2 and Ω_3 are real, they must be
the same sign, in this case, positive. If they a
imaginary, then the real part must be positiv
Whether the roots will be real or imagina
would depend on whether aef, the intercept
the function G is near the origin or far fro
it. If aef is small, then there is a chance th
the intersection of F and G would occur in t
region $\Omega > 0$. This would correspond to the re
root case. Otherwise, the roots would
imaginary.

The constant terms which should have o
curred in the equations and which have bee
ignored make the equations non homogeneou
The particular solution corresponding to the
would give a linear time trend in the solution
This can be ignored in relation to the exponen
tial trends obtained from the homogeneou
part.

The negative root makes β, ϕ and σ decay t
zero as $t \to \infty$. With all the roots real, the solu
tion for β, σ and ϕ would asymptotically go a
the exponential of the largest root. In this cas
since they occur for aef small, the intersectio
of $F(\Omega)$ and $G(\Omega)$ occurs near the origin. Th
roots are then all of small magnitude. Large
are 'c', 'b' and 'g' for a given 'a' and 'e' large
is the absolute value of the roots. Hence highe
would be the exponential rate of growth of th
economy.

With imaginary roots case, the solution
would set up oscillations with growin
amplitude. This is the instability around th
growing linear time trend (from the particula
solution). To overcome this oscillatory tren
there is a need for an external market. This, b
lowering aef reduces the case to the real root
one and the economy can experience stead
growth.

The best policy would be to hold $\sigma = 0$ a
all times. That is, $\sigma = 0$ and $d\sigma/dt = 0$. No
deflationary gap appears and the economy ex-
periences its maximum possible growth rate.
This requires policy to make $\phi = f\beta/g$. Then,
$\phi m = \exp\{t(c + bg/f)\}$ and β also grows a
the same exponential rate. This rate of growth
is certainly larger than the linear trend in the
oscillatory case. The extent of intervention re-
quired is the gap between ϕ as obtained without
intervention and the value of ϕm obtained
above. Intervention is then required to grow
exponentially.

However, an exponential growth in ϕ implies
that the rate of growth of the capital stock is
rising and tending to ∞. Whereas, β and σ can
grow without limit, to ∞, as suggested in the
text, ϕ has an upper limit. At best the entire
output of the economy can be the investment
goods. If Γ is the output capital ratio in the
economy, this is the maximum value that ϕ can
take. This is also not feasible since some pro-

uction of consumption goods is always re-uired so $\phi \leqslant \Gamma$.

An upper limit to ϕ needs to be accepted in he model. this is referred to as the ceiling. This eiling is not the same as in the business cycle nodels, say, of Hicks. There it is the maximum ate of growth of output and is not a result of he shortage of capital but related to the supp-y of labour. Here it is a result of shortage of apital to produce more and more of investment goods.

To grow along the ceiling, $\phi = \hat{\Gamma}$, i e, a con-tant less than Γ. Then, capital stock grows at he exponential rate of $\hat{\Gamma}$ and so does invest-nent and, through the multiplier, the level of output. This is not the same rate as the growth of labour supply, n. Full employment output grows at the rate of growth of $\beta + n$. So the savings propensity in the economy must adjust at the rate $\hat{\Gamma} - d\beta/dt - n$.

As the rise in ϕ forces a larger and larger pro-duction of investment goods in relation to the output, the savings propensity in the economy must rise. If the growth of the share of invest-ment is at the expense of wages, i e, forced sav-ings, then, the model has inflationary implica-tions. This would be true even below full employment.

The implication is that if the government holds the economy at the ceiling by raising in-vestments there has to be a shift in national in-come in favour of profits. In a conflict situa-tion, this raises the level of conflict. However, if the government holds down the rise in level of employment to below n, then the rise in the savings propensity has to be even larger $\hat{\Gamma} - d\beta/dt - n$ to maintain the economy at the ceil-ing rate. Unemployment aggravates inflation and conflict. The economy would manifest a tendency for stagflation. The least inflationary situation would be the one with full employment.

This is the kind of fear that may impel the government to hold back its intervention in the economy to keep it growing at less than the ceil-ing rate. A lowering of the ceiling below $\hat{\Gamma}$ is needed such that it equals $d\beta/dt + n$. There would be full employment without inflation.

Excess capacity in the capital goods sector would *tend* to appear. This would exert a downward pressure on ϕ and would require growing intervention. No capitalist economy may then be observed to be growing at the ceil-ing rate since it involves a rapid build up of con-flict between wage and profit shares. Different levels of government intervention do not lead to different ceiling rates of growth, they need to be obtained through structural re-adjustments. Then the ceiling rate of growth may be maintained through constantly rising intervention. Thus, two forms of intervention are required for steady growth without inflation.

Any let up in employment, at the ceiling, would immediately kick off inflation. If an unorganised sector exists in the economy, as in India, the adjustment would be at its expense. The extent of rise in he savings propensity re-quired would give the amount of loss of share that the unorganised sector would have to accept.

Finally, the model allows one to draw im-plications of rising imports or a growing small scale sector. These can be obtained by doing comparative statics. Rising share of imports would raise σ and $d\beta/dt$ for a given ϕ. It would raise 'a' and lower 'g'. The economy would move towards the oscillatory case or oscillations would become larger.

The existence of a small scale sector lower 'a' and raises 'g' the effect of ϕ on σ. The wage share being higher, the gap σ reduces faster with a rise in ϕ. These reduce the oscillations in the economy and is the exact opposite of the case of rising share of imports. In the Indian economy, the share of the small scale sector is falling [Kumar, 1982c] and the share of imports is rising (Graph II). Thus, instability without a step up in the growth rate persists in spite of a larger share of GDCF and GFCF in the economy (Graph I).

To conclude, the implications of the model are that questions relating to technology, invest-ment and employment need to be studied together. In the past, they have often been in-dependently studied as in Kalecki (1971) or Rowthorn (1977). Of course, the form of equa-tions used may be different from the ones used in the model above. Different kinds of results may then be generated.

The institutional details of the eocnomic rela-tionships would determine the exact form. For instance, the investment function used here makes sense in an economy where the investors and the savers are different people. The extent of existence of the precapitalist sectors may change the sensitivity of the coefficients used. Incorporation of the black economy may also change the equations. The nature of the state whether it is sensitive to inflation or to employ-ment is another factor which would influence the form of the equations and the coefficients. These are not explicitly incorporated in the model but are there.

Notes

[I would like to thank Deepak Nayyar for pro-viding me with data on imports.]

1 Agricultural prices have been rising through 1988-89, in spite of the excellent monsoon and the expected bumper harvest. Policy-makers need to be wary of this. This rise may be a result of the depletion of private food stocks last year and their replenish-ment this year. Incomes in rural areas have grown this year and so must have demand for food. These two factors could have reduced the surpluses for the urban areas. Government's stocks are also depleted and unable to exercise a restraining influence on food prices, as they did last year.

2 Some other items also do not seem to lie on the trend of the past budgets and show unusual departures and may have been used to dress up the budget to make it read bet-ter. For instance, under disbursements, items Capital Account of Industry and Minerals and Fiscal Services are lower than even the revised estimates for 1988-89. In the Public Accounts, the Deposits and Advances have sharply declined. Supplementary demands at a later date can be used to accommodate larger expenditures where they have now been underestimated.

3 If the current salary is X, the annual incre-ment, a, the rate of interest on PF, r, then the number of years at the end of which the PF income is the same as the current income is given by:

$$N = [\ln\{6X + X(1 + r) - a(1 + r)^2\} - \ln(1 + r) - \ln(X - aN)]/\ln(1 + r).$$

For someone at the top of his grade in government, getting Rs 7,000 per month, at the end of 30 years of service and hav-ing an annual increment of Rs 1,200 throughout the income from PF would turn out to be Rs 2,53,011 per annum in the 31st year. *This is indicative.* A more qcomplicated calculation is possible by in-troducing inflation, etc.

Such concessions are the reason for the sluggish growth of tax revenue. It does not even add up to the rise in prices plus the real growth rate of the economy. In prac-tice, due to the progressivity of the tax struc-ture, the rise should have been greater (Kumar, 1988b).

4 Kalecki (1971) suggested a tax on capital as an ideal form of raising resources (see Kumar, 1988b). This falls on the gross pro-fits of the capitalists and does not raise prices. Capital costs are also high in the Indian context due to the existence of the black economy. Over invoicing of machi-nery purchases, etc, is practised in setting up projects. These costs are also raised by the political nature of the investment deci-sions, specially, in the case of the public sec-tor. Location, source of technology and availability of finance are all influenced by political decisions.

5 In the case of fertiliser industry, it is being suggested that Indian fertiliser production is inherently inefficient and high cost, so it be allowed to relocate in the Middle East. This proposition has not been demonstrated with the cost of gas and other inputs scaled to international prices. Capital costs also need to be comparable. Import duties and imposts and costs of delays need to be fac-tored out. If this is done and costs found competitive and the country found to have the requisite amount of gas, there is no reason not to create employment in India. Today, gas is being flared, fertilisers im-ported and its shortage expected to grow in the coming years. For strategic reasons also, location of production at home may be better.

6 Even in the case of the manufacturing sec-tor, black incomes are generated through trade channels, etc, (Kumar, 1988a).

7 Investments in real estate do not represent real additions to investment. Fund owners waiting for the right opportunity outside this nexus only lower the velocity of circula-tion of money in relation to the output. The consequence is a slow down in private investment.

8 Public sector employees' rising per capita emoluments is not a reflection of the rising real incomes. In fact, income indexation to inflation has only been partial, specially, if rent paid is taken into account. The observ-ed facts can be due to changes in producti-vity and age profile of employment. Employ-ment in the public sector has grown at higher levels of skills. Also, after their rapid expansion, the age profile of employment must have shifted in favour of the older and better paid groups. Both these reasons would raise the per capita emoluments and partly explain the rising contribution of government to the services sector.

It is interesting that in the case of the private sector it is the lack of incentive to make high profits that is seen to hold back its growth while in the case of the public sector it is the high emoluments that are seen to be the culprits in not spurring the workers to produce. The logic of incentive is faulty since in monetary terms, there is always a higher level of income that could be sought. If not available, it could be a disincentive. One has to run to stay still. Income disparities are themselves a source of dissatisfaction with one's income level and a cause for seeking a monetary incentive.

9 The expenditures out of surplus may also be on overheads. This could rise with changing technology and higher payments to managers, etc. However, these are unlikely to absorb a higher proportion of the surplus generated since this technological change would then not be desirable for the capitalists.

10 In the case of electronics industry, a rapid technological change has led to a cheapening of goods in real terms. However, in general, much of the new technology is in the control of the transnationals who use it to expand their margins rather than to cheapen products. For example, in the case of pharmaceuticals and drugs. In some cases, they may allow a temporary cheapening to capture a market. Where increased competition amongst the transnationals exists, it has taken the shape not of price reductions but of increased expenditures on advertisement, etc. That is, of a rise of the services component per unit of material goods production.

11 Technology does not benefit all sections uniformly. It can harm some, like those it forces into unemployment. It may make the system as a whole more inefficient. This is where the role of the government is important. International trade also has similar effects.

12 See Graph I. It shows that in spite of a rising share of the GDCF, the annual growth rate of GDP has simply fluctuated around an average figure of 3.9 per cent. Some rise in the GDP growth rate in recent times is a result of the rising statistical weight of the services sector. A rise in the rate of growth of secondary sector is unclear (Kumar, 1987c).

13 The obvious examples are of professionals (doctors, lawyers, teachers, etc) giving up their own age old ethics in favour of sharp practices. The resulting contradictions are there to see. For instance, civil rights lawyers can be seen representing the case against the Bhopal gas victims, the result of the worst ever industrial disaster. They also stoutly defend the moneyed in all the white collar crimes without seeing any contradictions. This is justified on the grounds of 'not guilty unless proven so'. Doctors make their patients run around from expert to expert to make money. Teachers teach indifferently to obtain tuition, Chartered Accountants sign on the dotted line and white wash business wrongs.

14 If a firm does not raise prices by more than the average, it would not be able to raise its share in the national income since others (capitalists and workers) would also react and raise prices and wages. A firm which consistently raises prices by more than the average would run into difficulties with regard to maintaining its market shares. As such, this cannot be the manner in which a firm can raise its share in the national income; technological edge becomes critical.

15 In the technologically lagging industries, the leading sector wage bargaining would imply a decline in the share of profits. Another consequence of such a conflict would be that any industry accepting a price reduction would actually lose its share in the national pie if others do not lower their prices too or the workers do not accept a lower share. Thus, technological dynamism would not reflect in price fall and conflict would aggravate.

As production gets more and more concentrated in larger firms with a higher degree of monopoly, the degree of monopoly in the economy would rise. Over time, the expected share of profits in the economy would rise and lead to the accentuation of conflict.

Degree of capacity utilisation in industry would affect the level of conflict. When it is low, overheads per unit of output are high and the capitalists need higher profit margins to cover them. Thus, the capitalists may be satisfied with a lower share of the output as the economy approaches full employment leading to a reduction in conflict.

However, using the Phillips curve kind of argument, some argue that the workers demand higher money wage increases near full employment since their bargaining power rises. This would aggravate conflict as the economy approaches full employment. This does not follow. A higher money wage could result if labour shifts to higher productivity jobs and continues to obtain a given share of the rising output. In other words, the faster increase in money wages near full employment may be due to rising productivity rather than conflict.

16 Thus, any conflict over shares in the national income would be short lived and would peter out. Indeed, inflations in the Indian economy have had a short duration with a sharp rise and then a tapering off.

17 There is another aspect of the growing Fiscal Crisis in the Indian context. Centre-state relations have sharply deteriorated. The centre has concentrated economic, political and social power in its hands. It has used this to play politics by flexing its financial muscle. This provides an opportunity to regional elites to lay the blame for relative deprivation on the centre. Opposition governments in the states have mobilised opinion to fight the manipulations by the centre. In certain states, the centralisation of power was seen to smother local aspirations or hurt regional pride and led to a reinforcement of regionalism. Coming on top of the uneven regional growth which is a part of capitalist dynamics, it diverts attention from the economic dimensions of disparities to political and social factors.

It is worth noting that differentiation also has regional dimensions in addition to what has been already discussed in the context of conflict. Slow growth with some states having done much better than others has led to this.

18 Recent examples of arm twisting are concessions sought on behalf of the transnationals for opening Indian markets to them, change in the stand on intellectual property rights and patents, etc. These have possibly been a *quid pro quo* for supply of some technology in aero space, electronics, computers, etc, to India.

19 Business and consequently government dislike full employment for reasons other than inflation. The private sector tends to lose control over economic policy if the economy operates at full employment. If government intervention is disallowed, the capitalists gain an advantage *vis-a-vis* the rest of the society in the form of demanding and obtaining concessions to keep the economy going at a higher level of economic activity. If the economy is already near full employment, no concessions need be given to the capitalists (Kalecki, 1971).

Another reason why capitalists may not like full employment is their capacity to keep the organised sector workers under check declines. The workers could demand an increase in their share instead of being content with maintaining their share. Capitalists also fear a growing public sector which limits their area of activity and potentially threatens their profits.

State intervention in the economy can take the form of rising administrative expenditures but that aggravates the fiscal crisis. If it takes the form of rising public investment, then the sectors where such investment goes become less profitable for the private sector (Kalecki, 1971). However, in the Indian context, the areas of operation of the two sectors were clearly demarcated. The private sector learnt how to use the situation to its advantage by absorbing a large part of the surplus resulting from the public sector.

20 Policy makers in India need political guidelines to formulate a clear Science and Technology Policy. This is absent since neither the ruling groups have a consensus on what they want nor do they have a clear understanding of the direction that technological development is taking. The latter may be more easily corrected by setting up advisory groups but even in this respect, policy is deficient. Due to absence of consensus, there are rapid shifts in policy, depending on the pressures from the vested interests. It then appears as contradictory and *ad hoc*.

These confusions are also reflected in the nation's inability to accept that it cannot catch up with the advanced nations in the near future and would have to accept technological backwardness. This may require the country to maintain its present low level of economic exposure to the rest of the world. This may help the country to catch up sooner than through the current policy of opening out. Leap frogging has to be controlled and not blind.

Today, lower level technologies may be available without many strings attached and if rapidly absorbed, could lead to the conditions for advancement in high technology as well. A rapid opening out may kill the indigenous capability to absorb and develop technology.

The current debate on patents and in-

tellectual property rights shows India's backwardness even in the lower level technologies. India is not capable of competing in high technology and poses no threat to the advanced nations. It is in the lower level technologies that the advanaced nations are willing to relinquish control to the third world nations that the question of patents assumes importance. The advanced nations would like to get a continuing return even in these areas.

21 These trends of rising output per unit of labour are likely to be further accentuated by two major recent developments. One is the possibility of high temperature superconductivity and the other is the likelihood of room temperature fusion reacton. The first would allow more efficient use of energy while the second would make energy very cheap. Consequently, with new machines, labour substitution would reach qualitatively new levels.

The Chinese Tragedy: Roots and Offshoots

Ajit Roy

The tragic events in Beijing have given rise in the main to two contradictory tendencies among critics, both having the common characteristic of being totally utopian: one of these looking forward to change of the country's course towards a sort of bourgeois democracy and the other urging a return to Mao Zedong's prescriptions for a historical short-cut to communism. The only correct path is to work for the present course of socialist modernisation, but shorn of its inadequacies and weaknesses. This rectification is possible only through a closer integration of Marxist ideology with day-to-day practice at every level.

THE recent events in China have stirred the conscience of the world as few things have done in the contemporary history. The reasons for this powerful impact may perhaps be sought mainly in two directions: Firstly, a deep sense of unexpected shock as there was little in the Chinese leadership's responses to the long-drawn crisis to indicate such a bloody culmination, notwithstanding its induction of armed forces into the capital following the proclamation of the martial law. Even more because it had permitted the martial law proclamation to be flouted and defied with impunity for full three weeks. Secondly, because of the world people's direct and immediate involvement with the day-by-day developments, thanks to the recent advances in telecommunication facilities. Another reason for the powerful repercussions of the Chinese events may possibly be the sudden shattering of the image of a wise and thoughtful group that the Chinese leadership had come to acquire in the estimation of the world people during the past decade.

Unquestionably, the Chinese leadership seems to have seriously compromised its standing by its conduct during the entire period of the crisis, even if one for the moment leaves out the question of the responsibility for the origin and development of the crisis—specifically for the following reasons:

(i) Despite the experience of the huge scale of the preceding round of student-youth upsurge in China in the winter of 1986-87, the Chinese leadership failed to estimate carefully and correctly the depth of popular involvement in the Beijing demonstrations this time.

(ii) While till literally the eve of the bloodbath, the leadership continued to acknowledge the patriotic and democratic bona fides of the mobilised masses, with occasional hints of counter-revolutionary intrigues of some dark forces, it initiated no programme either to unmask the dark schemes and the schemers or to retrieve the confidence of the alienated masses.

(iii) Ultimately, when the leadership proclaimed martial law and called out the armed forces, it did so apparently without having done any serious homework. For three weeks it did not seem to know what to do with the armed forces it had summoned to the capital. On the one hand, day after day the armed forces were allowed to be subjected to tremendous public pressures for defiance of the government's commands and for openly siding with the rebellious masses. There were reports of even a section of active and retired army personnel making common cause with the demonstrators. On the other hand, the prime minister went on calling for "powerful measures" to "curb turmoil" and "restore peace", but without having any practical repercussions. Indeed, Li Peng's pronouncements demonstrated serious confusion in the government's thinking. He said that "very few people attempt to create turmoil" and to "overthrow the people's government", while the huge mass of the students "are kind-hearted and do not want to create turmoil", but hope " to promote democracy and overcome corruption", which were "in line with the goals the party and the government" strove to achieve. He did not seem to realise that these statements were directly contradictory with the massive mobilisation of the armed forces, already resorted to by the government.

(iv) Li Peng displayed poor judgment when he superciliously refused to talk with the students' representatives on any substantive questions and, further, did not accept the students' proposal for an open TV debate with them. The government and the party should not have shied away from this opportunity for stating their case openly and convincingly before the entire nation, nay, even the entire world, and win moral and political supremacy, if they could thereby, over its challengers.

(v) As admitted by the government subsequently, it did not have at its disposal sufficient stocks of non-lethal ammunition like tear-gas shells and rubber bullets, even though it had three weeks to spare before it actually undertook the punitive steps. This means that neither had it considered with adequate responsibility the question of the best means of meeting the developing situation with the least possible violence, nor did it really seem to care about the scale of violence it would eventually resort to.

(vi) While the exact number of persons killed and injured may not be known for some time, it was ridiculous for the government to come out with the figures it has—300 persons killed, of whom only 23 were students. Because of the patent and palpable falsehood, the Chinese leadership has suffered a tremendous loss of credibility before the world people.

(vii) Even after the bloodbath of June 3 and 4, and after witnessing the extremely unfavourable world reaction, the Chinese leadership did not care to take stock of the situation immediately and to exercise restraints where it could and should have done. As telecasts have revealed, its punitive forces treated the arrested youth with a measure of brutality not permissible for a government professing humanist ideals Moreover, unlike its previous practice, instead of staying the execution of the persons condemned to death, it carried out the sentences immediately.

While the vacillations and hesitations and the lack of clear-cut and confident policies in the first phase of the present crisis may be in part explained by the absence of unity in the topmost leadership, the section which has now acquired the dominant position should not have overlooked the fact that the division in the leadership is itself a reflection of the contradictory aspects in the essence of the developing situation. Hence, its policies and actions will have to be carefully modulated in tune with the complexities of the situation.

Serious Damage

Whether the Chinese leadership realises it or not, whether it cares about it or not, the fact is that the Beijing bloodbath and its aftermath have inflicted very serious damage on the world communist movement as a whole and the cause of world peace and socialism. The progress of glasnost and perestroika in the Soviet Union and the advancing process of humanisation and democratisation of Soviet society associated with them are making great contributions in distinguishing socialism from the Stalinist heritage. The recent events in Beijing on the contrary are helping the reactionary forces the world over to sow doubts again in the minds of the people about the humanist professions of the socialist ideology and the democratic contents of the socialist practice.

The damage to the cause of the ongoing modernisation programmes of the CPC is no less. Its central goal of the socialist modernisation through an updating of science and technology, according to the party's present plans, depends for its success on the willing and enthusiastic involvement of the Chinese intelligentsia and the generous co-operation and collaboration of the advanced capitalist countries. The brutal assaults on the Chinese students and their supporters in Beijing cannot but generate a sullen indifference among the intelligentsia towards the regime and its programmes. The response of China's foreign collaborators, including the Chinese from Hong Kong, also will be less than friendly for quite some time.

The Beijing tragedy had provided a section of Maoists inside China and outside with ammunition to mount attacks on the

CPC leadership's economic plans for socialist modernisation. The Maoists are obviously mistaken. There can be no advance to real socialism without a tremendous development of productive forces in the still quite backward China and for this advance new avenues have to be explored for releasing mass enthusiasm through a certain measure of increase in the opportunities for private gains and personal initiatives. The opening to the outside world also is necessary to gain access to advanced technologies and productive resources. But in pursuing these objectives, the leadership has to be cautious and watchful and has to step up simultaneously measures for keeping the germinating anti-socialist proclivities within strict limits. Hence, the question of the long-term interests of the world communist movement apart, even from the present pragmatic standpoint of the CPC leadership, the recent developments at the Tiananmen Square will surely prove to be exceedingly counter-productive.

The question is: how could the experienced, and so far so cautious, leadership of the CPC land itself in such a pass? To a distant observer, the answer seems to lie in the intellectual and theoretical lethargy that has been marking the Chinese leadership in the recent period. That is, the leadership and more particularly the one who matters most, namely, Deng Xiaoping, while revealing an awareness of the steadily accumulating critical elements as a result of the development process pursued in the country, failed to work out a creative and corrective plan for counteracting them. In one area at least, that is, the issue of mass participation in the decision-making process, Deng clung to an absolutely wrong and even un-Marxist conception. (This we discuss later.) As a result, the negative factors steadily went on gaining ground and ultimately prepared the basis for the catastrophic showdown.

Danger of Capitalist Infiltration

In simpler and concrete terms, Deng always aware of the fact that the socio-economic processes unleashed under the so-called 'socialist modernisation' plans had been generating considerable elements with clearly capitalist orientation in the country's structure and superstructure and that this called for powerful corrective intervention by the leadership. But apart from occasional warnings about the danger of capitalist penetration accompanied by frequent harping on the need for steadfast loyalty to the four so-called cardinal principles which essentially boiled down to submission to the leadership of the CPC, no other meaningful steps were taken to meet the threatened danger of the capitalist infiltration. In other words, apart from the repeated stress on the need for commitment to socialist ideology in the abstract and loyalty to the CPC in practice, nothing was really done to integrate the socialist ideology with the concrete and day-to-day social practice. This position has been quite correctly noted by a Chinese-American academic, David Chang, in his recent book on Deng Xiaoping. He says:

> . . . in China today there exists an ideological void... Nearly every intellectual and moderate politician in China today is reluctant to talk about Marxism or Maoism. People have lost interest in politics and ideology entirely...

Chang then comments with apparent justification:

> Deng's ideological commitment to experimental socialism is unshakable. But he would not allow the need for ideological abstraction to disrupt the need for policy flexibility.

Finally, Chang rightly concludes,

> The current ideological void does not, however, imply an abandonment of Marxism and Mao Zedong Thought. It simply postpones to a proper future time the revision of the ideological front which will be an after-event without failure.

The truth of this commentary may be seen from Deng's own writings and speeches. He was really aware of and worried about the ideological weakening of the party and the people. In his speech to the Second Plenary Session of the 12th Central Committee on October 12, 1983, Deng said:

> Some ...are polluting people's minds with unwholesome ideas, works and performances. In essence, spiritual pollution means the spread of all kinds of corrupt and decadent ideas of the bourgeoisie and other exploiting classes and the spread of distrust of socialism, communism and leadership by the Communist party. The year before last, the

Central Committee convened a forum on problems in the ideological field, at which certain tendencies towards bourgeois liberalisation were criticised. Some results were achieved after that forum, but not all the problems were solved. In some places, leadership remained weak and lax, not all tendencies towards bourgeois liberalisation were overcome and some even grew worse.

In the course of the same speech, Deng said:

> Some of our comrades rush to praise to the skies all trends in philosophy, economics, socio-politics, literature and art of the west, without analysing them, distinguishing the good from the bad or exercising any critical judgment. There has been such confusion in the import of western academic and cultural things that in recent years we have witnessed an influx of books, films, music, dances and audio and video recordings that even in the western countries are regarded as pernicious junk.

Weakened Ideological Moorings

Deng's pontification had little impact on the course of objective development. Three years later he had to admit regretfully:

> With regard to the question of opposing bourgeois liberalisation, I am the one who has talked about it most often and most insistently. Why? First, because there is now a trend of thought—that is, liberalisation—among the masses, especially among the young people. Second, because this trend has found support from the sidelines. For example, there have been some comments from people in Hong Kong and Taiwan, who are all opposed to our Four Cardinal Principles and who think we should introduce the capitalist system lock, stock and barrel...

This was what Deng said on September 28, 1986. Three months later on December 30, 1986, reacting to the large-scale student agitation at the time, Deng said:

> We have to admit that on the ideological and theoretical front both central and local authorities have been weak and have lost ground. They have taken a *laissez-faire* attitude towards bourgeois liberalisation...

With a critical look at the past, Deng bemoaned:

> Originally, I had not intended to say anything at the Sixth Plenary Session of the 12th Central Committee. But later I felt I had to intervene to ask that there be included in the resolution a few words on the necessity of combating bourgeois liberalisation. Apparently my remarks on that occasion had no great effect. I understand they were never disseminated throughout the party.

Indeed, it cannot be denied that Deng always revealed his worries about the weakening of the ideological moorings of the Chinese society. On March 7, 1985, speaking at a conference on Scientific and Technological Work, he said:

> Some people are worried that China might go capitalist. We cannot say that their concern is entirely without reason... At present there are certain phenomena that demand our attention. For example, there is a lack of ideals, as is manifested in the tendency to put money above everything else... During the current economic reform some tricky practices have appeared. There are people who say, 'You have your policies, and I have my ways of getting around them.' Indeed, they have plenty of ways.

While Deng at least revealed an awareness of the possible, if not growing, threat from the right, Zhao Ziyang, and to the extent he represented it, the collective leadership of the CPC tended to underplay this threat. In his report to the 13th Congress of the CPC, held in October 1987, Zhao Ziyang posited an artificial separation between class struggle on the one hand and "the contradiction between the growing material and cultural needs of the people and backward production" on the other. He did not seem to realise that unless consciously and correctly handled, the second contradiction between the growing needs and production could be sought to be resolved in a manner which would not only aggravate the class struggle, but also in the process favour the exploiting classes *vis-a-vis* the exploited.

The barely two-page resolution adopted by the 13th Congress ratifying Zhao Ziyang's report blandly called for "combating interference from the 'left' and 'right', without ever mentioning the fact that the socio-economic programmes pursued by the country will certainly be generating forces favourable to the 'right' orientation.

Most importantly, Zhao's report clearly formulated and supported the unstated premise of Deng Xiaoping's prescriptions, namely, that by merely invoking loyalty to the socialist ideology in the abstract, that is, without a close integration of ideology with social practice, 'right' proclivities could be effectively combated and defeated. Zhao upheld the perspective of "opposing wrong ideology through education, by positive examples and through correct criticism, *instead of through political movements*" (emphasis added).

In the meantime, resentment against the basic, or to use the CPC concept, *cardinal* principle of the people's democratic dictatorship, led by the Communist Party, was steadily building up, particularly among the intelligentsia. The bourgeois liberal Chinese-American academic quoted earlier, David Chang, has noted that the Chinese intelligentsia and average people expected "political equality for all citizens and individuals who shall resist any privileged party seeking to perpetuate class or political power". Reviewing the course of the students' agitation in December 1986, he noted that "The students and a few city workers openly attacked the party dictatorship and held debates and seminars in the streets. The Chinese newspapers abroad echoed the student demands and voiced the 'incompatibility of economic freedom with political dictatorship'..."

Role of Communist Party

Indeed, the most fundamental issue of the present turmoil in China is the role of the Chinese Communist Party. Firstly, there is undoubtedly some truth in the popular perception that elements in the party have developed powerful vested interests in its predominant position in the power- structure which they utilise for their personal aggrandisement. Zhao Ziyang did not mince words in castigating this phenomenon when he said in his report to the 13th Congress of the CPC:

> In the past few years there have been frequent cases of tax evasion, smuggling, trafficking in smuggled goods, bribery, extortion, embezzlement and theft, moral degradation, violation of the law by persons in charge of executing it, divulgence of state secrets and economic information, breach of discipline in dealing with foreigners, favouritism in making appointments and vindictive attacks on others.

These aberrations and the consequent personal stakes of the corrupt cadres of the CPC apart, there are more fundamental and fully justifiable causes of the pre-eminence of the Communist Party in the country's polity. Article 2 of the Constitution of China constitutionally enshrines what may be termed the extra-constitutional position of the party when it lays down that "The Communist Party of China is the core of the leadership of the whole Chinese people".

Deng Xiaoping has been constantly highlighting the supreme importance of preserving the pre-eminent role of the CPC. He has, for instance, said:

> The core of the four cardinal principles is upholding the leadership by the party. We have said many times that without the leadership by the party a big country like China would be torn by strife and incapable of accomplishing anything. Whether inside or outside the party, all tendencies towards weakening, breaking away from, opposing or liquidating the leadership by the party must be criticised... Leadership by the party is the key to the success of the four modernisations and current readjustment.

Further:

> Democracy... without the party's leadership... would only plunge our country once again into anarchy and make it harder to truly democratise the life of the country, develop the economy and raise the people's standard of living.

Some academic experts on China in India have raised the bogey of a possible rise of 'war-lordism' in China out of the Chinese army's role in suppressing the students' struggles. Nothing can be farther from the truth. Firstly, there is nothing so far to contest the fact that in China the party still controls the gun, not the other way round.. Secondly, apart from a *democratically centralised* Communist Party there does not exist today nor can there develop soon any other agency or structure which can hold together, guide and lead the country forward. It is *only* the weakening of the party's leadership that may again lead to the rise of a new war-lordism, fragmentation of the country and the plunging of the society into a new round of civil war.

The fundamental reason for this is the fact, as the CPC leadership so frequently, proclaims, that the entire history of the country since 1911 has proved that there is

no possibility or prospect of the country modernising and developing itself along a capitalist path. It is only the socialist path, or to put it more accurately and in line with the generally correct terminology of the CPC, the path of socialist modernisation, increasingly perfected by constant, cautious and self-critical appraisals that the Chinese people can advance to an enriched human existence.

And, equally fundamentally, in the absence of a numerically adequate and ideologically and politically mature working class in the country, the Chinese Communist Party *has* to play the crucial role of a surrogate leadership, somewhat autonomous of the class for some time. Even if it is not an ideal prospect, there is no escape from it.

It is significant that the Indian academic, V P Dutt, in a newspaper article while denouncing the CPC's actions in Beijing as steps towards "slipping into war-lordism" had to admit at the same time that "There are only two organised groups in China, the Communist Party and the People's Liberation Army. They alone are capable of organised action and of pursuing a co-ordinated programme." Only, Dutt is somewhat wide of the mark in treating the party and the PLA as two independent agencies. They are indeed one, led by the former. If and when they really fall apart and the PLA becomes an independent or autonomous institution, then of course there will emerge the threat of its disintegration into splintered clusters of war-lords.

The real socio-historical setting in China being what it is and the role of the Communist Party being as crucial as it is, there is the highest importance and urgency for its reformation and ideological regeneration. The party has to be sharply criticised for all its weaknesses and lapses, but only with a view to purging it of all its defects, never for weakening or displacing it. It may be remembered that in a similar situation, addressing some critics who had been demanding *drastic* actions against a certain measure of bureaucratic degeneration of the Bolshevik Party in the early post-Revolution years, Lenin had admonished all talk of 'surgical operation'. "Surgery", he had said, "in this case is an absurdity, an impossibility; only a slow cure—all the rest are charlatanry or naivete".

The logic of a frontal opposition to the Chinese Communist Party in the contemporary situation is likely to lead to a practice which will in essence amount to counter-revolution. This is evident from the follow-up to the Beijing events. Some forces in Hong Kong which began with the call for democratisation of the Chinese polity have ended today with the call for armed struggle for the overthrow of the present Chinese regime. A six-point manifesto issued by the Hong Kong Alliance in Support of Patriotic Democratic Movement in China, June 1989, ends with the following call: "All People's Army who retain their sense of integrity and justice to mobilise themselves to protect the people, turn their guns around and join the people in their fight against the fascist Deng-Yang-Li rule".

State of the Working Class

The crux of the problem in contemporary China as well as its basic solution are both intimately connected with the present state of the Chinese working class. Socialism which is essentially the historical form of working class rule in society can be properly ushered in only by the working class itself. But as is well known, the working class is numerically too small compared with the size of the Chinese population. Further, its political weightage is also very low for many historical reasons. According to available information, the total number of workers and employees in China was only 120 million in 1986. This is just about one per cent of the population. Of this, about 80 million, or two-thirds of the total number of workers and employees, were enrolled in the trade unions which are, however, considerably bureaucratised as they were run by 3,20,000 full-time off-production trade union cadres and about 1,00,000 staff members. Despite this huge body of unionised workers and despite the recent promotion of "workers' congresses" in the work-places, the political role of the working class and its organisa-

tions is extremely modest. More, even its living and working conditions have suffered some setbacks in the course of the ongoing economic and administrative reorganisations. A recent study of the working class situation published by a Hong Kong-based independent study group provides much insight into the related problems. It says:

> The history of the Chinese trade union movement, and its limited role in the revolution, did not guarantee its emergence as a powerful force within the party...

About the recent organisational innovation, the workers' congress in the work-place, the study says:

> In one sense, workers' congresses could be viewed as a form of company union, limited in scope to each single enterprise, vulnerable to management manipulation, and stripped of the broad character of a working class political movement...
> Although workers' congresses have the potential to enable direct democratic participation at grassroots level in many aspects of the management of enterprises, the institution can also be interpreted as a political setback for the trade union movement as a whole.

About trade unions proper, the study says: "Democratic control of trade unions by the membership has been limited and is quite indirect by western standards. In many aspects, it has been absent altogether, with leaders appointed from above, and policies decided by state and party directives."

Currently, with a view to alluring foreign investments in Chinese industry, the wages and living conditions of the Chinese workers have been further depressed—even to a level lower than in the neo-colonial pastures like Taiwan, South Korea, Malaysia and the Philippines.

The recent recasting of socio-economic policies has introduced considerable insecurity and instability in the living and working conditions of the Chinese workers. The above study says:

> Dramatic reforms are reaching into most aspects of life in China. For the nation's workers, the reforms are a double-edged sword. The changes may sometimes bring in more cash in hand, the opportunity to change jobs, a wider range of goods in the market. But they have also eaten away at the very basic security which urban workers have become accustomed to over decades and which they have come to expect as a basic human right. Guarantees of a job for life for both men and women, housing, medical benefits, maternity benefits, schooling, and protection in old age and childbirth seem less certain now, as the nation's leaders discuss redundancy, bankruptcy and the hiring of workers on short-term basis.

The condition of the recently recruited rural workers for the multinational enterprises in special economic zones is quite horrible. In March 1988 a China-linked Hong Kong newspaper, *Da Kang Pao*, reported on the 'Worries of the Shenzhen Temporary Women Workers', quoting one complaint:

> "We work more than 13 hours a day, overtime everyday, but have never received any overtime pay. The bosses do not allow us to drink water during work hours, we are body-searched when we go off work. Our living dormitory is crowded beyond imagination—20 to 30 women into an iron-walled room, without toilet or bathroom. How can we bear this life?"
> When this newspaper asked them why they continued working in the factory, they replied that it was because they had to leave a deposit with the management at the beginning of their employment and their wages were paid a month in arrears, so that if they voluntarily left, they forfeited the deposit and a month's wages.

Besides, there are today over seven million contract workers who suffer from various disabilities compared with even not very well-off direct employees. "Most political activities, such as district elections and party cadre selection and promotion, are carried out through the work units. Contract workers, however, do not usually have their citizenship registration with their place of employment, which in turn jeopardises these rights and benefits." Contract workers, it is said, are regarded with such disdain that some of them have difficulty in finding marriage partners.

As a result of all this, there is widespread discontent and even a sense of alienation among sections of industrial workers which is increasingly finding expression in strikes and other forms of collective protests. According to documents of the All-China Federation of Trade Unions (ACFTU) there were 129 strikes throughout China in 1987. This, however, is considered to be a serious underestimate by many China observers; there were over 100 strikes in Shenzhen alone according to these sources.

This in short is the state of the working class supposed to be the leader of the people's democratic leadership which is supposed to be the ruling alliance on People's China. In real life, despite the signboard of working class leadership, the class itself has a very modest role in running the state; even their own life and living is shaped by agencies outside and above the class. As a result there is apathy and inertia within the working class in general, while small segments are increasingly getting ranged against the party and the state leadership and have been raising the demand for the self-determination of the class.

The Workers' Autonomous Federation which was formed in Beijing to take part in the demonstrations along with the students and is still continuing underground activity is a manifestation of this current. "The problems," says a report, "the Federation was addressing focused on the corrupt bureaucracy and the existence of a privileged elite in China. The wide wage discrepancy between the workers and plant managers, the lack of workplace democracy the lack of genuine workers' representation in the policy-making process, poor labour protection and working conditions, and the deterioration of workers' living standard in recent years were among their main grievances."

The students and intelligentsia, a large part of which is today impressed and allured by the glitters of western society, are the victims of the bourgeois blandishments from within and without and a significant segment of these strata have consciously or unconsciously moved over to a position of support to the bourgeois democratic order, and hence, basically of opposition to socialism.

At the moment the peasantry is generally dormant politically. But if the situation in the countryside is allowed to run its present course without checks and balances, then economic polarisation will erode the social base of the people's democratic dictatorship in China from both the ends: the expanding new rich will be seeking unrestricted freedom and all sorts of incentives for capitalist evolution of agriculture and free trade, while the relatively impoverished people at the rural base will be dissatisfied with the regime, because of their sense of deprivation.

Democratic Aspirations Underestimated

Along with this, another factor mentioned at the beginning of this piece, that is, Deng's wrong orientation, that is, his infatuation with administrative efficiency at the expense of democratic participation, which is anti-democratic in essence (and this may indeed be the collective orientation of the CPC leadership as a whole), may complicate the situation further—in the sense that it would hamper the process of deepening the democratic character of the Chinese society. Let us have it directly from Deng himself:

> Ours is the system of the people's congresses and people's democracy under the leadership of the Communist Party. The greatest advantage of the socialist system is that when the central leadership makes a decision it is promptly implemented without interference from any quarters... We don't have to go through a lot of repetitive discussion and consultation, with one branch of government holding up another and decisions being made but not carried out. From this point of view our system is very efficient.

Deng's position in the name of efficiency and smooth functioning belittles the importance of fuller participation of the masses in the decision-making process. It is opting for a paternalistic functioning. If the present pattern is permitted to develop further, then the advertised people's democratic dictatorship may ultimately develop into an autonomous party rule of a Bonapartist character—more appropriately a Caesarian phenomenon of the progressive type, to follow the Gramscian concept.

The CPC leadership as a whole seems to be seriously underestimating the strength of the democratic aspirations of the Chinese people—for securing an increasing role in the decision-making processes. By neglecting these yearnings of the people and even more by trying to suppress them, the CPC leadership can only succeed in antagonising the masses and thus indirectly and objectively aid the counter-revolutionary forces both within the country and outside to strike deeper roots among the people.

While all these dimensions of the Chinese development have to be taken into consideration in assessing the Beijing events, commentators all along the political spectrum have come out with glib declamations on the basis of superficial symptoms. Indian comments so far may be specified into the following three categories: First, the bourgeois-liberal, gloating over the supposed demonstration of the deliberate option of the Chinese masses for the Gandhi-Nehru model of bourgeois-democracy. These commentators are not aware of the judgment of history that this model can neither come into operation in China, nor can it succeed even if it could somehow be introduced. Second, the 'intellectual'-socialist, invoking abstract democracy and abstract humanism to judge the concrete historical phenomenon which is the resultant of, to quote Engels, "innumerable intersecting forces, an infinite series of parallelograms of forces" and therefore cannot be judged by any abstract ideal. Third, the old Maoist, which has learnt nothing and forgotten nothing from the rich, though largely negative, experience of Chinese history from 1956 to 1976 and which does not realise that much of the problems which have today blossomed into a full-blown crisis owe their origin to the setback to the process of China's socialist transformation as a result of Mao's inept 'social engineering' during this period.

Basic Issues

In judging the Chinese developments, one has to take note of the following basic dimensions of the situation:

(i) Whether any section of the Beijing agitationists had a pre-meditated plan for upsetting the present regime or not, and whether the agitation had any foreign counter-revolutionary links or not, further continuation of the movement along the line it had been developing would have seriously threatened the existence and stability of the present order. Since there is no real alternative to the present order at the moment, its collapse would have only led to anarchy, nullifying the gains of the country's liberation and subsequent reconstruction. Since there is no real possibility of a stable bourgeois-democratic alternative order emerging in the country, the fall of the present order could only lead to a disintegration of the unified China into warring parts.

(ii) Even if the bureaucratisation and a certain degeneration of the CPC and its regime be true, there can be no drastic remedy to it. Any bid for a drastic—or 'surgical', to use Lenin's idiom—operation—for the purpose will only seriously jeopardise the process of socialist transformation and may ultimately lead to anarchy, etc.

(iii) The CPC has to review and revise its over-simplified concept of economic development through the incentive of private gains and 'open door' policy (not entirely abandon it) and should keep in mind Lenin's warning that even a controlled 'opening' to capitalism creates a serious challenge to the socialist course of development.

(iv) The CPC should realise that the urge for democratic mass participation in the decision-making process is an extremely powerful, and in the last analysis, helpful, factor in the process of progressive social evolution and has to be accommodated and encouraged.

(v) Finally, the key to real socialist consolidation in China today lies with the working class—how soon and how effectively it can be led and guided into playing its due role as the leader of the party and society.

Unfortunately, the Fourth Plenary Session of the 13th Central Committee of the CPC held on June 23 and 24, that is after the Beijing events, does not, as is seen from the brief Xinhua communique, indicate any basic corrections to the erroneous orientations the party leadership has been suffering from. While it again pays lip service to enhancing 'ideological and political work', it fails to mention in this connection the need to move from the level of demanding abstract loyalty to ideology to that for remoulding the practice by a close integration of the ideology with day-to-day practice. Neither does it care to highlight the fact that its basically correct programme of economic reconstruction carries with it increased scope for capitalist penetration—both in the structural and super-structural regions. More importantly, the resolution makes no mention of the party's grave neglect of the working class. It fails to highlight the key task of creating conditions for developing the Chinese working class for the leading role in society, which is its due and which is essential for the socialist advance of the country.

Mounting Antagonism towards Big Dams

Ashok K Mitra

B D Dhawan (May 20) has attempted to put the issues relating to large and medium storage route to irrigation development in a proper perspective. While he himself is not convinced with the questions raised by the environmentalists, soil conservationists, social and natural scientists against the role of major irrigation works based on big dams, he has appealed to the irrigation planners to engage in an open dialogue and discussion with their critics. His own defence against the grounds on which the idea of big dams is being questioned, however, does not appear to be too convincing. To begin with, consider first the environmental angle. While he accepts that the forest cover to be lost by a single dam like Narmada Sagar can be unduly high it is no solace to learn from him that damage to forest is much higher on account of illegal felling, unauthorised ploughing of forest lands, authorised allotment of forest land do dam oustees, and increased pressure from the grazier. Besides, for all we know, damage to forest because of all these factors may be the backlash of forest cover lost and people ousted for the construction of big dams. In any case to minimise such losses his suggestion is to decrease the storage height. But, it should not be overlooked that reducing the reservoir size is not merely a technical issue; its economic implications in terms of costs and benefits will have to be worked out in order to examine if the economic feasibility is adversely affected. A more general point, however, is that loss of forest cover cannot be counted only in terms of felled trees, it has to be seen in its entirety in terms of destroying the whole eco-system which in the long run may adversely affect the availability of water in the reservoir through siltation and deficient rainfall in the catchment area. Are all these externalities fully internalised in justifying the projects on economic grounds?

Similarly, the problem of land degradation by waterlogging and soil salinity within the canal commands served by big reservoirs, he suggests, can be effectively checked with adequate provision of drainage or the use of drip or sprinkler modes of water use as the case may be. But, the cost of drainage work is no different from that of the canal network itself and hence because of paucity of investment fund this work is missing from our major canal network. Yet the benefit is estimated on the entire potential created disregarding the fact that owing to lack of drainage gradually in the long run more and more land in the canal command would get degraded. Has this been properly accounted for in cost benefit analysis to justify the project on economic grounds?

Secondly, consider the technical issue related to seismic disturbances owing to impounding huge mass of water as in the case of Tehri dam in Garhwal which may cause an earthquake of severe intensity leading to utter disaster. Again, is the safety factor suggested by Dhawan considered in full, if so, is the increased cost involved in ensuring such safety economically justify constructing such dams? Tehri dam's case in this respect has been very clearly brought out by Paranjpye which merits very serious consideration.*

Thirdly, the sociological angle of rehabilitation of dam oustees, one of the most sensitive issues, cannot be settled by earmarking a lump sum amount as compensation to be paid as suggested by Dhawan. The nature of compensation to be paid, the manner in which it is to be paid, the period over which it is to be paid and whether it covers the annual income earned by the oustees have to be examined in detail. The planners and the officials are most secretive about these details. One wonders, if the compensation is arrived at in this manner how far would the project be viable in terms of benefit-cost ratio.

Fourth is the issues directly related to economic aspects of alternatives to large dams. It is very well known that the returns from investment on big irrigation works is abysmally low, project after project, for various reasons, some of which are rooted in the issues discussed above. It would therefore be irrational to be obsessed with the big dam projects and not to examine threadbare the technical and economic issues related to alternatives, mainly of course, minor irrigation. It would not do to call the assertion of superiority of minor irrigation as 'myths' and 'half truths'; a great deal of homework needs to be done to dispel the myths and half-truths about superiority of minor irrigation, if at all. It is nobody's case that the two are mutually exclusive. To the extent that waterlogging in the canal command could be considerably reduced and that ground water sources could be recharged considerably, under different circumstances, by conjunctive use of surface and canal water there is need for both for a balanced development of irrigated farming.

Lastly, the question of distributive justice is a very relevant consideration in any development project in an underdeveloped country like India. It is because of this consideration that in cost-benefit analysis of irrigation projects one is often confronted with the question of whose benefit at what (whose) cost? Considering the valid accusation that beneficiaries of big dams are mainly the influential and well-to-do farmers and the affected ones are mainly the tribals and other economically weaker sections of the population, a premium ought to be attached to the income distribution effect of a development project which benefits more the weaker sections of the society. Alternatives to big dams like Narmada Sagar and Sardar Sarovar need also to be examined from this point of view.

The controversy regarding big versus small irrigation dams needs to be examined in its entirety in a multidisciplinary approach and not in piecemeal manner as objections raised by environmentalists, ecologists, technicians, economists, sociologists, anthropologists, etc. With the advancement of knowledge and expansion of its frontier it is now possible to analyse and discuss the issues in developmental planning in all its aspects from the long-term perspective so that the social output could be increased by maintaining and preserving the natural re-sources and not at the cost of depleting these. It is against this background that there is an urgent need for an overall long-term national policy for the efficient development and management of land and water resources in the country.

NOTES ANNEXED TO AND FORMING PART OF THE ACCOUNTS OF THE INDIAN BRANCHES FOR THE PERIOD JANUARY 1, 1988 TO MARCH 31, 1989

1. Pursuant to a merger during the period of Deutsche Bank (Asia) AG with Deutsche Bank AG, the entire undertaking of Deutsche Bank (Asia) AG in India has been taken over by Deutsche Bank AG.

2. Head Office Reserve Account comprises of:
   (i) Capital amount of Rs. 2 million brought in from Head Office in compliance of Section 11(2)(a) of the Banking Regulation Act 1949 and
   (ii) the funds remitted by Head Office in DM equivalent of Rs. 22.97 million together with a portion of approved remittable surplus for the year 1987 amounting to Rs. 2.15 million retained by the Bank to meet the cost of acquisition of residential premises at Bombay and to meet the Deposits/Advance Rent of Bank Premises at Delhi as per the Reserve Bank of India's guidelines.

3. The provisions for Interest tax for earlier years from 1.1.1982 to 31.3.1985 have been made on the basis of the stand taken by the Bank in the Returns of Chargeable Interest filed by it with the assessing authority in respect of which assessments are in progress. Should the assessing authority take a different view in assessments, there could be an additional charge for Interest tax amounting to Rs. 2.16 million.

4. Previous year's figures have been regrouped wherever necessary and are not comparable with the current period figures which are for a period of fifteen months.

Auditors' Report on the Accounts of the Indian Branches of Deutsche Bank AG Under Section 30 of the Banking Regulation Act, 1949.

have audited the attached Balance Sheet of the Indian branches of Deutsche Bank A G (in- porated in the Federal Republic of Germany with limited liability) as at 31st March, 19 9 and Profit and Loss Account of the Indian branches of the Bank for the period 1st January, 1988 st March, 1989 annexed thereto.

Balance Sheet and Profit and Loss Account have been drawn up in accordance with the pro- ons of section 29 of the Banking Regulation Act, 1949 read with the provisions of section of the Companies Act, 1956.

report that:

we have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of the audit and have found them to be satisfactory;

the transactions which have come to our notice have been, in our opinion, within the powers of the Indian branches of the Bank;

(3) in our opinion, proper books of account as required by law have been kept by the Indian branches of the Bank so far as appears from our examination of these books;

(4) the Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account;

(5) in our opinion and to the best of our information and according to the explanations given to us, subject to note 3 regarding short provision of Rs. 2.16 million for interest tax, the accounts together with the notes thereon give the information required by the Companies Act, 1956 in the manner so required for banking companies and, on such basis, the Balance Sheet gives a true and fair view of the state of affairs of the Indian branches of the Bank as on 31st March, 1989 and the Profit and Loss Account gives a true and fair view of the profit of the Indian branches of the Bank for the 15 months ended on that date.

Caste: Change and Continuity

In the mid-1950s in Khalapur in western UP, about 100 miles north of Delhi, the central issues in the discourse on caste were educational and occupational access for low-caste and untouchable people, and practices of untouchability like using wells, sitting as equals or sitting hierarchically, giving and taking of food and water, sharing waterpipes together, and so on. Has the discourse on caste changed over the past 30 years? If so, in what way? Khalapur revisited. **1831**

Despite many political and administrative changes, in many ways time has stood still in Surendranagar in the Saurashtra region of Gujarat. The continuities were brutally emphasised on May 20, 1989 by the killing in broad daylight of two persons from the backward Gadhvi community in Devlia village for the singular crime of digging a well on their own land. **1812**

Forestry and Ethnocentrism

Ethnocentrism and western biases have long been identified as sources of inappropriate and unsuccessful development efforts. Forestry offers an interesting case study of professional ethnocentrism and its adverse effects. The ideology of renewable resource management is so comprehensive, so explicitly preached, and has for a long period of time been so fervently adhered to that it provides a particularly useful focus for this type of inquiry. A study of American forestry professionalism in the third world. **1839**

Technology Politics

Is the slogan 'leap-frogging into the 21st century' really as apolitical in its approach to development as it is made out to be? Will it spur the young people of India to work towards an environment that encourages innovation, hard work, sacrifice and even dreaming? And where has this new ideology emerged from? **1815**

Policy-makers and scientists in the third world can no longer afford to be naive about the political significance of biotechnology in the next decade and need to pay close attention to the World Bank's initiatives to sow the seeds of a new biorevolution in the third world. **1819**

DRC: A Closer Look

The increased use of domestic resource cost (DRC) in analysis of economic policy changes in India has been welcomed as a step towards efficient resource allocation. It is necessary, however, to be clear about the specific deficiencies of the present DRC estimation practices and to consider alternatives which could be adapted in analyses of DRC-based comparative advantage of Indian industry. **1845**

Paying for the Showpiece

Unlike other towns and cities in the country, Delhi does not have to worry about where the money for its civic amenities comes from. There are, after all, some 800 million Indians to foot the bill for maintaining the nation's capital as a showpiece. **1809**

An American Idea

The rhetoric currently being employed in some socialist countries would suggest that the free inflow of foreign capital is not as dangerous as a free newspaper. No wonder American ideas are dominant everywhere, for that is a typical American idea. **1808**

Paying Peter and Paul

Poland's high indebtedness simultaneously to the developed capitalist countries as well as to the CMEA countries complicates the task of finding a solution to the problem of the country's foreign debt. **1827**

Non-Payment Campaign Pays

The BJP's loan-waiver campaign in Madhya Pradesh has proved to be a striking success. The gimmick has caught the imagination of the rural people and is causing sleepless nights to Congress(I) leaders. **1823**

Civil Liberties: Selective Defence?

IF, as APCLA secretary A P Vittal suggests (July 15), Balagopal has not been able to hide his pro-extremist bias (June 17) neither has Vittal himself been able to conceal his pro-CPI(M) bias.

As a champion of the civil liberties movement, the secretary of APCLA is expected to be above petty party politics. His contention that the situation existing in the state (killing of extremists in the name of encounters) is somewhat "justified" and that "even those who are otherwise democratic do not protest much about it" does not do him any credit. It is indeed, a matter of shame that a civil liberties activist should justify such callous violations of human rights. The International Charter of Human Rights does not restrict civil liberties and democratic rights only to privileged sections but extends them to each and every citizen, irrespective of ideological convictions. Vittal argues that it is impossible to "go on fighting for the civil liberties of those who do not have even an iota of respect for the civil liberties of others". It is ironical that a civil liberties leader has to be told that civil liberties organisations are expected to fight against every instance of civil rights violation, irrespective of the victims' attitude towards civil rights.

If a petty thief is killed in police lock-up, should civil liberties bodies keep silent merely because the thief does not respect the civil liberties of others? Consider the case of Raju, a 20-year old petty thief, who the police allege, escaped from police custody in the first week of July. His body was found just near the Saifabad police station in Hyderabad, where he was being interrogated, a few days after his reported escape. The case was taken up by the APCLC while APCLA did not raise even an eyebrow. Possibly their inaction was a protest against the thief's disrespect for civil liberties and property rights.

Vittal's use of the expression 'fighting' is questionable. Where has the APCLA ever fought? Does it need to fight at all, when the CPI(M) considers the TDP government its own. APCLA voices concern only when CPI(M) workers or sympathisers fall victims to police brutality.

In his effort to cast aspersions on Balagopal's approach and in his enthusiasm to brand the PWG as a bunch of anti-socials, Vittal has resorted to misinformation. He claims that the PWG blackmailed the government to release two of their arrested comrades. Press reports however, say that PWG merely demanded information regarding the whereabouts of their two 'missing' comrades. In fact the government has only instituted a judicial enquiry. The ghastly murder of Malhara Rao is the result of the silence that was maintained until recently by political parties, on the issue of preservation and protection of democratic rights of the people.

Although of late, all political parties, have unequivocally condemned the encounter policy of the TDP government, neither the CPM nor the APCLA have uttered a word against the fake encounters. Even the governor has appealed to the conscience of the police to stop the excesses but the APCLA leader still remains unmoved.

Vijayawada

Left Alternative in Andhra

THE article on the Andhra Pradesh subsidised rice scheme by Wendy K Olsen (*EPW*, July 15) is among the well researched and comprehensive articles to have come out on the subject. No progressive individual, group or party can disagree with the conclusion that the rice rationing scheme helps people but it cannot be said to 'eradicate poverty'.

However, with regard to the points made on the political situation in Andhra Pradesh there were some inaccuracies. The CPI (M) has been described as the left alternative in AP, while there is no mention of CPI anywhere in the article. By no stretch of imagination can the CPI(M) become the left alternative in AP. Firstly with regard to size—at the beginning of 1989 the total membership of the CPI in AP was 75,000 whereas that of the CPI(M) was only 22,000. In Andhra Pradesh the CPI is a mass-based party with a well knit organisational structure in all the districts of the state, while the main strength of the CPI(M) is from the Khammam, Nalgonda, Krishna, West Godavari and Nellore districts (even in these districts it falls behind the CPI). The mass organisations of the CPI(M)—CITU, SFI, DYFI, Kisan Sabha and Agricultural Labour Union are no match for the organisational spread and influence of the CPI's mass organisations AITUC, AISF, AIYF, Kisan Sabha and Khet Mazdoor Union.

The relative strengths can also be assessed from their showing in the various elections. In assembly elections, except in 1978 when CPI(M) won eight seats with the support of the Janata as against six of the CPI (won almost independently though there was a nominal alliance with Congress (S), the CPI's strength has been either more than or equal to CPI(M)'s strength. In the elections to the gram panchayats, panchayat samithis, municipalities and municipal corporations in 1980-81 CPI'S strength was second only to the Congress(I). In the mandal praja parishad elections held in 1987 CPI(M) won 42 mandals (which were gifted by NTR) while CPI on its own won 14. In the gram panchayat elections held later despite alliance with NTR, CPI(M) could win far fewer seats than CPI.

The relative strength apart the CPI formed a left and democratic front comprising of CPI and other smaller parties like MCPI, RPI and AP Lok Dal and gave a call for CPI(M) also to join it. But till date the party refuses to do so and steadfastly toes the line of Telugu Desam. Despite this regime being brutally authoritarian and anti-people and whipping up regional and communal chauvinism as and when it suits, CPI(M) is still clinging to the coat-tails of NTR. Such an opportunist stand has lead to active cadres leaving the party in droves.

The CPI(M)'s Warangal and Hyderabad city units have long since gone over to MCPI. And in districts like Khammam, Nalgonda, Krishna etc, many have joined the CPI. Miriyalguda was once known as a stronghold of the CPI(M) where no CPI cadre could enter. But a number of active members of the CPI(M) disgusted with the policies of the state unit have since crossed over to CPI and early this year the CPI held its Nalgonda district conference there.

The statement in the article on CPI(ML) also is too simplistic "CPI(ML), which is also popular among radicalised youths, is ruining its chances by engaging in terrorist tactics and indulging in revenge murders". CPI(ML) is not a single party. It has since split into several groups, most of which are actively working among the masses and are also making use of the parliamentary forums. One group of CPI(ML) has an MLA from Khammam district. Only one group—the PWG led by Kondapalli Seetharamaiah is indulging in' "terrorist tactics".

The left alternative in Andhra Pradesh should now comprise of the CPI, MCPI and various groups of CPI(ML) who have renounced annihilation methods. In fact the 14th conference of CPI at Calcutta gave a call on such lines. And in view of the pre-eminent position of the CPI among the left parties and groups in AP it is but natural that such an alternative should be lead by it.

P Satish

Mangalore

Not Second

ARUN GHOSH (July 1, p 1430) is wrong. Kanshi Ram did not come second in the Allahabad Lok Sabha by-election, nor did he beat—'hollow' or otherwise—the Congress(I) candidate; he came third.

Calcutta

ECONOMIC AND POLITICAL WEEKLY

Sri Lankan Misadventure

THE Indian army in Sri Lanka, it has now been established beyond the slightest doubt, carried out a massacre of Sri Lankan Tamil civilians in Velvettithurai town in the Jaffna area in a deliberately planned operation which began on August 2 and went on for three days. The action was the Indian troops' reaction to the ambushing of an Indian army patrol by the LTTE in which six Indian soldiers were killed. The Indian army's murderous retaliation directed at the civilian Tamil population has been described thus by an Indian journalist writing from Jaffna: "Within hours the IPKF ringed the town, mobilising forces from nearby camps, and commenced shelling the area. When the shelling stopped, a search operation was launched as the troops fanned out on a house-to-house search looking for Tigers. The locals charged that the residents huddled inside houses were dragged out and shot in cold blood. The local citizens' committee says that at least 70 civilians, including women, were killed in the three-day operation. The Red Cross figures support this claim." The report quotes a Jaffna Red Cross official as saying: "According to our estimate and that of the UNHCR at least 70 civilians have died. And about 15 are women. We are unable to give the exact figure as at least 58 persons, including many boys, are missing." In the two years that the so-called Indian Peace-Keeping Force has now been in Sri Lanka, this incident, while it may be one of the ghastlier ones, is by no means unique or exceptional. What lent it special political significance was that the killing of the Tamils and the plunder of Velvettithurai occurred at just the time when the Indian government was trying to make out, in its talks in New Delhi with the Sri Lankan delegation headed by that country's foreign minister, that the continued presence of the Indian army in Sri Lanka was essential for the safety and security of the Tamil population of northern Sri Lanka.

The fact is that the Indian army in Sri Lanka has not been engaged in ensuring the safety and security of the Tamil population. Its mission has been an altogether different one: to conduct a war to subdue the LTTE. As part of this effort it is currently supporting and trying to bolster up the EPRLF, a rival Tamil group with little popular support which formed the provincial government after the elections last year were reduced to a sham because of the very effective boycott call by the LTTE. Indian armymen have for some time been engaged in forcibly recruiting, training and arming the so-called Civil Volunteer Force which is effectively the armed squad of the EPRLF. And the Indian government has been financing the whole operation. Clearly, one of the purposes of stretching out the withdrawal of Indian troops from Sri Lanka till February or March next year, as the government of India has proposed in the recent talks with Sri Lanka in New Delhi, is to gain time to complete these efforts. If the government of India is hoping through these manoeuvres to consolidate a quisling Tamil government in northern Sri Lanka, it is most unlikely to succeed. For in the charged atmosphere after two years of military operations by the Indian army, proximity to the Indian authorities and the backing of the Indian troops cannot amount to much less than the kiss of death for the EPRLF and its government as far as the sentiments of the Tamil people are concerned.

The government of India keeps protesting its commitment to the sovereignty and territorial integrity of Sri Lanka. If these protestations have any meaning at all, it should acknowledge that the protection of the Tamils in Sri Lanka and the working out of an acceptable arrangement for devolution of powers to the provincial government in north Sri Lanka are not matters in which India can have any role to play. If the agreement signed with the Jayewardene government suggests anything different, that only reflects president Jayewardene's desperate political position at the time and the government of India's short-sighted readiness to try to capitalise on that situation. As things are today, by insisting on prolonging the Indian troops' military operations in Sri Lanka the Indian government will not help to secure either the safety of the Tamils or satisfactory devolution of powers. What it will achieve is the aggravation of political turmoil in Sri Lanka, pushing the Premadasa government to eventual collapse, for it is clear that president Premadasa can have no hope of controlling the JVP's bloody rebellion in the south so long as the northern part of the country continues to be under the occupation of alien troops. Of course, before he finally goes under, Premadasa will no doubt try some desperate measures of his own, such as perhaps taking the issue of the withdrawal of Indian troops to international forums. The net effect would be to rupture relations between the two countries.

Such then are the consequences of the government of India's insistence on playing the regional gendarme in relation to Sri Lanka. But so mesmerised are the prime minister and his advisers with this role and the populist political dividends it is supposedly yielding them within the country that they will not be persuaded to retrace their steps unless public opinion here is mobilised to bring them back to a saner course. Unfortunately, the organised left parties which should have been expected to take the lead in this effort have remained quiescent so far. Their inactivity, if not tacit support to the rulers' chauvinist and jingoist schemes, is costing the country dear.

POLITICS

In True Colours

THINGS are bad enough with the National Front what with the ongoing tussle between Chandra Sekhar and V P Singh in the Janata Dal, and its uneasy relations with the Left on the one hand and the BJP on the other. Now, to make matters worse, each of the two unpredictable 'satraps' from the north and the south—Devi Lal and NTR—already known for their 'gaucherie', in their respective states has dropped a brick! Davi Lal, we hear, is trying to retract. But the damage has already been done. The saffron-clad actor from the south, we believe, is still intractable.

The Haryana chief minister—a leading light of the National Front—proposed sometime ago to amend the Hindu Succession Act to deny daughters a right to the agricultural property of their parents, and instead to allow them to have a share of the property of their in-laws. The implications are clear. The big farmer-dominated, patriarchal Jat society, which is Devi Lal's vote bank, by denying their daughters any right to parental property can reduce the division of their land-holdings and retain them within their own fold. As for the daughters-in-law, who are supposed to be entitled to a share in the property of their in-laws under Devi Lal's dispension, the male in-laws can see to it that they do not claim the share, or if they really try to assert their claims, things can be arranged in such a way that they can be got rid of. Incidentally, in Devi Lal's own family sometime ago, a daughter-in-law got killed in mysterious circumstances—a case which is still being investigated. In Haryana, and many parts of the Hindi belt, where male oppression of women sanctioned by religious bigotry is the law, one can well imagine the pernicious effects of Devi Lal's proposal. It is reported however Devi Lal is dropping the proposal—presumably faced by the mounting opposition, and the fear that it would be used by the Congress(I) against him in the elections. But the very fact that such a proposal could be mooted by a National Front leader and his government speaks a lot about the moral norms and beliefs of a politician who is expected to provide an alternative at the centre, if voted to power.

The scenario in Andhra Pradesh is even more bizarre. Here is a state—redolent of the communist-led peasant movement of Telengana—where the electorate has decided to vote to power a tin god who spends most of his time on 'Gayatri Maha Yagnas' or tantrik rituals to find solutions to the problems faced by his state, or by himself in the role of 'Vishwamitra' in his latest film. The poor tribal peasants of Andhra Pradesh could not have cared a fig for such buffoonery had they been left to themselves by the state. But now, NTR has decided to repeal Regulation 1 of 1970. This Regulation prohibits the transfer of land owned by non-tribals in the scheduled areas to anyone except to the tribals and to the government. The implications of NTR's decision to reverse this should be obvious.

The historical context of NTR's proposal is important. For years together plainsmen had poured into the tribal areas as merchants, middlemen, moneylenders and had managed to appropriate land from the tribals. The encroachment by these non-tribal people continues. According to official statistics, till December 31, 1987, there were 44,379 cases of unauthorised occupation of 1,89,337 acres of tribal land by non-tribals in the scheduled areas. Unofficial statistics indicate six lakh acres under the possession of non-tribals.

One of the reasons why NTR is keen on the repeal of Regulation 1 could be the pressure from the absentee landlords in the tribal areas, who because of the increasing threat from the People's War Group and other Marxist-Leninist tribal guerillas, want to dispose of their land. One wonders, however, who would want to buy the land in these 'disturbed' areas. The other reason could be the rising land prices in certain tribal areas because of several development projects.

Whether it is a Devi Lal or an NTR, if we scratch them, the old Adam in them comes out—the instinct which in the absence of a yet-to-be discovered better term can still be defined as what Marx described as 'class interests'.

EXTERNAL DEBT

Entering the Big League

THE government persists in the meaningless charade of understating the country's external debt. According to a statement by the minister of state for finance, B K Gadhvi, in answer to a question in the Lok Sabha last month, India's aggregate external debt at the end of March 1989 was no more than Rs 68,831 crore. Converted at current exchange rates this would give a figure of $ 42-43 bn. That this is a gross underestimate should be clear from the fact that the OECD's annual review of external debt titled *External Debt Statistics* had placed India's foreign debt outstanding at the end of 1987—that is, 15 months prior to the date for which the figure given to the Lok Sabha by the minister of state for finance supposedly relates—was already $ 50.36 bn. Clearly, the information provided to parliament by the government is worthless and fully justifies the remark reported to have been made by a former senior official of the Reserve Bank of India at a recent conference on the state of the Indian economy that whereas earlier the government sought to build up 'secret assets' by understating the size of the country's foreign exchange reserves, now it was going to great lengths to conceal the true magnitude of the country's external debt and was thus accumulating 'secret liabilities'. Given the government's refusal to disclose the extent of the country's external debt, there is no alternative but to wait for the next volume of the OECD's *External Debt Statistics* to get an idea of how much deeper the country had sunk into external indebtedness at the end of 1988.

In the meantime the latest issue of the semi-annual report *Statistics on External Indebtedness* put out jointly by the OECD and the Bank of International Settlements, Basle, has just become available. The data presented in this report deal only with bank and trade-related non-bank external claims. The latest report, which claims to incorporate data available up to July 12, 1989, puts outstanding external bank claims on India at $ 12.86 bn at the end of 1988, at which level the figure showed a rise of $ 1.46 bn over that at the end of 1987. The relevant earlier issue of the report had put India's outstanding indebtedness to banks at the end of December 1987 at $ 7.60 bn. In other words, our external debt to banks rose by $ 5.26 bn or by over two-thirds in the two years 1987 and 1988.

In terms of the size of outstanding debt, India is admittedly still only on the fringes of the big league of borrowers from the international commercial banks, though in terms of total external debt it is now said to rank third among the LDCs after Brazil and Mexico. India's outstanding external debt to banks of $ 12.86 bn at the end of 1988 was small beer compared to Brazil's $ 75.89 bn and Mexico's $ 69.41 bn. Argentina ($ 35.09 bn), Korea ($ 26.66 bn), Venezuela ($ 25.56 bn), China ($ 23.80 bn), Indonesia ($ 19.78 bn) and Taiwan ($ 16.29 bn) were all still well ahead of India. However, it is also significant that in 1988 while the erstwhile heavy borrowers from banks made large net repayments, India was the second largest net borrower from banks among the LDCs. India's net borrowings of $ 1.46 bn

in 1988 were second only to those of China which, however, outdistanced us impressively with net borrowings of $ 6.95 bn during the year. China in fact boosted its outstanding external debt to banks by nearly 117 per cent between the end of 1986 and 1988, from $ 10.97 bn to $ 23.80 bn. India's progress towards joining the club of big borrowers from banks has been less spectacular but nevertheless disconcertingly steady.

MINISTEEL PLANTS

Scrap Shortage

THE ministeel plants have been playing a crucial role in bridging the demand-supply gap in respect of finished steel products. However, their performance has been hampered by shortage of melting scrap and its rising prices in the domestic and international markets. Domestic availability of scrap is between 2 and 2.5 million tonnes, while demand is around 6 million tonnes. Thus the ministeel units are required to depend on imports for almost 60 per cent of their requirements of scrap.

Traditionally, the Metal Scrap Trading Corporation (MSTC), the canalising agency, has been importing scrap from the general currency areas against payment in free foreign exchange. However, in view of the acute foreign exchange shortage, it was decided last year to import scrap also from the rupee payment area. Accordingly, a protocol was signed with the Soviet Union for supplying 8 lakh tonnes of melting scrap. Unfortunately, scrap imports from USSR have run into unforeseen difficulties. According to reports, the Russians do not have at their disposal a sufficient number of ships suitable to carry scrap. Bulk carriers of 20,000/25,000 DWT capacity are needed for the purpose. The government of India is also not in a position to make available such ships immediately. The surface transport ministry is now in the market trying to locate suitable vessels on charter. Moreover, port problems at both ends have also created supply bottlenecks. Consequently, though the contract was signed for shipment of 1 lakh tonnes of scrap out of the protocol quantity of 8 lakh tonnes, only 5,000 tonnes have arrived so far. At this rate, according to S K Agarwala, chairman of the Steel Furnace Association of India, total imports from the Soviet Union may not exceed 4 lakh tonnes by March next year. He estimates the current year's shortfall in melting scrap at 3 million tonnes. Firm import commitments so far are only 1.5 million tonnes and Agarwala has appealed to the government for immediate release of foreign exchange to facilitate import of another 1.5 million tonnes.

There is an imperative need to expedite scrap imports so that the working of the ministeel units does not suffer. For the foreign exchange cost of importing finished steel will be much more than that of importing scrap. The country has been importing between 1.3 and 1.4 million tonnes of finished steel every year since 1986-87.

There are now 173 ministeel plants in the country, with a total licensed capacity of 5.4 million tonnes. Of these, 166 are in operation and they produced 27 lakh tonnes of steel products in 1988-89. Letters of intent have been issued for additional 2.78 million tonne capacity. Moreover, a notification was issued in February allowing existing ministeel plants to expand upto 150 per cent of their current capacities. Recently the government has also announced a sharp increase in the minimum economic capacity (MEC) of ministeel plants manufacturing steel through the electric arc furnace route and those engaged in the production of cold rolled steel strips and sheets. The revised MEC for ministeel plants producing steel in arc furnaces has been trebled to 1.5 lakh tonnes per annum from the present level of 50,000 tonnes.

It is evident that the demand for melting scrap would rise substantially once the existing units expand their capacities and the new capacity covered by letters of intent already issued materialises. True, efforts are also being made to increase the availability of sponge iron by licensing new capacities. Even so, since sponge iron is only a partial substitute for melting scrap, there is no escape from augmenting the supplies of scrap through higher imports, at least in the near future.

LABOUR

Laws Ignored

Bharat Dogra writes:

THE imposing roadside mansions, including a luxury restaurant, on the stretch of Delhi's ever-busy Ring Road around the Shalimar Bagh bus stop give the impression of prosperity. Turn to the road towards the railway crossing and you will see shop after shop of glittering steel utensils. This is Wazirpur, a big centre of steel utensil manufacture. Move into one of the roadside lanes, however, and you will come face-to-face with the stark reality of a huge, sprawling industrial slum.

Here there are huge piles of iron and steel scrap (or scrap-like sheets) and cart-pullers carrying these sheets on their ramshackle carts. And there are the sheds where these sheets undergo numerous industrial processes before emerging as the glittering steel utensils that decorate the shops. There are children with their bodies and faces blackened in the process of polishing the utensils. Women inhale toxic fumes as they work with acidic solutions. And if it is one of those bad days which are becoming quite frequent, one may also see a profusely bleeding worker, the victim of an industrial accident, being rushed to one of the medical shops that pass as nursing homes.

The predominant feature of the Wazirpur steel units is the unauthorised or illegal nature of most of the work. Most of the units are unregistered and are functioning in premises which were meant to house some other units. It follows that numerous other transactions, from taxes to electricity connections, are also illegal. But the area where this flouting of laws causes the maximum human suffering is the wholesale violation of labour laws.

The worker here toils for a 12-hour work-day. If one calculates the wage on an 8-hour work-day basis, the overwhelm-

ing majority of the workers do not get the minimum wage, despite the fact that the work is extremely tiring and hazardous. On the one hand, there is the large incidence of accidents caused mainly by flying steel chips, hitting the workers like bullets, piercing and entering their bodies. The risk is most serious for workers employed on the steel-rolling machine, known in local parlance as 'forahi machine'.

The risk depends on which part of the body is hit and how deep the wound is. Several workers have died in such accidents. In the month of October 1988 four deaths and over a dozen serious injuries were reported from these factories. The lack of proper medicare for these victims results in avoidable complications and even deaths. Regularly workers are incapacitated as a result of these accidents. According to a list prepared by the Delhi General Mazdoor Front and the Mazdoor Kalyan Manch, 18 serious accidents causing painful injuries and infirmities were counted during just the 20 days from January 30 to February 18 this year, for which they kept records and prepared lists. The overwhelming majority of accidents were caused by small steel chips released in the course of the work at enormous speed which pierce the workers' bodies. Some accidents were caused by workers' hands getting caught in uncovered machines. The list includes only those cases which come to the notice of the trade unions. In addition, the workers say, there are several cases of accidents which do not come to notice as these are hushed up with the collusion of factory owners and nursing homes.

Alarming as the working conditions are, it is extremely difficult to organise the workers for the redressal of the manifold problems and injustices they face in their daily working lives. In the absence of any initiative from the labour department or any other government agency to help them, the odds are heavily against the workers in any struggle to assert their rights. Past experience tells them that they can expect hardly any help from the labour officials and the police will almost certainly side with the factory owners.

While the poor workers can be easily starved out, the factory owners, most of whom are involved in only one of the numerous processes, and can easily give their work for the time being to other factory owners or can afford to close their factories for some time. This is why it is extremely important for senior labour officials to assert themselves and intervene to check this gross violation not only of labour laws but also of basic human values right in the heart of the capital city.

New Factors

THE latest exhibition of Israeli machismo—officially described as an anti-terrorist operation—has indubitably contributed to magnifying the crisis in West Asia. Moral considerations apart, Israel's kidnapping of the Shia cleric Sheik Abdul Karim Obeid, the Imam of Jibsheet, was certainly an ill-judged move. Equally injudicious was its timing for it came just when post-Khomeini Iran's moderation held out at least some hope for Lebanon.

Israeli commandos abducted Obeid, who belongs to the Hizbollah (Party of God), from South Lebanon on July 28. In retaliation the Organisation of the Oppressed of the World, which is a part of Hizbollah, hanged an American hostage, William Higgins. Higgins was supposedly an officer in the UN peace keeping force, though it is possible that he was engaged in espionage, as his killers claim. The Revolutionary Justice Organisation, another affiliate of the Hizbollah threatened to kill another US hostage, Joseph Cicippio. His killing has since been deferred and Israel, seeing in the stay of the execution a vindication of its act and a confirmation of its tactical wisdom, has not yet stopped congratulating itself.

Israel has offered to release Obeid and other Lebanese Shias held as prisoners at Al Hiam, a prison in the South Lebanon security zone, in exchange for the 17 western hostages and three Israelis currently being held by Shia fundamentalist groups. The Revolutionary Justice Organisation has, on the other hand, offered Cicippio's release on the condition that Israel release Obeid, 150 prisoners belonging to different factions of Islamic resistance organisations in Lebanon and 300 Palestinians arrested during the *intifada*, besides permitting the return of deported Palestinians to occupied territories.

In sharp contrast to Israel's characteristic myopia, the American response has been refreshingly uncharacteristic. The current administration's circumspection is certainly a welcome change from the brash rhetoric and reckless adventurism of the Reagan administration. It has, so far, refrained from military action, despite pressure from jingoistic right-wing elements intent on revenge and 'justice'. Equally promising is the new attitude towards Israeli terrorism. Whereas in the past the west glossed over Israeli crimes in west Asia, reserving its denunciations for the Arabs, the recent crisis has provoked an unprecedented attack on the abduction. How far this phenomenon is linked to the delicate position of the 17 western hostages, whose lives have been endangered by Israeli action remains to be seen. Recidivism most certainly cannot be ruled out.

The Arab world has almost uniformly condemned the hanging of Higgins, with even Syria, which backs the Lebanese Shias, joining in. Iran, whose influence with the Lebanese Muslims is quite powerful, has gone so far as to offer mediation although the interior minister, Ali Akbar Mohtashemi, has adopted a hard-line anti-US stand.

While hostage-taking has been a traditional political pastime in west Asia, being an inseparable part of diplomatic negotiations as an instrument for improving bargaining positions, the recent incidents may have been governed by a new set of factors within an altered environment in the region. The killing of the American hostage may perhaps have been an attempt at sabotaging the improving US-Iran relations under Rafsanjani's regime, for fear that improved relations could imply reduced support for Shia fundamentalist groups. Likewise the timing of the Israeli action points to certain possible motives.

There is no reason to believe that Israel's objective does not go beyond the official claim that the kidnapping was undertaken to secure the release of Israeli prisoners. The three Israelis have been captive in Lebanon for a few years. Besides, the kidnapping was planned at least two months before it was actually carried out. One hypothesis is that the hard-line Hizbollah was losing ground to Nabih Berri's moderate Islamic Amal in South Lebanon and the abduction was a tactical move to circumscribe the Hizbollah's activities even further by removing one of its top leaders. However, the authoritative claim that Obeid is not a powerful force within the Hizbollah militates against such reasoning.

Another possibility is that Israel, whose martyr image in the west has suffered a decline following its brutal handling of the *intifada*, particularly after the Palestine Liberation Organisations' renunciation of violence, may have been motivated by the desire to reverse this tendency. The rationale in this case would be to ignite a resurgence of anti-Arab feelings in the west by provoking the Lebanese into killing one of the hostages. This would dilute anti-Israel criticism besides legitimising Israeli crimes against Palestinians. Defence minister Yitzhak Rabin's statement that all possible responses, including the one that was eventuated, were considered, would seem to confirm this motive. Engineering ethnic mistrust underlies such a play. Such motivations are not beyond a state whose foundation is ethnic fanaticism.

TWENTY YEARS AGO

EPW, August 9, 1969

Concessions under duress have to be made warily, for, the danger is that they might not fetch any returns. Days after the jute mill workers' strike has begun, the Indian Jute Mills Association is in the process of using this paralysis of a major exporting industry to exact those concessions in excise and export duties on which it had been consistently turned down in the past months... Leading financiers who are leading members of IJMA have resources not only to publish pious self-selling ads in Calcutta's newspapers, but also to secure the intervention of none less than the prime minister to obtain their compromise offer of an interim relief... It would be indeed a bitter irony if, in the latest round of give and take between industry and government, afforded by the workers' strike, the workers' case is, by default, sold down the river. Their charter of demands includes a minimum wage of Rs 264 as against Rs 142 per month, redress for the 'badli' workers who are perpetually temporary, and an eight per cent bonus. Since in practice duty concessions will no doubt be linked to wage increases, there is likely to be a tendency to scale down these demands... There may yet be a case, judging by the experience of the more efficient of the mills, to considerably lower the export and/or excise duties on jute goods. But the onus is once again going to be on the central government to ensure, first, that workers' demands are met in relation to the real and potential strength of the industry, and second, that a significant part of duty concessions is spent on modernisation and raw material programming.

* * *

The DMK in Tamil Nadu is trying to give its public image a face-lift. The rift at the top of the party between Karunanidhi and Nedunchezhian, which came into the open in the battle for succession after Annadurai's death, has been seemingly patched up... But no amount of face-lift can cover the major weakness of the DMK which is that it has had nothing to offer by way of new policies over what had been achieved by twenty years of Congress rule. The expectation that as a party of the socially under-privileged it will bring forward some radical programmes has been completely belied. It has failed even to extend its cheap rice scheme—one of its major election promises—beyond Madras and Coimbatore cities because it chickened out of taking the necessary procurement measures. On the non-ideological plane, it has been unable to maintain the momentum of industrial development built up during Congress rule.

(2) Figures in brackets denote percentage variation over previous period.

TATA UNISYS

Accent on Software Development

TATA UNISYS has commenced work at NOIDA Export Processing Zone, near New Delhi, where it plans to instal a 2200/400 and a 6000/50 computer system to give an impetus to its plans to broaden its software expertise and offerings. This will also help to widen the company's export base. The computer consultancy division has executed several new turnkey projects at SEEPZ and abroad. The management's emphasis on packaged product marketing (Signbank and Easydeal software packages) and on turnkey projects should yield increased revenues in the near future. The division has also moved into higher value added markets such as CAD/CAM software. A major innovation has been the setting up of centres in India dedicated to software development for customers abroad. A beginning has been made in this area with the centres set up at SEEPZ, Bombay, for rendering software development services to Banque Indo Suez and Unisys CAD/CAM International.

The company has turned in good results for the 15-month period ended March 31 last. Sales have amounted to Rs 41.81 crore against Rs 25.94 crore in the previous 12 months and yielded a gross profit of Rs 5.29 crore against Rs 3.62 crore. Net profit is Rs 2.43 crore against Rs 1.55 crore. The directors have recommended a dividend of 27.5 per cent as against 22 per cent previously. The distribution is covered 2.02 times against 1.62 times.

Sales of B25 Super Micro Computers were made to some prestigious customers such as National Airport Authority, American President Lines, Bennett Coleman and Deutsche Bank, which together with certain smaller accounts resulted in sales of 188 B25s valued at Rs 3.20 crore. A large export order was procured from Yugoslavia for B25 Super Micro Computer Systems. The company is planning to introduce an expanded range of micro processor products to be manufactured at its factory in Goa. It is also widened its imported systems offerings considerably, consequent upon the Sperry-Burroughs merger. The company has arranged direct licensing of microsoft products to several large original equipment manufacturers in the personal computer market, which should yield significant revenues in the future. The company achieved foreign exchange earnings equivalent to Rs 35.75 crore during the period, whereas its imports of raw materials, sub-assemblies and components, capital goods and stores and spare parts were equivalant to Rs 1.30 crore and its expenditure on overseas business expenses, etc, came to Rs 12.08 crore.

DEEPAK FERTILISERS

Expansion Projects on Schedule

DEEPAK FERTILISERS AND PETROCHEMICALS has made satisfactory progress in implementing its projects for the manufacture of amonium nitrophosphate fertiliser, nitric acid, explosive grade ammonium nitrate and methanol. These projects, estimated to cost Rs 346 crore, are expected to be completed between October 1990 and March 1991. The company issued convertible debentures of Rs 218.50 crore to raise a part of the finance required for these projects. It is simultaneously

* 15 months, ** 16 months.

implementing an energy saving retrofit scheme for its ammonia plant, which is scheduled for completion by end-1990 and is designed to effect a reduction in the overall energy consumption by about 10 per cent. The company's proposal to manufacture polyacetal based on in-house availability of methanol is awaiting clearance. It also proposes to use its in-house carbon dioxide, presently vented to atmosphere, for conversion to 50 TPD liquid carbon dioxide/dry ice. These have many industrial and domestic applications and are currently in an acute short supply.

The company has produced encouraging working results for the year ended March with record production and sale of 95,309 tonnes and 98,666 tonnes of ammonia showing 21 per cent and 24 per cent increases respectively over the previous financial year on annualised basis. The company made a gross profit of Rs 16.24 crore against Rs 13.51 crore in the preceding 15-month period following sales of Rs 45.54 crore against Rs 46.02 crore. Net profit was Rs 6.94 crore against Rs 4.49 crore. The recommended dividend of 18 per cent was covered 2.51 times by earnings as against 1.70 times previously. The company expects to receive a sizeable refund from ONGC on account of the gas price difference between the price already paid at the rate of Rs 1,350 for fertiliser use and Rs 2,400 for non-fertiliser use right from December 1983 till the notification of the uniform gas price of Rs 1,400 by the government as a national policy effective January 30, 1987.

FINOLEX CABLES

Diversification Programme

FINOLEX CABLES has started production at its new plant at Urse, an industrially backward area of Maharashtra. The factory is provided with the latest machinery for producing jelly-filled telephone cable in foam/skin as well as in higher pairage. The company has signed a technical collaboration agreement with Norddeutsche Seekabel Werke, West Germany, for manufacture of high-tech special submersible cables. Equipment for fluoropolymer insulated cables is under installation and production is expected to start shortly. The company has also applied for a licence to manufacture chlorine, caustic soda and soda-ash which products will have a growing market. The objects clause in the company's memorandum has been amended to cover the diversification programme in the area of chemicals and petrochemicals.

Meanwhile, the company has fared very well during the 16-month period ended March 31 last with increase in turnover and profits. Margins have also looked up in spite of steep rise in prices of principal raw materials copper and aluminium. The weakening of the rupee along with its consequent effect on import duty also added to the rising cost burden. Mild price increases, wherever possible, helped to maintain the tempo of progress and profitability. Turnover amounted to Rs 106.24 crore against Rs 57.46 crore in the preceding 12 months and gross profit was Rs 29.13 crore against Rs 15.69 crore. Net profit came to Rs 19.02 crore compared to Rs 8.47 crore of 1986-87. The directors have recommended a final dividend of 40 per cent making a total of 60 per cent for the period on the capital expanded by a four-for-five bonus issue. Last year, the company had paid a dividend of 40 per cent. The distribution is covered 9.80 times by earnings as against 11.76 times previously.

The company's exports went up from about Rs 0.8 million in 1987 to over Rs 3.6 million. New export markets were explored and for the first time shipments were made to the USSR and telecom cables were exported to Zambia. Efforts to explore new markets continue. Expenditure in foreign currencies amounted to Rs 8.4 million.

FGP

Pressure on Margins

FGP has performed satisfactorily during 1988-89 although it had to contend with difficult trading conditions due to the excess capacity of glass wool in the domestic insulation trade. There was continuous pressure on margins of escalation of costs and reduced margins. Production and sales, however, increased in continuous filament product groups, with an optimum utilisation of capacity in the Thane factory. Several steps have been initiated to rationalise products and improve productivity.

The company has earned a gross profit of Rs 4.28 crore against Rs 4.17 crore in the previous year on a turnover of Rs 22.49 crore against Rs 20.24 crore. With both depreciation and taxation requiring lower provisions, net profit is Rs 2.65 crore (Rs 2 crore). Equity dividend has been raised by 2 points to 18 per cent which is covered 3.01 times by earnings as against 2.56 times previously. The company achieved exports of Rs 1.52 crore. Value of company's imports calculated on CIF basis was equivalent to about Rs 84 lakh and amount remitted in foreign exchange on account of dividend was Rs 23 lakh.

The company has signed an agreement with Owners-Corning Fiberglas Corporation, USA, for upgrading technology for continuous filament products under the foreign collaboration scheme. Initial steps have been taken to assimilate the technology package by a planned R and D programme. Continuous progress has been maintained in R and D activities which includes glass reinforced cement components for telecommunications and irrigation.

Pasupati Acrylon

PASUPATI ACRYLON is making a public issue of 108 lakh equity shares of Rs 10 each at par, aggregating Rs 10.80 crore. The company has reserved 5 lakh shares each for preferential allotment to UTI and Canbank Mutual Fund and 22.8 lakh shares for preferential allotment to NRIs. The company is putting up a plant to manufacture 12,000 tpa of acrylic fibre at Thakurdwara in UP in collaboration with SNIA BPD of the Fiat group. Pasupati Acrylon has been promoted by Mukesh Jain and the Pradeshiya Industrial and Investment Corporation of Uttar Pradesh (PICUP) is participating in the project with a share of 11 per cent in the equity capital. The capital outlay on the project is estimated at Rs 100.4 crore and is being financed through promoters' equity of Rs 20.1 crore, public equity of Rs 10.8 crore, term loans of Rs 48.5 crore and supplier's credit of Rs 21.1 crore. The company has estimated a turnover of Rs 73 crore for the first year of operation, at which level it expects a net profit of Rs 17.26 crore giving an earning per share of Rs 5.60. The company has already applied for enhancing its capacity to 20,000 tpa

The public issue opens on August 21 for NRIs and on August 28 for the Indian public.

Western India Industries

WESTERN INDIA INDUSTRIES is entering the capital market with a public issue of 10.75 lakh equity shares of Rs 10 each at a premium of Rs 7.50 per share. Out of the issue 1 lakh shares are reserved for firm allotment to SBI Mutual Fund Trustees, SBI Capital Markets, and 53,750 shares are reserved for preferential allotment to employees (including Indian working directors) of the company. The object of the issue is to finance the acquisition of fixed assets and to augment the company's long-term working capital resources. A sum of Rs 1.95 crore is proposed to be invested in fixed assets. Western India Industries specialises in the execution of turnkey engineering projects in the field of fire protection, water engineering and pollution control. In fire and safety systems, the company is associated with Total Walther of the Krupp group of West Germany. The company currently has orders in hand worth Rs 52 crore, including Rs 29 crore worth of exports/deemed exports. The company's total income for the 18-month period ended March 31, 1989 was Rs 19.11 crore compared to Rs 11.19 crore in the preceding 12-month period. The company declared a dividend of 37.5 per cent for the latest 18-month period compared to 20 per cent for the preceding 12 months. The company's net worth has risen from Rs 102.58 lakh as on September 30, 1985 to Rs 275.11 lakh at the end of March 1989. Earning per share has gone up from Rs 2.53 in the year ended September 30, 1985 to Rs 8.28 in the 18 months to March 31, 1989. BOI Finance and PNB Capital Services are the lead managers of the issue which opens on August 28.

SPCL

SUMITRA PHARMACEUTICALS AND CHEMICALS (SPCL) is making a public issue of 30.80 lakh equity shares of Rs 10 each at par aggregating Rs 3.08 crore. Out of the issue, 12.32 lakh shares are being offered for preferential allotment to NRIs on repatriation basis. Two lakh shares are being offered for preferential allotment to SBI Capital Markets and 2,07,500 shares to employees (including Indian working directors) of the company. SPCL has been licensed to manufacture 2,000 tpa of ibuprofen and 500 tpa of mebendazole. The company is setting up a plant to produce initially 300 tpa of ibuprofen and 50 tpa of mebendazole. The plant is coming up in Medak district in Andhra Pradesh. a notified backward area. SPCL is among the first to have adopted the swing plant concept in the pharmaceuticals industry which will enable it to manufacture not only ibuprofen and mebendazole, but also a whole range of essential drugs.

The project is estimated to cost Rs 6.15 crore and will be financed through promoters' contribution to equity (Rs 1.07 crore), public issue of shares (Rs 3.08 crore) and term loans (Rs 2 crore). Civil construction and erection of machinery are expected to be completed by November 1989 and commercial production to begin by the end of December. The main promoters of the company are Ramesh Jain, who will be the managing director, B D Jain and Suresh Kumar. The public issue is managed by SBI Capital Market, PNB Capital Services, Canbank Financial Services and State Bank of Hyderabad. The issue will open on August 24 for NRIs and on August 28 for the Indian public.

Lakshmi Motor Credit

LAKSHMI MOTOR CREDIT is entering the market with a public issue of 18 lakh equity shares of Rs 10 each at par for a total of Rs 180 lakh. Out of the issue 1 lakh shares have been reserved for preferential allotment to the employees (including Indian working directors) of the company. The proceeds of the issue will be used to finance a major expansion in the company's business, particularly in the field of hire purchase and leasing. The expanded capital base of the company as a result of the public issue will significantly enhance its borrowing power.The company is diversifying into financing of office automation and appliances besides substantial expansion of its existing financing business in regard to two-wheelers. The company belongs to the TVS group. The company's gross stock on hire rose from Rs 610.23 lakh as on April 30, 1988 to Rs 749.23 lakh as on March 31, 1989 and its leased assets from Rs 6.24 lakh to Rs 31.65 lakh. Its profit after tax was Rs 16.13 lakh for the 11-month period ending March 31, 1989 compared to Rs 11.81 lakh for the preceding 12-month period and it proposes to declare a dividend of 15 per cent for the latest 11-month period compared to 12 per cent for the preceding 12-month period. The issue opens on August 21 and is managed by SBI Capital Market and Champaklal Investment and Financial Consultancy.

Kartar Glass Works

KARTAR GLASS WORKS is making a public issue of 11.80 lakh equity shares of Rs 10 each at par for a total of Rs 118 lakh. Out of the issue 1.31 lakh shares have been reserved for preferential allotment to the employees (including Indian working directors) of the company. The company is setting up a project for manufacturing figured and wired glass at Kullewal in Hoshiarpur district in Punjab. The cost of the project has been estimated at Rs 721 lakh and is being financed through promoter's equity (Rs 70.50 lakh), equity participation by Punjab State Industrial Development Corporation (Rs 73.50 lakh), term loans from all-India financial institutions (Rs 444 lakh), central subsidy (Rs 15 lakh) and the proceeds of the proposed public issue (Rs 118 lakh). Construction of the project is complete and plant and machinery are under installation. Demand for figured and wired glass is expanding rapidly for use in commercial, industrial and residential multi-storeyed complexes and in the hotel industry. The project has been promoted by Amar Singh and his associates of the S K Glass group jointly with the PSIDC. Technical know-how is being provided by C V Chalam Consultants, Madras. The company has plans of diversifying into manufacture of sheet glass for which it has secured the government's permission. Industrial Finance Corporation of India and Punjab and Sind Bank are managers to the issue which will open on August 23.

Bourgeois Liberalisation Times

GPD

The rhetoric currently being employed in some socialist states would suggest that the free inflow of capital is not as dangerous as a free newspaper. No wonder American ideas are so dominant everywhere, for that is a typical American idea.

WE live in bourgeois liberalisation times. These are dark times. You open windows, but all kinds of insects make their way in. The trouble with these insects is that some of them are or tend to be counter-revolutionary rebels. One of the curious effects of bourgeois liberalisation is that the distinction between socialism and capitalism disappears. Windows let the insects in. They also let in a whole flood of private capital. Those who know how to tackle this situation have decided that they will let American capital in but will keep 'American' ideas out. The Americans had never achieved the glory that they have today. All ideas of freedom and democracy are supposed to be American. One would have thought bourgeois freedom would not be a dirty word, at least in this year of the bi-centennial of the French Revolution. The older books talked of socialist freedom as a higher term of freedom. Higher and lower forms of freedom can have different scope. A higher form of freedom would make much greater space available for discourse and exercise of freedom. A lower form of freedom would be narrower, constricted. The lower form may appear to be freedom incarnate but in reality it is not so. It may well be a form of repressive tolerance. One has to see its limited, narrow character and move to a higher form of freedom.

But then can you deduce from this that the lower form is antagonistic to the higher? Or that asking for a lower form of freedom makes movement to a higher form impossible? The rhetoric currently being employed in some socialist states would suggest that. Free flow of capital is not as dangerous as a free newspaper. No wonder American ideas are so dominant everywhere. For that is a typical American idea. The 'free world' is where there is free enterprise and free flow of capital. A free press is not necessarily part of the notion of freedom, either high or low. This is the reason South Africa is a part of the 'free world'. So is South Korea and so was Zia's Pakistan and Marcos' Philippines. The only difference is that the argument of those who govern these countries never was that they were building capitalism *because* they wanted to build socialism. Some people are however saying that they are letting a whole lot of insects as also capital come in because they are wanting to build socialism. It is possible to argue that the words are not altogether meaningless. A grammarian of ancient India said *saktam padam*, the word is powerful. The more controlled it is, the more powerful it is. So if any given leadership uses the word 'socialism' it would logically follow that what it is doing is *ipso facto* right and justified. This was the reason why Nehru said that he was building a socialistic pattern of society. This was also the reason why Indira Gandhi said she wanted to fight poverty. This is perhaps the reason why her not-so-illustrious son is talking of socialism, secularism and democracy. Deng Xiaoping is doing the same in China. Once you say that, the path to absolute power is clear.

Yet we live in bourgeois liberalisation times. In these times it is perhaps not very desirable to be banning newspapers. Nevertheless, there was one news item which evoked a mixed reaction in our heart. It is the news that Cuba has banned *Moscow News*. Normally banning anything does not help. More Muslims in India got to know, in summary fashion maybe, the contents of *The Satanic Verses* because the book was banned. Had it not been banned nobody, that is, only a handful, would have actually read the book. Indo-Anglian writing is a craze, but it is usually limited to books on the Raj and on the rather boring world of the NRIs. *The Satanic Verses* did not quite fit the bill. Even Shahabuddin has not read it. So banning a book (or a newspaper) is a way of making the book almost as tempting as a pornographic book. It then becomes a status-symbol to get hold of the book. Pornography does not have that status. Anyway, the Cuban ban on *Moscow News* was, therefore, a bit of a surprise. Yet one felt that here at last was a symbolic act, an act symbolic of protest against whatever has been happening in the socialist world in the name of socialism.

It is possible to look at the Cuban ban on *Moscow News* from two different perspectives. As an act of banning a magazine it is bound to evoke a mixed response. It would be interesting to know how Indian socialists react to a socialist state banning a magazine from another socialist state. It is not going to be easy taking 'a more Stalinist-than-thou' attitude in this regard. Because it would then be incumbent upon our socialists to stop reading *Moscow News* (they cannot obviously ban it). If they do not support Castro in his action it would imply their endorsement of *Moscow News* and its editorial policy. Of course, they can keep quiet on the question. They can ignore the Cuban indictment of perestroika and glasnost as they have done in the past. For some socialists life is indeed a bed of roses. The Soviets, in their view, are building socialism. So are the Chinese. So are the East Germans. And, naturally, the Cubans are not behind in any way. So the orthodoxy in country A and the liberalisation in country B are all contributing to the great socialist community of the future. It is capitalism which is in crisis. Socialism is as hale and hearty as one could imagine. God is in heaven and all is well with the socialist world (till such time as the succeeding leadership disowns its predecessor's view of socialism, but that is another matter!).

Yet the overall feeling one got was one of unhappiness that *Moscow News* had been banned in Havana. *Moscow News* may not be good socialism but it is interesting journalism. Imagine the socialists in China. They are studying Deng Xiaoping's June 8 speech for a few hours everyday. In addition almost every provincial paper is reproducing the speeches of the mayor of Beijing and the like. We are not for one moment suggesting that city mayors in China do not know their classics (whichever ones they are). But they are not necessarily exciting speakers. After all, the principle of *reeti* (style) cannot be brushed aside with contempt. *Moscow News* is evidence that Soviet journalism is coming of age. At any rate present-day Soviet journalists write in better style than mayors in China do. A socialist in China or in Cuba should be forgiven if he felt that *Moscow News* was more readable than the speeches of socialist mayors in China. They would have certainly asked for the removal of the ban (in Cuba) or for non-reprinting of the speeches (in China). If they don't do so it is because they know the hazards of living in bourgeois liberalisation times.

Delhi, the Imperial City

Arun Ghosh

Unlike other towns and cities of this country Delhi does not have to worry about where the money for its civic amenities comes from. There are some 800 million Indians to pay the cost of maintaining the nations show piece.

ALL daily newspapers published from Delhi (dateline, July 12) have a quarter page advertisement announcing that H K L Bhagat, union minister would be inaugurating the third of the twenty new flyovers to be constructed in Delhi to ease the traffic problem. Discussions are also under way about a metro rail system (in part underground) to ease the traffic problem of Delhi; a mega plan for the National capital region, covering areas currently as far away as Najafgarh in the west, Ballabhgarh and Pataudi in the south, Ghaziabad in the east and Sonepat in the north; plans are near final to ensure that the increasing number of citizens of Delhi are assured of every urban amenity and water is hereafter to be conveyed from the Ganga—apparently the waters of the Yamuna and the Hindon have long been fully utilised, and even the deep tubewells have exhausted groundwater availability—and augmented power supply would be made available by UP, Haryana and Punjab.

One cannot deny that the Delhi citizen is pampered. And why not? After all, the parliamentarians spend most of their time in Delhi, and most chief ministers (of Congress-ruled states) and some governors maintain residential bungalows in Delhi at great expense. So, Delhi must have an adequacy of water supply, the supply of subsidised milk, subsidised power, subsidised transport and all other civic amenities. The area served by the New Delhi municipal committee—where the elite live—must get about the cheapest power and water supply in the world, as well as the lowest local property rates (certainly in India, if not throughout the world).

These general advantages of Delhi are well known. And those who have had an opportunity to visit Delhi must have been impressed with its wide (and generally impeccable) streets, beautified pavements and carefully nurtured gardens and lawns, the number of luxury cars driven at great speed, swanky shopping arcades and widely stocked shops, and after sunset, an efficient street lighting system with halogen (or sodium vapour) lamps.

What is not known generally is that to maintain this beautiful face of Delhi, the rest of the country has to foot a hefty bill. After all, if the prosperous citizens of Delhi were to maintain the available civic amenities by paying for them, one would have no quarrel. But herein lies the essence of the problem. Unlike other towns and cities of this country, Delhi does not have to worry about where the money for its civic amenities comes from. There is a famous saying in Bengali: "You need funds? They will be provided by Gouri Sen" (meaning, the government, leastwise, somebody else). So it is with Delhi. You need to beautify Delhi? Why, there are some 800 million Indians to pay the cost; after all, the nation's capital must be a showpiece.

Consider the following figures of the total revenue and expenditure of 24 states during 1988-89, as given in the *Report on Currency and Finance* for 1987-88 (published by the Reserve Bank of India). The RBI does not, for some reason, mention the figures for Tripura; elsewhere in the report, the RBI does indicate that during 1988-89, the approved plan outlay for the state of Tripura was Rs 143 crore (against Rs 710 crore for Delhi). So, one can assume that Tripura's total budgetary expenditure would be considerably less than that of Delhi; and if so, out of 25 states, Delhi would be seen to have a higher total budgetary outlay than as many as nine states.

Admittedly, some of the states are small. But consider the population figures (as given by the 1981 census) and the capital outlay incurred by the different states and by Delhi; for it is through capital expenditure that we would be focusing on future growth (and thereby attracting the movement of workers and their families). Delhi, with a (1981) population of 6.2 million provided Rs 676 crore for capital expenditure in 1988-89. Assam (with an *estimated* population of 19.9 million, by the way, Assam did not have a census count in 1981) could only provide Rs 609 crore; Haryana with a population of 12.9 million, only Rs 471 crore; Jammu and Kashmir with a population of 6.0 million provided Rs 445 crore; Kerala with as many as 25.5 million could manage no more than Rs 477 crore; Orissa with a population of 26.7 million provided only Rs 672 crore. And though large states like Karnataka, Rajasthan, Tamil Nadu and West Bengal—with 1981 population of 37.1 million, 34.3 million, 48.4 million and 54.5 million respectively—provided more than Delhi did

TABLE: BUDGETARY EXPENDITURE OF STATES, 1988-1989
(Budgetary Estimates)

(Rs crore)

	Revenue Expenditure	Capital Expenditure	Total Expenditure	Total (overall) Deficit (−)
1 Andhra Pradesh	4078.5	908.4	4986.9	− 149.7

GoI: *Demands for Grants of Central Government*, 1989-90, p 97.

for capital outlay (Rs 917 crore, Rs 777 crore, Rs 759 crore and Rs 805 crore respectively), these provisions were only marginally higher than for Delhi, though each of these large states had a population seven to nine times that of Delhi. Take the last example—West Bengal, with nine times the population of Delhi—and comprising a difficult border state with diverse problems—provided Rs 805 crore for capital outlay against Delhi's Rs 676 crore.

I am not comparing the current expenditure of Delhi with that of the above states because the needs of administration need to take note of diverse needs and facets, including the *area* to be administered. Himachal Pradesh, for instance, has not only a large area, 56,000 square kilometres against 1,500 sq km of Delhi, but covers a most difficult terrain, large parts of which (Lahaul, Spiti and Kinnaur) are totally inaccessible during the winter and monsoon months. And Himachal Pradesh, with a population of 4.2 million (in 1981) managed to provide no more than Rs 197 crore for capital outlay, against Rs 676 crore by Delhi (for a population of 6.2 million).

But let us not confine ourselves to expenditure alone; some states are able to raise the revenue for large expenditures. So, let us see how much of the total outlay of Delhi is paid for by Delhi citizens. Here, the figures are difficult to segregate from central government receipts. Nonetheless, in the *Demand for Grants for Delhi* (Demand No 90) the recoveries—which are treated as a deduction in the budget, for purposes of expenditure approval—are shown to be no more than Rs 54 crore during 1988-89 (RE).

The central taxes collected and reimbursed to states also need to be taken into account. The total share of direct taxes payable to union territories (Delhi, Andaman and Nicobar Islands, Dadra and Nagar Haveli, Lakshadweep, Chandigarh and Daman and Diu) was Rs 58 crore in 1988-89; likewise, the share of central excises payable to union territories was Rs 32 crore. That makes a total of Rs 90 crore of which, let us assume, half was payable to Delhi (which is one out of six UTs, though admittedly the most important and prosperous). So, something like Rs 45 crore would be Delhi's share of central taxes distributed among states.

Between recoveries and the share of central taxes, thus, Delhi's revenue would be Rs 99 crore (or, say, around Rs 100 crore) in 1988-89. In that year Delhi had a total budgetary outlay of Rs 1,234 crore. Admittedly, purely local taxes by way of local sales tax and property taxes would also get collected; but then, it is by no means clear that these revenues are not used up by the Delhi municipal corporation, which has a separate budget of its own. It appears that Demand No 90 pertains to direct expenditures incurred *plus* subventions given by the centre, for Delhi.

It would, therefore, appear that something like Rs 1,034 crore was provided during 1988-89 from the central government budget, towards the current and capital expenditure of the Delhi administration. This appears to be over and above the sales and property taxes raised within Delhi, for otherwise these receipts would have figured under recoveries in the Demand No 90 in the central budget.

But this docs not exhaust the subsidy given to the citizens of Delhi by taxpayers from the rest of the country. The department of energy provides for the subsidy required for running the Badarpur thermal power station (which is one of the sources of power supply for Delhi); and for 1988-89, this subsidy (after taking note of Badarpur's receipts) came to Rs 157 crore. The net subsidy on the Delhi milk scheme (provided by the department of agriculture) was Rs 20 crore. One does not know how much of the outlay on Operation Flood (mother dairy milk supply)—amounting to Rs 99 crore—was for Delhi citizens. The non-plan loan to the Delhi Transport Corporation (to cover its operating losses) came to Rs 50 crore; another Rs 20 crore was provided (by the ministry of surface transport) as plan loan, presumably for the acquisition of new buses. There would be many similar subsidies—tucked away in the budgets of different departments/ministries of the central government—intended for Delhi citizens. Not counting these, that is, counting only the subsidy provided for the Badarpur power station, the DMS and the DTC, central subsidies amounted to Rs 227 crore, with another Rs 20 crore provided to the DTC for capital expenditure, making a total of Rs 247 crore. Thus, the total cost to the rest of the nation, for maintaining and improving Delhi, was a minimum of Rs 1,382 crore. If the subsidies from central departments other than the three specifically mentioned are added, the total would surely exceed Rs 1,500 crore for 1988-89. And this total has been rising.

It has, at any rate, been possible to identify Rs 1,382 crore (comprising Rs 1,234 under Demand No 90 *less* Rs 99 crore as recoveries and share of central taxes, *plus* Rs 247 crore in respect of only three units, the Badarpur power station, the Delhi milk scheme and the Delhi Transport Corporation) which is clearly financed by the rest of India for the convenience, comfort, indeed a high quality of life for Delhi citizens. Assuming the current population of Delhi to be eight million, this works out at some Rs 1,730 per capita per annum. This is considerably more than the total transfer of resources by way of taxes, duties and grants-in-aid—as per the Eighth Finance Commission recommendations—to all states other than Nagaland during the five-year period of the plan (see I S Gulati (ed), *Centre-States Budgetary Transfers*).

Of course, it is necessary to spend money to keep a nation's capital in reasonably good shape. For this purpose, large funds are spent by the CPWD (out of the budget for the ministry of works, as also now the ministry of urban development), as well as other authorities. These outlays have not been reckoned in the calculations given above; I have been concerned only with the transfer of funds to maintain and improve Delhi, and the subsidy provided for Delhi's electricity and milk supply and Delhi's metropolitan road transportation system.

But as a beneficiary of this central munificence, I find perfectly good roads resurfaced annually (in the areas frequented by VIPs), pavements dug up and beautified, dug up again and rebeautified, municipal property taxes brought down—yes, brought *down* rather than raised—when expenditures to maintain civic amenities and services in Delhi are steadily rising. (Incidentally, the electricity, water and property rates in the New Delhi municipal area are significantly lower than in the area administered by the Delhi municipal corporation). This situation is clearly something of an anomaly in a country where poverty alleviation is stated to be the first priority of the government.

But then, who is to question these developments when our honourable members of parliament are themselves anxious to increase the amenities available to Delhi citizens, even though they are supposed to visit Delhi only for purposes of parliamentary deliberations?

A final word. Successive emperors have made Delhi the capital city of their empires; and many have built their own cities and related edifices. There are, so the historian certifies, as many as 18 capital cities of Delhi, built at different stages. Most of them have vanished; the empires have crumbled. Should we not draw a lesson from the past? The rate at which Delhi is expanding, water shortage may, in the not toc distant future, force many to abandon Delhi. In any case, why should the rest of India pay for tapping the waters of the Ganga to meet the needs of the pampered citizens of Delhi?

Telling the World about Human Rights in India

A G Noorani

The Attorney-General's report to the Human Rights Committee was long on the letter of the Constitution and deplorably short on the actual state of human rights in India. The ministry of welfare's new brochure is another such attempt at disinformation.

THE Attorney-General, K Parasaran, had received quite a grilling a few years ago when he tried to fob off the members of the Human Rights Committee set up under the International Covenant on Social and Political Rights with a skimpy report which was long on the letter of the Constitution and deplorably short on the actual state of human rights in India. The members of the committee, to his discomfiture, had been thoroughly briefed and posed questions which reflected their awareness of the realities. Now we have another such attempt at what can only be called disinformation.

To commemorate the 40th anniversary of the Universal Declaration of Human Rights the ministry of welfare of the government of India has published a brochure entitled *India Marches Ahead towards Greater Attainment of Human Rights*. If you read it, you would not suspect that our country's otherwise good record on human rights is gravely tarnished by police torture, which is a norm, by custodial deaths, which are not so rare, by TADA, by preventive detention, by a host of statutes which curb freedom of speech and by rampant abuse of extra-constitutional power to intimidate the press—witness *The Statesman* and *Indian Post* cases.

In his 'message', with which the brochure begins, president R Venkataraman rightly observes that "development and economic growth, improvement in the quality of life and the standard of living can be meaningful *only when they are accompanied by the protection of these human rights*" (emphasis added). The secretary to the ministry, S S Varma, strikes the same note: "India has strongly emphasised that there is no choice between political liberty, economic development and social justice".

There follows, in page after page, a summary of constitutional and statutory provisions with, of course, claims of adherence to them in practice. Sample this prize piece: "The question of cruelty to prisoners is dealt with specifically by the Prisons Act. If any excesses are committed on a prisoner, the prison administration is held responsible for them." How often has this been done, pray. But read on: "Any excesses committed on prisoners by the police or jail authorities not only attract the attention of the legislators but that of the judiciary as well." True, the judiciary has been an enormous help. But not all cases even reach its doors. How many legislators take interest in these matters? And why is the press not mentioned at all? Quite often the judges have acted on the basis of exposures in the press and hauled up the authorities.

Next, have a look at another sample of falsehood—blatant and shameless: "The prisoners in *judicial* (sic) custody are extended humane treatment. *Indian jails provide prisoners with basic amenities and facilities for their rehabilitation*" (emphasis added). The brochure does not mention in the section on "Protection of Life and Personal Liberty" (para 8, pp 6-7) the permissible ambit of the law of preventive detention in Article 22 of the Constitution. Indeed this blot on our democratic system is itself mentioned *only incidentally:* "The scope of Article 21 (the guarantee of personal liberty) is so wide that even the law of preventive detention covered by Article 22 has to be in conformity with it." This is a disgraceful half-truth. For Article 22 permits, so explicitly, departure from the right to personal liberty that the right becomes almost meaningless in the face of the open sanction for imprisonment without trial.

Meanwhile on July 19, 1989 Amnesty International published yet another documented report on India which is entitled *Some Recent Reports of 'Disappearances'*. It has called on the government to clarify reports of seven 'disappearances' that took place during 1987 and 1988. The victims include Puran Singh, Shyam Singh, Veer Singh and Tilak Ram, who were reportedly arrested on April 10, 1987 in Uttar Pradesh as ordinary criminal suspects. Three others were 'political activists' who were arrested in mid-January 1988 on suspicion of involvement in political violence. Amnesty received eye-witness reports of these seven being taken away by police officers, some of them in plain clothes.

The report is a constructive and by no means denunciatory document. It contains this very fair acknowledgement: "It is to be emphasised that 'disappearances' are not frequently reported in India". Its concern is that the few cases that have occurred do not set a trend.

The report contains useful references to international efforts to stamp out the vice of 'disappearances'. It ends with the following suggestions which deserve ready acceptance:

> That the government institute speedy, impartial and independent investigations into cases of 'disappearances', including the seven listed in this report and inform the relatives of the findings without delay. Those carrying out the investigations should have powers to enforce attendance and co-operation of witnesses, to have the means to protect them and to make investigations on the spot and to obtain the records of law enforcement and security agents suspected of involvement in the case. In those cases where an independent inquiry has already been ordered to investigate cases of 'disappearance' —such as the cases which occurred two years ago in Meerut, Uttar Pradesh—the dozens of findings of the inquiry should be published in full and without delay.

This recommendation is in line with the urgent request by the United Nations General Assembly to governments to hold such inquiries in all cases of 'disappearance'. The report further recommends

> That the government ensure that in all cases where there is evidence that police or other members of the security forces were involved in or responsible for 'disappearance', they be prosecuted under the ordinary proceedings of criminal law.
>
> ... ...
>
> That the government order that fair and adequate compensation be paid to the relatives of those whom it can be reasonably assumed 'disappeared' because of abuses committed by the security forces.

In the case of the dozens of muslim men who 'disappeared' from Meerut, the Indian government has already granted compensation to the relatives, although, so far, it has not acknowledged that its security forces were responsible for their 'disappearance' and secret killing. But in the seven other cases described in this report, no such compensation has yet been given.

The report also suggests

> That the government ensure that all arrests and detentions are promptly acknowledged by those carrying out the arrests, who should be obliged to identify themselves. That the government also ensure that the family of an arrested person is immediately informed of an arrest, the reasons for the arrest and the place where the arrested person is held and that they be notified on any subsequent transfer.
>
> ... ...
>
> That the government establish or maintain public and centralised registers in all Indian states of all persons held in police stations, prisons or other detention centres, including the places where they are kept. The lists should be up-to-date and be available to family members, lawyers, magistrates and other interested bodies.

The importance of keeping detailed records of all arrested persons has also been stressed in the Body of Principles for the Protection of all Persons under Any Form of Detention or Imprisonment adopted by the UN General Assembly in 1988.

Mayhem in Devlia

Indranil Chakrabarti

Natabha was stoned to death, a huge boulder smashing his head. His elder brother succumbed to injuries the same day. The principal accused, sheltered by no less a person than the taluka panchayat pramukh, was arrested six days after the mayhem, and, in all probability, will be released soon.

CHOTILA block in the Surendranagar district of Gujarat is locally known as the 'Panchal' area. It is fabled that Draupadi was the princess of this region, which is the origin of her other name, 'Panchali'. Last month, while the nation watched B R Chopra's version of Panchali's 'swayamvar' on Doordarshan, the area of Panchal itself was in the throes of a grisly drama. On May 20, 1989, two brothers from the Gadhvi community were brutalised in broad daylight, in the Devlia village of Chotila for the singular crime of digging a well on their own land.

Studies on Gujarat tend to divide the state into four well marked natural regions: (1) the flat plains of the mainland extending from Daman in the south to Kutch and Abu in the north, (2) the highland region of north-eastern Gujarat, (3) the crescent-shaped Kutch, of mainly desert and waste land, and (4) the rocky, peninsular Saurashtra. With an average altitude between 75-150 metres and alternating with alluvial river basins, Saurashtra consists of coastal land, inland plains and central highland. Surendranagar, the landlocked northern district of Saurashtra, itself manifests considerable variations in its topography. There is the plateau in the north which connects Saurashtra with mainland Gujarat; the low lying, water covered portion in the east, called Nalkantha, the black soil Bhal region in the centre; and the Chotila (Panchal) area, surrounded by hills on all sides, where most of the rivers of Saurashtra originate.

Surendranagar, as indeed all of Saurashtra, was not part of the British India. What today constitutes Surendranagar, then comprised as many as 18 feudatory states, the smallest of which had only three villages, and an area of less than 50 square kilometres. Only in 1948 were these constituted into a district which within the then state of Saurashtra. Subsequently, this district along with the other districts of Saurashtra merged into Bombay state in November, 1956. After the bifurcation of the composite state of Bombay, it finally became part of the Gujarat state in May 1960.

Despite these and other changes, in many ways time has stood still in Surendranagar, as in so many other parts of the country, through the millenniums. It is by appreciating these continuities and changes that one can make sense of the happenings here, such as the ghastly killings in Devlia.

An old Gujarati proverb says that Panchal used to be mainly a grass land and the productivity of the soil was low. This holds true even today. Pastoral cattle raising and dry-land cultivation are still the principal economic activities of Chotila, as indeed of the district of Surendranagar as a whole. No doubt there is some well and canal irrigation and cash crops like cotton and oilseeds are grown; just as there are a few industries, viz, ceramics, and pharmaceuticals. But the gains from these have not reached the common people. Nor have they succeeded in bringing any dynamism to the economy, or the society at large.

The Darbars have been the traditional rulers of this region. In fact even after the British left India, this district was officially called Jhalawad, i e, the domain of the Jhalas, because Jhala is the most prevalent surname amongst the dominant Darbars in the district. Darbars continue to rule the district, though there have been some changes in the form, in keeping with the changes in the larger polity.

One only needs to cast a glance at the list of the key political functionaries of Surendranagar—the MP from the district is a Darbar; majority of the MLAs from the non-reserved constituencies are to be Darbars; the president of the district panchayat is a Darbar; a majority of the taluka panchayats are controlled by Darbars; even the headship of the various institutions in the district, be it the district co-operative bank, or, the district sale and purchase union, are held by the Darbars.

Economic clout is linked with the political. Some of the exploits of the ruling Darbars are legend. One such worthy is Balabhadra Singh Jhala. The local grapevine has it that his total landholdings would be upwards of 1900 bighas. To this one may add another 1000 bighas of 'vid' or pasture land. He himself however lives in Surendranagar town where he is the president of the District Education Committee; this puts him directly in charge of the 500-odd schools in Surendranagar, which include such responsibilities as appointments and transfers of teachers, admission and promotion of students, etc. Even an uneducated peasant in Surendranagar knows how these may be converted into economic and political capital.

Or take Kanubha Parmar who besides other things is also a contractor for public constructions. He holds the rare distinction of building a check dam four times in the last six years. It is said that on one of these occasions, for no fault of his, the dam was built somewhat stronger than the usual. Poor Kanubha Parmar had to actually use explosives to bring the dam down. Of course he was promptly granted the contract to build it again. This same Kanubha lost the last panchayat election of Muli taluka to a Koli. In the panchayat office itself Kanubha got him beaten up so badly that both his legs were broken. Threatened to death, the hapless incumbent resigned the next day. Kanubha since then has been the panchayat pramukh of Muli.

Or take Surubha, the nagar panchayat pramukh of Thangarh: He owns several illegal quarries in the same town, mining coal and fireclay. Besides this he collects a personal levy from every vegetable vendor who might come from the villages. At times this amounts to the poor farmer's entire earning of the day. Were a hapless poor peasant unable to pay, Surbha's men would forcibly empty his 'topla' on the street.

Most of Gujarat reeled under severe drought for several years. Surendranagar, which has traditionally been a low rainfall area, was the worst affected. It was the only district in Gujarat and amongst the only four in the whole of India, which had all its blocks declared as drought-prone. Where rainfed agriculture and cattle grazing still constitute the primary productive activities, the effect of such scourges of nature on the lives of the people need no elaboration. Horrendous stories of suffering of humans and cattle would regularly appear in even the national press, which otherwise remain virtually oblivious to these places.

No doubt there was considerable central and state assistance for relief. But the mighty have a knack of profiteering even more out of a calamity. To cite the instance of the same Balabhadra Singh Jhala, he was in charge of one of the scores of cattle camps set up in this region to save the bovine population from dying for want of water and fodder. The government provided relief at the rate of Rs 3 per cattle per day. While Balabhadra Singh Jhala showed records for upwards of 8,000 cattle, taluka people say that the actual number entertained would never exceed 3,500.

Thus this worthy, on whom the responsibility for the education of the entire district is vested, would have made easily anything between Rs 15,000 to Rs 20,000 per day from one cattle camp alone. Add to this the clout gained through what is wont to be perceived as personal patronage. Of course this is not unique to Balabhadra Singh or for that matter to even Surendranagar. Corruption

in cattle camps and other relief works was for long the favourite stick of the opposition parties, as well as the Congress(I) dissidents, to beat the resilient Amarsingh Choudhury's ministry.

With the ruling Darbars gravitating to the taluka, district and still higher levels, there is a vacuum at the village level which is increasingly being filled by lumpen elements. Indeed lumpenisation is an integral aspect of such a political economy. The economy which has remained static for ages, can hardly accommodate the subsistence needs of the growing population. Leave alone the craving for higher standards, from the exposures to lavish lifestyles through the media and otherwise. Unless more productively harnessed, this is bound to lead the more militant to lumpency, which in fact is patronised and nurtured by the ruling elements, to retain and entrench their political and economic might.

Naturally such a situation would be bloodied with skirmishes and feuds, and indeed that is the case in not only Surendranagar but also other parts of Saurashtra. In many ways, what happened in Devlia is part of this same reality.

Events in Devlia

The Aga Khan Rural Support Programme (AKRSP), a voluntary organisation within the fold of the multinational Aga Khan Foundation under the patronage of the Imam of the Shia Ismaili Muslim sect, has been active in the Chotila block of Surendranagar district for sometime. Headed by the erstwhile secretary to the ministry of agriculture and rural development, Gujarat, Anil C Shah, AKRSP proclaims itself to be a 'catalyst for rural development in India'. Typically it would take up activities like minor irrigation, watersheds, afforestation, etc, in selected villages. In the drought year of 1986, AKRSP initiated the renovation of the existing percolation tank in Rupavati village, adjoining Devlia through the government's drought-prone area programme (DPAP). The objective was to provide immediate employment to the drought-stricken people, as well as to help raise the water level in the wells in these villages. The work was completed by the summer of 1988, and with the good rains that year, possibilities of well irrigation were bright.

From the beginning, the Gadhvis, a peasant caste, which constitute only about half a dozen of the 30-odd families in Devlia, were enthusiastic about AKRSP's activities. But this also incurred the wrath of a section of the Bharwars, a militant caste traditionally engaged in cattle rearing and grazing. One such family was that of Khengar and his father Bhura.

Even during the renovation work, there was some antagonism over the sacking of Khengar from the chowkidar's post because of his alleged pilferages. But the real rub came when their monopoly over the irrigation canal system came to be questioned. Khengar and Bhura would demand and receive an illicit personal tax from the villagers, for every watering from the canal. This was over and above what the users would need to pay to the irrigation department. The Gadhvis refused to pay this extortion sum in 1988.

Then came the panchayat elections in February 1989, where Jaganag, another Bharwar, was the leading candidate, along with his cronies. But the Gadhvis got together with the majority Kolis, another peasant caste, and managed to get four of their candidates elected. Jaganag himself was defeated in the contest. Now Jaganag, 30, is typical of the new power brokers in these villages. He is known to be the henchman of the panchayat president of Chotila taluka, Moti Heera, who is also the chairman of the milk co-operative union of Surendranagar district. Moti Heera is notorious in the area for his illegal quarrying activities and general hooliganism. They say in Chotila that his reach extends up to the chief minister. Jaganag himself had organised a cattle camp in the drought year of 1987, and made good money, though not on the same scale as his patrons at the taluka and district levels. He is also in the other lucrative business of contracting for public construction works.

Meanwhile, AKRSP found that despite the raised ground water level because of the renovated percolation tank and a good monsoon, most villagers were so cash starved that they could not derive any benefits. They had no money to dig wells to tap the ground water table, nor, for good quality seeds and other inputs. Of the 30 village co-operative societies in Chotila, which are supposed to provide credit to farmers, as many as 29 are defunct. This is partly because of the severe drought, owing to which farmers could not pay back any loan, especially, since 1982. But the main reason is that most of the farmers were victims of manipulation by the presidents and secretaries of the societies who took advantage of the illiteracy of the farmers. Being defaulters, banks would not lend them any money either. The only alternative is the private moneylender, who of course charges usurious interest rates as high as 120 per cent.

Therefore AKRSP introduced its credit scheme, whereby, groups of at least five farmers could take loans from them, with the obligation that each one of them should repay before the next season to be eligible for fresh loans. In Devlia village, a group, comprising predominantly the Gadhvis, came forward to dig a well for irrigation.

Jaganag demanded a sum of Rs 5,000 for himself before they dug wells on their lands. He also personally went to AKRSP's local office at Chotila town with the warning that the consequences of their 'development' activities could be serious. Hardly equipped to deal with such threats the local office could only send a detailed note to Anil Shah at the Ahmedabad head office describing the tension that AKRSP's activities could cause in the village, along with personal sketches of Jaganag and a few other 'dadas'. Based on this Anil Shah sent a note to the district collector at Surendranagar. The Gadhvis did not pay Jaganag his personal levy. Instead, they went ahead with their well, and on May 19 actually found water at the nominal depth of 14 metres.

The reprisal was quick to come. The next afternoon as these Gadhvis started for home for food, they were ambushed twice with murderous assault. Nathabha, 24, was thrown inside a well only 200 metres away from the one where they had struck water the previous day. He was then stoned to death by the Bharwars, standing at the top of the well. Jaganag himself delivered the fatal blow with a huge boulder, which smashed Nathabha's head beyond recognition. The killing party included Khengar and Bhura from Rupawati. Nathabha's elder brother Amrabha, 27, died the same day from the kulhari (axe) and lathi (stick) blows in his head and other parts of the body. Their father, Jethabha, is still critical at the Rajkot hospital. The others were recuperating from injuries of various degrees.

The principal accused, Jaganag, sheltered by no less a person than the taluka panchayat pramukh, Moti Heera, could be apprehended only six days after the mayhem. Indeed, when two days after the incident, the district collector, along with Anil Shah, visited Chotila, one of the first persons to meet them was Moti Heera, with Jaganag in tow. The terror in Devlia village, and especially among the six Gadhvi families each one of whom has at least one victim from the assault, can be gauged from the fact that the only person who was prepared to give a statement against the murderers was ten-year old Nanben, a cousin of the two brothers who were killed. Apprehension

NOTICE

LARSEN & TOUBRO LIMITED

It is hereby notified for the information of the public that **M/s. Larsen & Toubro Limited** propose to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under:

1.	Name and address of the applicant	: **LARSEN & TOUBRO LIMITED** Registered Office: L & T House, Ballard Estate Narottam Morarjee Marg, Bombay 400 038
2.	Capital structure of the applicant organisation	: As on 31.3.89
	Authorised Capital	: Rs. 75,00,00,000
	Issued Capital	: Rs. 60,74,88,440
	Subscribed Capital	: Rs. 60,74,88,440
3.	Management structure of the applicant organisation indicating the names of the directors, including managing/wholetime directors and manager, if any	: The company is managed by the managing and wholetime Directors subject to the supervision and control of the Board of Directors
	Names of directors:	
	1. Mr. D.H. Ambani	– Chairman
	2. Mr. M.D. Ambani	– Vice-Chairman
	3. MR. U.V. Rao	– Managing Director designated as Chief Executive Officer
	4. Mr. S.R.R. Subramaniam	– Managing Director designated as President
	5. Mr. D.L. Pradhan	– Wholetime Director designated as Vice-President
	6. Mr. S.P. Kashyap	– -do-
	7. Mr. C.R. Ramakrishnan	– -do-
	8. Mr. S.D. Kulkarni	– -do-
	9. Mr. M.P. Wagh	– -do-
	10. Mr. Y.H. Malegam	– Director
	11. Mr. R.M. Gandhi	– -do-
	12. Mr. Klaus Henseler	– -do-
	13. Mr. A.S. Gupta	– -do-
	14. Mr. S.E. Dastur	– -do-
	15. Mr. S.S. Marathe	– -do-
	16. Mr. S.N. Shende	– -do-
	17. Mr. M.L. Bhakta	– -do-
	18. Mr. A.D. Ambani	– -do-
	19. Mr. N. Ganga Ram	– -do-
	20. Mr. A. Binder (Alternate to Mr. Klaus Henseler)	– -do-
4.	Indicate whether the proposal relates to the establishment of new undertaking or new unit/division	: The proposal relates to the establishment of a new undertaking which will be a part of Larsen & Toubro Limited
5.	Location of the new undertaking	: Malanpur Growth Centre, Tehsil–Gohad; District–Bhind, Madhya Pradesh
6.	Capital structure of the proposed undertaking	: Same as that of the applicant organisation
7.	In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:	
	i) Name of goods/articles	: OTS Cans and printed metal containers
	ii) Proposed Licensed Capacity	: 40,000 tonnes
	iii) Estimated Annual Turnover	: Rs. 146 Crores
8.	In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc.	: Not applicable
9.	Cost of the Project	: Rs. 55.5 Crores
10.	Scheme of Finance, indicating the amounts to be raised from each source	: Rs. Crores
	i) Term loans/Debentures/Foreign currency loans	: 37.0
	ii) Internal Generation/Equity Issue	: 18.5
		55.5

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Sd/-
S.D. KULKARNI
VICE PRESIDENT (FINANCE)

Dated this 7th day of August, 1989.

about her safety was writ large on her parent's face, and even the DSP, Yadav, the chief investigating officer, admitted that this crucial eyewitness was in some danger. Though Jaganag has now been finally put behind bars, perhaps because of the not inconsiderable influence that AKRSP wields with the powers that be, the grapevine has it that he will not remain there for long, especially given that this is also the election year.

How has the media reported this episode? *Phool Chaap*, a Gujarati daily from Rajkot, carried it as a routine occurrence in a small snippet: "In a fight between Charans (gadhvis) and Bharwars two were killed and four injured...." *Jai Hind*, another Gujarati daily from Rajkot, dished out the entire story as a family and caste vendetta against the liaison between Amrabha and Jaganag's sister, giving juicy details of the relationship, and little else. None of the dozen and more dailies from Ahmedabad found this gruesome killings in the land of the "messiah of non-violence", even newsworthy.

Anil Shah, the experienced chief executive of AKRSP, is also an occasional columnist. His latest piece, 'Where Angels Fear to Tread', written some days before this incident, extols his organisation's credit scheme as introduced in Devlia. Contrasting it with the shoddy performance of the government, his previous employer, it concludes, a trifle vainly, "Perhaps AKRSP is rushing in where the wise planners of our country have not ventured to tread". Words, which in retrospect, sound rather prescient, albeit unwitting.

To those familiar with Gujarat's 'development activism', the Devlia killings might remind them of the massacre in Golana, enacted three years ago, on the Republic Day of this sovereign, socialist secular democratic republic. There it was the Behavioural Science Centre, a Jesuit voluntary organisation, which had in all innocuity sought to distribute a little common land to several low caste Wankhars through a government scheme. Four of the Wankhars were gunned down in broad daylight by the dominant Darbars. Of the 21 injured, several have been disabled permanently.

The question, is whether Golana and Devlia might provide any lesson to the poor and the oppressed of Gujarat, and to those genuinely concerned about their upliftment. One perhaps is that Gujarat after all might not be so removed from the social fabric of which Karamchedu or Daltonganj are part. Also perhaps, that the answer to the plight of the people of Gujarat does not lie in mere managerial and technical inputs to the countryside, no matter how efficient and well-intended these efforts might be. Perhaps there is no deliverance for Gujarat until its toiling people heed the clarion call of its most illustrious poet, Jhaverchand Meghani—who, incidentally, was born in Chotila—and strive together to usher in a new democratic society of his dreams.

Promotion of 'Modern' Technology
A New Tool for Neo-Colonialism

Dinesh Mohan

The acceptance of the ideology of technology leads us to two different kinds of simplistic options. One, to move towards recapturing a storied pre-colonial cultural glory shored-up by various obscurantist beliefs. And, two, to participate in the game of catching up with the west. Most nations in the non-communist third world play a schizophrenic game with both these options together.

IS the slogan "leap-frogging into the 21st century" really as apolitical in approach to development as it is made out to be? Will it spur the young people of India into working toward an environment that encourages innovation, hard work, sacrifice and even dreaming? Where has this new ideology emerged from?

In the colonial period, when nations projected their supremacy it was in terms of military might and scientific machismo. The military might frightened colonial peoples into submission and the scientific achievements of the oppressors convinced the oppressed of their own 'innate' inferiority. As a result, the colonised even felt it necessary to explain their religions and rituals in terms more relevant to the religion of their oppressors—Christianity. In nineteeth century India, for example, there were Hindu and Muslim reformers (e g, Raja Ram Mohan Roy, Vivekanand, Syed Ahmed Khan) who found it necessary to rationalise their religions and make them look 'respectable' before western Christian scrutiny. So the dominance of the west encompassed all aspects of human thought and action in the early part of this century.

Within fifty years, however, most parts of the world achieved political independence and many newly formed nation states made tremendous efforts to assert their independence and self-reliance. The west now had to evolve new ideologies of domination which would appear to be politically neutral. The most effective new form of domination they found was technology—technology as an ideology. And almost helplessly, most of us in the third world have fallen into the trap of conceiving and portraying our goals in terms of new technologies and successes in 'fundamental' research.

Technology As An Ideology

Technological development and the directions basic research takes are intricately linked to the self-perceptions and goals of a society's influential bourgeoisie. Thus much of the technology developed in the west today must automatically be designed for the middle-classes with a great deal of leisure time on their hands. This is the science and technology which we in the third world have come to regard as 'modern'. And, by extension, the evolution of these technologies and research associated with them have now become, for us, the only tests of any nation's viability for the future. Thus we end up measuring our own future prospects purely in terms of our ability to cope with these 'emerging' technologies and our perceptions of their role in the 'Information Age'.

The acceptance of this "ideology of technology" leads us to two different kinds of simplistic options. One, to move towards recapturing a storied pre-colonial cultural glory shored-up by various obscurantist beliefs. And, two, to participate in the game of catching up with the west. Most nations in the non-communist third world play a schizophrenic game with both these options together.

At one level we have a very *real* fear that we will never be able to 'catch-up' and this makes us resort to re-defining rules of our own which would automatically make us morally superior. So we can go 'Yankee-bashing', riding our spiritual high-horses.

> ... it is as if Feri and the doctor, turning away from the life of intellect and endeavour, have come together in an Iranian death pact. In the emotions of their Shia religion, so particular to them they will rediscover their self-esteem and wholeness, and be inviolate. They will no longer simply have to follow after others, not knowing where the rails are taking them. They will no longer have to be last, or even second. And life will go on. Other people in spiritually barren lands will continue to produce the equipment the doctor is proud of possessing and the medical journals he is proud of reading. That expectation—or others continuing to create, of the alien necessary civilisation going on—is implicit in the act of renunciation, and is its great flaw (*Among the Believers*, V S Naipaul).

These simplistic notions and obsessions are by no means peculiar to some Iranians. The believers' need for belonging and their yearning for a purer past are common characteristics of the religious and jingoistic chauvinist groups in India also. That is why the decision makers in India have to keep

repeating the need for 'spirituality' when they promote modern technology.

Many third world nations are highly plural societies made up of groups with different languages and cultural identities. The result of technological insecurity in such societies is to encourage a single dominant group within the society to force its own concept of purity onto the other groups. This is certainly one of the many important factors fuelling ethnic tensions in third world nations.

On the other hand, when our other self pushes for catching up, then we coin slogans about "leap-frogging into the twenty-first century". On the face of it this slogan gives the impression of being very secular and pushing for a dynamic fast moving society. What it really does, however, is justify and deploy what are extremely non-egalitarian forces for change.

The initial step in this is making 'modern' synonymous with 'western'. We end up defining progress as the acquisition and production of 'modern' goods—'modern' not being what *we* need *tomorrow*, but what the west produced *yesterday*.

The next step in the process towards increased inequality comes when we apply this perception of 'modernity' in an unequal society to the the task of development. Consider the education sector: once we have decided that 'catching-up' and participation in all the so-called 'emerging' or 'frontier' areas of research are our main concerns we have automatically elected to ensure that at least a few citizens in an unequal society be singled out for special treatment. This is done by promoting the following:

— at least a small number of boys and girls get 'good' primary and secondary education in expensive schools regardless of what happens to everyone else;
— there exist a few elite institutions of higher learning which follow curricula identical to those in the west;
— research priorities be set independent of the society's actual productive needs;
— education process be long and expensive;
— our educational policies follow a triage management style normally reserved for the battle field. Specifically: (a) only those who can compete with the western intellectuals be given the maximum priority at all levels of education, (b) those who can help these contestants be given the basic minimum survival opportunity, and (c) those who have no chance of participating in this endeavour be left to fend for themselves.

This scenario is not abstract. The educational establishment in India has largely functioned along these lines for some time now. The fact that so many left to fend for themselves manage to survive speaks volumes for the tenacity and the genius of the abandoned people. The recently announced New Education Policy in fact formalises this triage concept by proposing one model school per district (with a population of usually over a million), enhancement of funds for elite institutions, and ensuring research in 'frontier areas'.

This also suits local technocrats because only a few of them can become knowledgeable in the specific fields of endeavour and are thus exempted from facing real local challenge or competition. The mark of approval for their competence can *only* come from the western centres of knowledge. These western judgments, in turn, naturally get coloured too by the western nations' political policies of influence and domination along with their natural feelings of condescension towards the third world. So, at times, charlatans serving the interests of the foreign masters cannot be taken to task by local critics since 'greater' authorities from the outside come to their defence.

These policies also make it possible for mainly the elite of the third world to cross national boundaries in search of professional employment. They think of themselves as international beings and have little stake in the success or failure of policies at home.

In the final analysis, however, this mad rush to establish enclaves of excellence based on outsiders' definitions and priorities ends up being its own booby-trap. Since these policies do not involve participation of all people, we cannot select the best from our populations. So this lopsided selection process ends up sending many intrinsically mediocre and complacent people to our best centres of research, and excellence continues to elude us.

Unfortunately, when we adopt "technology as an ideology" we also set in motion many other forces detrimental to our societies. For example, when any local group opposes a large technological project on humanitarian grounds the concerned group can very easily be dismissed as anti-progress or even anti-national. The proposal for setting up a testing range at Baliapal in Orissa and the bulldozing of the Narmada Valley Project are good examples of this tendency. Similarly, the poor and the disadvantaged are now easily viewed as impediments to progress. The elite also comes to view any ideology aimed at a more equal income distribution as coming in the way of the acquisition of a few more technological toys. A fancy international airport is naturally preferred to a more efficient city bus system. Ultimately, because the poor are seen as obstacles to modernity even they can be as anti-national!

More alarmingly, 'the poor' are often not all that ethnically neutral in old composite societies. The poor in many societies are also members of minority communities. This ethnic angle to poverty makes it fairly easy for a dominant community to label the minorities, as communities, as anti-science and anti-progress. Thus, technology as an ideology also gives the majority a secular whip to hit the minorities.

In the preceding paragraphs I have tried to analyse how the pursuit of technology as an ideology in fact influences political and socio-economic directions for our societies. I have also argued that in the name of technology a non-egalitarian political direction is taken without an overt statement to that effect.

Role of the Youth

In my interaction with young people around the country over the past few years I get the feeling that they are suffering a tremendous loss of hope. There is little sense of pride in anything we do now. All pride is in a mythical past. This certainly cannot be blamed on them. It is my impression that this has happened because science is being sold as a commodity and not viewed as a part of our process intricately linked with the social and cultural movements of our civilisation. Secondly, we keep setting our goals and aspirations to achieve targets set by those in the west instead of aiming for things which are doable and appear to be obviously for the good of the majority in this country. This automatically makes people lose hope and be certain of failure.

When our leaders talk about science and technology they project inventions and end products, and the media highlight sexy new concerns of the west like AIDS, superconductors, test-tube babies, genetic engineering, etc. This attitude has filtered down to the young. In a national essay competition for high school students one of the topics given was "Science is Fun". While evaluating the entries it was astonishing to find that almost no one talked of science as a process, as a way of thinking. Almost all the boys and girls used the word 'science' interchangeably with computers, videos, Boeing 747s, satellites and nuclear weapons! On further thought one realised that these young people were only reflecting the attitudes of our present leaders in India. A remark by the minister justifying the brain drain from India as establishing 'brain banks' abroad gives a signal to the young that electing to work in their own country is not given any importance now.

The Future

It is the understanding of the process of science and technology which has been completely subverted in India, especially in the past seven or eight years. Every one knows that good novels are not written just by collecting the most difficult and newest words from a dictionary and then ordering a linguist to arrnage them well. But this is the method our leaders have chosen to promote science and technology in India: Select the 'latest' problem and concerns of the west, buy the expensive foreign equipment that goes with them, identify 'top-ranking' professionals, arrange foreign collaborations and then command them to do 'good' science in 'frontier' areas.

By giving science and technology this

value-free exalted position, and by behaving as if this had nothing to do with political biases and social distortions the people in power are trying to put themselves beyond democratic control. If science is presented to the people as a purely 'technical' matter, without any social or political implications, there need be no public discussion of scientific and technological policy decisions. Free enterprise and *laissez-faire* policies can be ushered in much more easily. It is therefore not surprising that a large number of the seniormost policy makers in India today are either ex-employees of organisations like the World Bank and the IMF or have very close associations with them.

If third world societies want to survive with self-respect, and if we want to move towards more human systems we have to expose the *political* nature of these so-called technological policies. In addition we should be able to design and propose alternative political ideologies and socio-economic systems which are based on clearly stated human goals and not on the acquisition of technological artefacts.

To achieve this alternative society we have to think of different electoral processes which ensure representation but reduce the influences of powerful lobbies like large business houses and multinational corporations on the electoral processes. These systems will have to move away from the idealised concept of two political parties and homogeneous populations. The new political structures and ideologies would have to build in systems which automatically reduce the influence of the dominant power centres around the world.

It is possible that as we move towards these newer structures we may be able to deal with *uncertainty* more confidently, and not depend on solutions taken from the west. We have to realise that some of our traditional ways of understanding reality are just too slow and we may not be left with any choice to make unless we use all possible tools of thought to design and shape our future.

We have to discover newer ways of doing things and producing things so that we can exchange goods with each other on more equal terms. To do this we have to design working systems for scientists which suit our cultures better and allow the average scientist to function more productively. We have to realise that political systems which work well in the US tend to "reverse their phase" when implemented in third world countries. That is, many systems which function as democratic processes there, become oppressive when transplanted here. The same could be true for science systems also.

It is time to look *inwards* and define the future in non-technological terms. Once we do this, independent science and technology policies may follow more naturally from the non-technological choices we make, and give us an escape hatch from the present determinism exercised on us by "technology as an ideology".

Sowing the Seeds for a 'Biorevolution'

Mahinda Seneviratne

Policy-makers and scientists in the third world can no longer afford to be naive about the political significance of biotechnology and need to pay close and careful attention to the World Bank's initiatives to sow the seeds for a new biorevolution in the third world.

SUSAN GEORGE, author of *How the Other Half Dies*, recently warned that "the new biorevolution in agriculture will be characterised by new and stronger forms of dominance and manipulation" than the external controls that dominated the Green Revolution in the past. Those who have taken a critical look at the impacts of the Green Revolution upon third world people, have shown how the efforts of the World Bank, the International Centres for Agricultural Research (ICARs) and agencies such as the Rockefeller Foundation facilitated the multinational chemical corporations to be closely linked with the agricultural production chain in the third world.

Recent initiatives by the World Bank to bring the new biotechnologies into third world agriculture raise a number of concerns for people in the developing countries. Over 100 development policy-makers, economists and some third world scientists and representatives from aid agencies and transnational corporations met for a seminar in Canberra in May 1989. Organised by the World Bank and International Services for National Agriculture Research (ISNAR), and supported by the Australian aid agency AIDAB, the gathering aimed to identify ways to bring advances in biotechnology for application in third world agriculture.

Shadow of Privatisation

Biotechnology has many applications that have much potential benefit for agriculture in the developing countries. These range from improvements in yield and quality in crops, to genetically manipulating plants so that they resist disease and tolerate various stress and inhospitable environments. But the extent of privatisation of the new technological developments looms as a shadow over these prospects. The growing ownership of research, development and the resulting products by a few transnational corporations shows a widening web of control by a powerful few.

Henk Hobbelink from the Brussels-based International Coalition for Development Action (ICDA) has shown the extent of involvement in biotechnology by the world's leading chemical companies like Shell, Monsanto, Ciba-Geigy and Sandoz. He says that "exactly the same TNCs that already control the pesticide and pharmaceutical market... are now the most active in the field of biotechnology". Furthermore, all ten leading producers of agrochemicals are also engaged in the seed sector and control 80 per cent of it. With their focus on research to develop seeds that are genetically manipulated to tolerate particular pesticides—the company's own, that is—the link between the paths of research and market control are not difficult to see.

The genetic diversity of the large gene pool in the third world has greatly benefited modern crops in the industrialised countries. Most of the world's genetic pool come originally from the developing countries, and sometimes the economically poorest nations are the richest sources of diverse genetic material. For example, the world's leading hybrid grain sorghums were derived from native sorghum of Ethiopia and Sudan. Today, as much as 90 per cent of the genetic resources in the International Bank for Plant Genetic Resources (IBPGR) have come from the third world. Of these 40 per cent are in the hands of Europe and North America while another 40 per cent are stored by the ICARs. The growing TNC control of the seed sector, worth US$ 13 billion annually, do not allay the fears of the developing countries who have only 15 per cent of their own genetic resources in third world gene banks.

Thus it was no surprise that the most contentious issue at the Canberra seminar was Intellectual Property Rights (IPRs). The attempts by the US, EEC and Japan to use economic muscle to 'trade-off' the third world's IPRs at recent discussions in the General Agreement on Trade and Tariffs (GATT) and at the World Intellectual Property Organisation (WIPO) affect biotechnology too. The lack of adequate patent control legislation in developing countries is often claimed in the arguments, but this, in turn, has not deterred many private corporations and individuals from virtually 'looting' some of the third world's genetic resources for profitable ends.

Gateways for Private Sector

The World Bank perceives a passive transfer of some of the currently developed biotechnology applications to the developing countries. The ICARs and other leading players of the Green Revolution are destined to take a major role again. According to a World Bank consultant, "the ICARs could be the 'gateways' for the private sector to enter into joint ventures with the least developed countries such as Bolivia, Nepal and Burma". This raises two crucial concerns. The extent of control by the TNCs would give them unforeseen power that can only strengthen their corporate interests in these aid-dependent nations. Meanwhile, most of these countries which lack the basic infrastructure for biotechnology will only be recipients of an unequal transfer.

At a time when education services have become a lucrative commodity, much attention is being given to educating and training personnel from the third world in institutes in the developed countries. While this is seen as providing an opportunity for the third world countries to develop their own infrastructures over the years, one wonders why such enthusiasm by the rich nations was conspicuously absent in recent years. During the struggles to establish the International Centre for Genetic Engineering and Biotechnology (ICGEB) for similar purposes by UNIDO, none of the major industrialised countries showed any interest to support third world access to biotechnology capabilities.

Joe Gopo of Zimbabwe University pointed out that what the third world needs is "acquisition" of the biotechnologies and not simply technology transfer. This may not be exactly what the World Bank policy-makers or the transnational corporation representatives perceive for the developing countries, but fortunately, some scientists and international agencies have already begun to look in that direction.

Even if the third world gains adequate access to today's array of biotechnology developments, most of them would be inappropriate to their specific needs. The history of technology shows that its pathway is often charted to serve the interests and needs of those who own and control it, and the biorevolution is no exception. Attention was focused in Canberra on the so-called 'orphan' commodities such as cassava, banana, coconut, spices and tropical fruits. They form a large part of many third world people's diet, but are ignored by the concentration of research on major crops. Alan Kerr of Australia's Waite Agriculture Institute said that biotechnology developments that are being applied to these commodities may take from five to ten years, but "will be simple and cheap and within the grasp of

many developing nations' capabilities—unless of course the TNCs grab them, too". A crop scientist from Zimbabwe estimated that the economic benefits to the country from research done to improve the commercial crop cotton alone will be at least $ 20 million annually. That is, he believes, if the country can develop a local base such that "at the end of the day we are not dependant on the goodwill of the private companies".

IMPACT ON RURAL POOR

On the other hand, some of the crops focused for research by the developed countries will replace some third world nations' primary export commodities. This is already becoming evident with the impact of high-fructose corn syrup in the sweetner industry on sugarcane producers, and the production of natural gum and vanilla beans in US laboratories upon farmers in Sudan and Madagascar respectively. Serious implications await third world producers of cocoa, oil palm and other export crops from developments arising out of tissue culture techniques. The wider social and economic impacts of these are expected to largely affect poor farmers and rural workers in the third world.

Ifthikar Ahmed from the International Labour Organisation (ILO) cites the example of a large-scale displacement of predominantly female labour employed for weeding, if the TNCs' herbicide-linked seeds are introduced to third world farms. Such social as well as the environmental impacts of the 'biorevolution' have fortunately been identified early, but major players like the World Bank and TNCs have shown little attention to them. This was evident in Canberra, where these issues were played down, and the absence of participation by 'grassroots' organisations such as farmers' unions, development groups, consumer interests and other relevant third world bodies was conspicuous.

There is a scramble for world markets for agriculture produce between the US, EEC and other major producers like Australia and Canada. With the burden of foreign debt getting heavier, it is the least-developed third world nations that are bound to suffer most. The important role of technology in the new divisions of international labour and emerging trade patterns is well-evident. Policy-makers as well as scientists in the third world can no longer afford to be naive about the political significance of biotechnology in the next decade. This gives more urgency to why close and careful attention should be given to World Bank initiatives to sow the seeds for a new biorevolution in the Third World.

Kamani Tubes: Moving Ahead

B Srinivas

Production of tubes in the month of June was well in excess of the target set by the BIFR scheme. 90 tonnes of tubes were produced as against the targeted level of 80 tonnes.

A series of developments have taken place in the past six months at Kamani Tubes, the first ever sick unit to be taken over by workers. All the formalities of takeover having been completed, commercial production has started, with all work processes in operation, recruitment of various cadres completed and different channels of monitoring set up.

For workers at Kamani Tubes, there is both turmoil and challenge. Turmoil, to overcome the financial constraints and meet social obligations; challenge to contribute their best at work to better the performance of the company and to reap the fruits of their labour. It needs to be pointed out that a previous report on 'Kamani Tubes: On the Move' (March 25, 1989) mentioned that the nationalised banks have volunteered to extend loan facilities to the workers to the tune of Rs 10,000 each, to enable them buy the sixty lakh shares of the company. But the nationalised banks fixed an interest rate of fifteen per cent per annum. The workers' co-operative felt that the workers would not be able to bear the additional interest burden. They approached IDBI for the sanction of either interest free assistance or assistance at a lower rate of interest under its seed capital scheme, for contributing to the equity capital. IDBI has, in principle, accepted to grant an assistance of Rs 60 lakh to the workers' co-operative, to enable the members to acquire sixty lakh equity shares of the company, at the face value of one rupee each. The terms and conditions have been stipulated in a tripartite agreement reached between the workers' co-operative, the company and IDBI.

The agreement stipulates that the workers' co-operative should buy back the equity shares to be subscribed by IDBI in not more than seventy-two monthly instalments, with an initial moratorium of six months from the date the company employs all six hundred employees. The society will have to buy back the shares at a price equal to face value plus simple interest of 11.5 per cent less gross dividend if any, received by IDBI from the company. A matching contribution of 60 lakhs has been accepted and paid by the state government. Under the agreement, IDBI shall have the right to appoint two of its nominees on the board of directors. One of the directors had already been inducted, following which, the strength of the board has risen upto eleven. The Board for Industrial and Financial Reconstruction (BIFR) scheme stipulates a maximum of twelve nominees on the board of directors. The board includes two directors nominated by state government, one director by the banks, two directors representing the workers' co-operative, three professionals in related fields, a special director representing BIFR, a nominee director of IDBI and the managing director of the company.

Apprehension, however, does exist regarding the composition of the board. It has been pointed out that a token representation of two workers' directors on a board of eleven, undermines the workers' initiative to control the company. The union however, firmly maintains that at least four other nominees, i e, all professional nominees, have been inducted into the board at the behest of workers and that these professionals stood by the workers in the preparation of their scheme for revival. Proceedings of the regular meetings of the board indicate consensus and unanimity amongst the members. Whether such a trend continues, with workers' decisions getting endorsed in time to come is an issue that needs to be closely watched.

As per the scheme, a plant level committee, consisting of two representatives of the workmen of the company, managers of rods and tubes plants, works manager and personnel officer is being constituted. This committee, of which the managing director is the chairman, will look after the day-to-day working of the plants, supervision of the workers and shall ensure that the production targets are achieved as per the norms. The functioning of this plant level committee will be overseen by a management committee consisting of four members—a representative each of the workers' union, workers' co-operative, banks and the managing director of the company. With the managing director of the company, being the chairman of both the committees, it is expected that close co-ordination can be achieved easily. Since IDBI is the operating agency, it has also constituted a committee consisting of a representative each from IDBI, Bank of India, KTL, state government and a special director of BIFR to monitor the performance of KTL. Besides these committees, the workers' co-operative society has constituted a co-operative committee to oversee the performance of the co-operative. This committee is composed of four workers, two members from the staff, seven members from the officers' category besides two workers' directors of the board. The union has constituted its own committee to look into the grievances of workers and to counsel them on various issues. It has thirteen workers, four members from the staff and is headed by a president and a working president, both of whom are on the board of directors. Thus a number of committees are in operation, working in co-ordination with one another.

It is heartening to note that production is being carried out at appreciable levels. In fact production for the month of June exceeded the targets set by the BIFR scheme in respect of the tubes productions. While the scheme anticipates an annual production of 1,200 tonnes of rods and 960 tonnes of tubes per annum which amounts to 100 tonnes of rods and 80 tonnes of tubes on an average per month, production of tubes for the month of June touched 90 tonnes and the production of rods has reached the targeted level. Thus with respect to production, the workers are very confident of increasing the output. They have set out to increase the production in the next two months by at least 25 per cent. With the current levels of production the annual turnover of the company for this year is expected to be to the tune of Rs 20 crore with a reasonable profit.

The recruitment of various cadres was completed by June. It needs to be mentioned here that only 600 employees could be taken in out of 733 employees. It was observed that workers had to experience a lot of uncertainty and anxiety as various batches of workers were being inducted in a phased manner. The principle followed for recruitment was 'last come, first go'. This principle was applied department/category-wise and not in totality. By this principle, some of the workers, though they had more experience in a given department as compared to workers who had less experience in other departments, could not be employed. This has created a lot of discontentment and resentment amongst some of the workers. Amongst the young generation of workers who are left out, there is a lot of frustration and cynicism. They advocate that workers who have another two or three years of service be convinced to opt for a voluntary separation scheme and that they be inducted as they have served just two to three years for Kamani Tubes.

The union has found this a very delicate problem to contend with. A lot of persuasion is being attempted, by the leadership, to convince the young workers. Added to it, the union is mooting various proposals to identify alternate sources of employment for these workers. It is proposed that a co-operative of these workers be formed, to undertake the packing of KTL products. Another proposal being considered is to start a transport service, employing these workers, which will bring raw materials to the plant. A number of other proposals are being

worked out though they have not yet taken concrete shape. For the workers who are left out, provision has been made, under the scheme, for an amount of Rs 60 lakh for payment of retrenchment compensation and dues of ex-employees to be paid over three years, with the first instalment being payable in April, 1990.

As production scales are increasing, workers are busy discussing issues of profit sharing. In this regard, the scheme calls for fixing of production norms and linking of salary/wages of all supervisors and workers with such production norms as envisaged by IDBI report. The scheme stipulates profit sharing to the extent of 20 per cent of net profits among the employees of company. Fifty per cent of the funds so available will be used and adjusted for allotment of fresh equity shares to the workers' co-operative and the remaining fifty per cent of the funds available for sharing, will be utilised in liquidating the loans taken by the workers/employees, from the IDBI for the purpose of making their contribution. These provisions work in favour of the workers, since the workers need to buy the new shares at the face value of one rupee each, while on retirement or on leaving the company, they will get the returns as per the current appreciated value of the shares. Thus, it is a novel scheme, with lots of benefits to accrue in future, as the company makes increasing profits.

Profitability will of course depend upon the marketability of the product. Though KTL is performing well in the market it is facing lot of hurdles in establishing the supremacy that it established in early 1970s. One of the reasons for this is that sales tax imposed on non-ferrous products in Maharashtra is four per cent, whereas in Rajasthan, where the notable competitors are placed, the sales tax is just one per cent. Because of the high sales tax stipulation, a co-operative sugar factory having placed an order for sugar tubes worth Rs 8.5 lakh, later withdrew it in favour of the Rajasthan seller as it would cost Rs 36,000 less. Further, the company has to pay a turnover tax of two per cent as stipulated by the Maharashtra government whereas in Rajasthan such constraints as turnover tax are not imposed. These issues were raised by the company with the labour and industry minister, Ramarao Adik when commercial production was inaugurated on April 6. The minister promised to look into the grievance of the company and the decision of the government is awaited.

The Kamani employees' union further alleged that competitors are indulging in unethical commercial practices. As union officials pointed out, the quality inspector who was to investigate the quality of outgoing material to a client was forced by a competitor to abstain from visiting the factory premises. This resulted in despatch of material to the client with an assurance on quality which had later to be tested by the client's own inspectors. Another important point to be mentioned is that with the entry of Kamani Tubes into the market, the competitors have reduced the price of sugar tubes by Rs 20 per kg. All these facts go to prove the point that in commercial terms, KTL is still viable and profitable. But the depressing feature of the non-ferrous market is that it is notorious for rampant corruption and underhand dealings. An unenviable task is thus ahead for the marketing professionals of KTL to pierce through such a market by providing quality material and abstaining from the deviant practices of the market. KTL is expected to get into air-conditioning and refrigeration market very soon where profit margins are quite high. It will be interesting to observe how KTL plants out its marketing strategy for the future.

On the industrial relation front, a lot of rethinking is being done in the company. The types of systems and procedures that should be brought in and the sort of disciplinary procedures to be adopted are the issues that are being given serious thought. Being collective owners of the company, the workers feel the need to re-relate and reorient these relations in terms of organisational goals.

Alcoholism pose a serious problem for the company. Though the union has undertaken the exercise of counselling workers to keep away from alcohol while reporting for work, the problem still remains. Neither can such strict disciplinary measures as charge-sheet and dismissal be issued to workers nor can indiscipline be tolerated. A strong plea is being made by the union to its workers to adopt a community approach and social counselling to curb this evil.

Other issues where the workers have assumed responsibility include housekeeping activity and safety provisions, and in this regard workers' efforts are praiseworthy in housekeeping activities and maintenance of safety. Another observation that could be made on the shop floor is that workers have learnt to continue their routine without the supervisor being present. Workers are asserting themselves and are sparing no efforts in forging group activity.

To promote a sense of belonging amongst workers, staff and officers, regular meetings with respective categories of employees have already started. A significant observation that could be made in this context is that there is still a gap that exists between the workers and officers being products of different environments. The workers share a different class situation compared to the white collar employees. That is perhaps the reason, why the sense of identity that the workers have established with the company, is not yet visible, in tangible terms, in the white collar employees. A unified consciousness needs to be forged amongst all categories of employees.

The union situation too merits some attention. The Kamani Employees Union is currently passing through a situation that it has never experienced before. The union situation in KMA Limited is showing signs of lagging and there is a need to revitalise the rank and file and leadership in KMA. This is so because the union situation in one of the units in the compound has a definite bearing on the union situation in the other two units in the same compound. The leadership did realise the urgency of the situation and efforts are on to train the union activists on a continuous basis from July.

Another dimension of the trade union situation is that the president and working president of the union are the directors on the board of Kamani Tubes Limited. The union president (Y V Chavan) representing the workers' co-operative and the working president (D Thankappan) representing the union on the board of directors have repeatedly stressed that they would continue to be on the board only for two years. They insist that workers from the rank and file should be trained and their representatives be inducted into the board of directors. They also feel that they should relinquish the positions they currently hold in the union and act only as advisors in future. They argue that the younger generation of workers should takeover and lead the union so that continuity of active leadership is ensured to strengthen the movement in the Kamani group of companies. Though their stand is commendable, the question persists whether the training imparted to the union activists succeed in making leaders who can compensate for the two experienced leaders who led the union for over twenty-five years. It has to be seen how the rank and file makes effective use of this training and take up the workers' cause.

The success of the venture will be attained when a new participatory culture emerges, with all the six hundred employees making effective contributions in the decision making process. This requires the emergence of a new work ethic with a higher degree of workers' consciousness. This is a gradual process and cannot be achieved overnight. It may take years before such work environment emerges.

Emergence of BJP

A Correspondent

An air of optimism pervades the BJP, the main opposition party in Madhya Pradesh, as rival parties prepare for the forthcoming general elections. Its promise of waiving loans to small and marginal farmers seems to be paying dividends.

IT is a strategy that has unnerved the ruling party and the pity is that they cannot do a thing about it. The BJP's loan-waiver campaign has proved a spectacular success in Madhya Pradesh. During the last eight months, when the programme was launched in the state, an estimated 35 lakh farmers have trooped into the 7,000 'loan redemption camps' organised by the party all over Madhya Pradesh.

The BJP has promised to waive the government and co-operative loans of all small and marginal farmers if it comes to power. It is organising camps in the countryside. The farmers reporting to these camps are made to fill up 'loan redemption forms'—a small fee of rupee one per form is levied by the party to make the process look more authentic—and sit on dharnas at local government offices which finally culminate in massive rallies. Chief minister Motilal Vora calls it a "gimmick".

But the gimmick has caught the imagination of the rural folks and it is causing sleepless nights to the Congress(I) leaders. At least one top ruling party leader, Kamalnath, the high-profile MP from Chhindwara, has advocated waiving of loans. But the Congress(I)'s dilemma is that such a step might be construed as the victory of the opposition rather than the benevolence of the ruling party.

The mood is indeed buoyant in the BJP, the main opposition party in the state, as the various contenders gird up their loins for the next general elections. The party is making a determined effort to challenge the Congress(I) and emerge victorious. It hopes to wipe out the humiliation of the last election when the Congress(I) bagged all the 40 Lok Sabha seats and 243 of the 320 assembly seats. The BJP secured only 58.

Learning its lessons from the ignominy, the BJP had devoted itself to building a strong organisation network—a task it was quietly doing for the last four years—and slowly it has emerged as a giant. And its preparations for elections also started almost two years ago. Patwa claims, "if elections are announced tomorrow, you would not find us unprepared. We are ready with candidates, election machinery and resources."

The BJP has reasons to be confident. Although in the last election it could not gain entry to parliament and secured only 58 seats in the assembly, it polled about 32 per cent votes. In fact, this has been its lowest voting percentage since 1967—showing that it has the support of at least one-third of the electorate in Madhya Pradesh. Where it failed last time was its neglect of the rural areas and its reactionary image among the Harijans, tribals and minorities who together constitute more than 40 per cent of the total population.

In a strongly-worded self-criticism of the party's performance after the last election, former state BJP chief Shiv Prasad Chanpuria accepted that "the organisation failed to build a strong mass-base in the rural areas due to perfunctory implementation of its programmes. The workers did not take enough interest in the rural development programme for welfare of the common man." When Patwa succeeded Chanpuria in 1986, the BJP took up two programmes under his leadership: one was a massive fund collection drive to keep the party equipped for the next elections and the other was to strengthen the organisational network and gear up the party machinery to contest the elections.

The statistics are impressive. BJP membership has grown from three lakh to five lakh, covering 15,000 panchayats as against 7,000 earlier. The number of bloc-level committees has increased from 500 to 675. More importantly, as Patwa points out, the party apparatus now covers all the 40,000 polling booths in the state. And the nuclei of this impressive structure are the 10,000 'power centres' all over the state.

The structure has stood the party in good stead. During the loan-waiving campaign it has succeeded in organising 15 massive rallies at regional and district levels. The reasons of this success are not far to seek. In Bhind district, for example, about 1.65 lakh farmers signed the 'loan redemption forms' issued by the party.

This apparatus also came handy in the massive fund collection drive. It has collected about Rs 1.25 crore as special fund in the districts. The fund has been retained with the district committees and e[arr]marked for elections. Party treasu[rer] Kailash Sarang says, "till now we h[ave] never succeeded in collecting more th[an] Rs 25 to 30 lakh". The BJP has al[so] formed a 16-member state campai[gn] committee.

Drawbacks

But party sources concede that th[e] work among the tribals, Harijans a[nd] minorities leaves much to be desired. T[he] reasons, asserts Patwa, are historic[al]. These sections of the society were trad[i]tionally aligned with the Congress(I). Apart from forming various front organ[i]sations for these sections, the party do[es] not seem to have made any special effor[t] to win the confidence of the minoriti[es] and the scheduled castes. In fact, recentl[y] the party shed some of the secular imag[e] it had painstakingly tried to acquire ove[r] the last decade. Its stand on Ram Janm[a] Bhoomi issue and the bitter attack o[n] Christian missionaries gives the directio[n] of the new moorings.

The BJP leaders are probably bankin[g] on the support their future poll allies, th[e] Janata Dal, will provide in securing th[e] votes of the minorities and the harijans. The former socialists and Congressmen i[n] the Janata Dal are certainly placed advan[t]ageously there. Although on the face o[f] it, the BJP makes tall claims of going i[t] alone in case the Janata Dal persists in it[s] 'unreasonable' demand of contesting 2[?] of the 40 Lok Sabha seats, the reality i[s] that they know that without an allianc[e] with other opposition parties, they canno[t] hope to come to power in Madhya Pradesh.

In a confidential analysis of the electoral situation, the BJP has divided the parliamentary constituencies in four categories, A, B, C and D. It has placed 10 constituencies in A category where it is reasonably confident of winning. There are nine seats in the B category, where it will have to work hard to turn the tide in its favour. The 13 seats in the C category are considered 'uncertain' and the party concedes that its position is very weak in 8 constituencies of the D category. Everyone in the party concedes that the situation would change radically once the opposition forms an alliance and provides a viable alternative to the ruling party. The party leaders are confident that the current difficulties in seat adjustments are 'part of the process' and everyone will come together once the elections are announced.

The Congress(I) is not amused. The Congress(I) in the state was never so badly divided. And the BJP was never so confident.

THE TATA ENGINEERING & LOCOMOTIVE COMPANY LIMITED

Statement of the Chairman, Mr. Ratan N. Tata, for the year 1988–89

Telco has always been widely recognised as the country's premier automobile manufacturer. But this is just the most obvious part of its capabilities. It was only when I got deeply involved with Telco as its Executive Deputy Chairman in April 1988, that I truly understood its enormous technical strengths. The credit for building this unique engineering capability, without any doubt, goes to one person: Mr. Sumant Moolgaokar. It has been his vision and direction over the years that has made Telco the Company it is today. It is, therefore, only fitting that, as I address the Shareholders of Telco for the first time as Chairman, I place on record the outstanding contribution made by Mr. Moolgaokar to this Company.

Mr. Moolgaokar's long association with Telco goes back to 1949, when Telco's operations were confined to steam locomotives. Under his direction, the Company moved into commercial vehicles, earthmoving equipment and sophisticated machine tools. Mr.Moolgaokar's greatest contribution, however, was the creation of a high level of technical ability within the Company, which gives Telco the engineering development capability to independently engineer vehicles as well as other sophisticated engineering goods. His uncompromising insistence on maintaining the highest standards of quality and excellence in all the Company's activities, today, permits Telco to make world-class automobiles.

Although Mr. Moolgaokar stepped down as Chairman in December 1988, the Company will continue to benefit from his guidance, since he remains on the Board as a Director and has recently consented to being appointed Chairman Emeritus. The greatest tribute we in Telco can pay Mr. Moolgaokar will be to uphold the standards of excellence, which he established, and to ensure that there is a continued commitment to technical development and to the motivation of Telco's employees.

RECORD PERFORMANCE

1988-89 has been a good year for Telco The business climate and economic growth in the country substantially improved. The demand for commercial vehicles increased significantly and Telco's operational and financial performance attained record levels. The Company's light commercial vehicle range has been extremely successful in the market, earning a market share of 24%. It is expected that with the enhanced production facilities being established, the market share will increase further.

The Tatamobile pick-up, which has been entirely designed and engineered by Telco, was launched in July 1988 and has been widely accepted in the market as an all-purpose utility vehicle. In 1990, the Company will introduce the Tata Estate, which is a station wagon derivative of the Tatamobile. An advanced prototype of this vehicle will be on display at the forthcoming Annual General Meeting.

LABOUR SITUATION IN PUNE

Against all the achievements of the Company in 1988-89, there has been an unfortunate disruption of industrial peace in the Pune factory. Attempts were made by certain leaders to usurp the right of the management to manage the plant. Acts of violence, intimidation and coercion were witnessed with increasing frequency in March. Obviously, there were no winners – only losers. The Company suffered a loss of production, the workers suffered losses in their wages, and the long-term damage to industrial relations will yet need to be assessed. I have nothing but admiration for those of our employees who continued to do their jobs with vigour, despite the intimidation and personal threat to them and to their families. Without their commitment, the Company would not have achieved the results it did during the last quarter of the year.

No effort is being spared to rebuild the industrial harmony that the Pune plant has enjoyed over the years. The management is keen, as always, to be fair to all its employees and to safeguard their well-being. However, if the situation in Pune deteriorates, intimidation and threats continue and the administrative machinery does not adequately provide for the safety of our employees, the management will be compelled to divert major investment schemes to other locations. Such a step would undoubtedly be disruptive for us, as Pune has been a prime centre of Telco's technical strength. It would also have a major impact on the growth of local ancillaries in the Pune area. As a last recourse, however, such an action may become necessary if the physical safety of the Company's personnel and property in Pune cannot be guaranteed.

PRODUCT DEVELOPMENT AND IMPROVEMENT

In 1967, Telco established a central Engineering Research facility at Pune. Over the last 21 years, the Company has invested over Rs. 115 crores in this activity and created a team of designers and technicians who have been responsible for the development and improvement of all the commercial vehicles being manufactured by the Company. This capability is crucial to the Company's independence and will continue to receive the highest priority in the coming years. Apart from new product development considerable emphasis is being given to the improvement and enhancement of the present range of vehicles, with a view to improving fuel efficiency, reducing emissions, as well as attaining higher levels of safety and greater driver comfort.

Telco's product development and improvement programme will help support its thrust in exports. During 1988-89, the Company registered an outstanding export performance of Rs.81.4 crores. Plans have been initiated for achieving higher exports in keeping with the national objective of increasing foreign exchange earnings.

EXPANSION AND MODERNISATION

Telco remains committed to making investments for the modernisation and further development of its Jamshedpur plant. In the last 5 years, over Rs.150 crores capital investment has been made in Jamshedpur. A new forge shop, a high output foundry line, a new paint shop as well as augmentation of engine and gearbox manufacturing facilities are some of the projects recently undertaken at Jamshedpur. With steadily improving productivity levels, the Company may find it profitable to increase its investments in Jamshedpur.

Plans are being implemented for constructing a modern manufacturing facility at Lucknow. The factory will produce medium and heavy commercial vehicles as well as special purpose vehicles. This plant is expected to play a significant role in the future development and growth of Telco.

The Company is actively discussing a proposal with Daimler-Benz to manufacture their 'World Concept' range of commercial vehicles. The vehicles would be marketed overseas by Daimler-Benz under their brand and would lead to a technological upgradation of the existing range of vehicles in India. The project would yield substantial exports for the country and would further strengthen Telco's technological base and capability to make vehicles to international standards.

POLICY SUPPORT

The liberalisation initiated by the Government of India in recent years has successfully increased the supply and almost brought to an end the era of shortages in the country for a wide range of industrial and consumer goods. However, substantial anomalies exist, where import duties are higher on raw materials needed by actual manufacturers, but semi-finished or fully-finished components or product assemblies attract concessional rates of duty. In select cases, where higher levels of import content are justified initially, it would be in the national interest to ensure that indigenisation commitments are maintained so as to conserve scarce foreign exchange.

There is a pressing need to encourage the establishment of high quality ancillary units in the country with the technical capability for indigenising the manufacture of key components and sub-assemblies for the engineering industry. Government policy support for these units would go a long way to build a strong base for India's engineering industry.

A NEW MISSION

Telco has established an undisputed lead in the commercial vehicle industry in India. It has attained a predominant market share in the medium and heavy commercial vehicle market and its share in the light commercial vehicle market is growing rapidly. The near future will also see Telco as an important player in the field of lighter passenger-oriented vehicles.

A company needs to continuously grow in order to motivate its people. Expanding markets, a wider product range and diversification can all provide such growth. With the skills and capabilities that have been built into the Company, Telco is ideally suited to enter the industries of tomorrow. Your management is undertaking to identify strategic options utilising Telco's areas of strength.

THE TELCO TEAM

During the year of my active association in Telco, I have recognised that the ability of Telco to perform has been largely due to the team spirit and pride that exist throughout the Company. I feel proud to be a member of this team and look forward to a future of continued growth and prosperity for Telco.

Ratan N. Tata

Bombay
27th June 1989

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

IN MEMORY OF SUMANT MOOLGAOKAR

When I wrote about Sumant Moolgaokar in the opening paragraphs of my Statement to the Shareholders of Telco, I did not realise that in a few short days he would no longer be in our midst. We were all aware that he was unwell but we had hoped that he would recover as he had, on more than one occasion, in the past. But this was not to be: In the early hours of the first day of July this year, Telco lost its greatest asset and India lost an industrialist of irreplaceable worth.

Sumant Moolgaokar was a technocrat with extraordinary foresight and a builder of people. He had a vision of building a strong engineering base for an independent India and saw the automobile industry as the prime means of achieving it. Taking the helm of Telco around the time the nation attained independence, he made it a model of what could be achieved in a developing country through will, dedication and a firm resolve never to accept second best. The rugged Tata vehicles that far outnumber any other make of commercial vehicle on Indian roads are the incontrovertible proof of Mr. Moolgaokar's outstanding technical vision. He had a talent for inspiring design and production engineers to give the customer the right combination of innovation and value-for-money. In his mind, the strategy was clear and he took the Indian operator, in stages, from the World War II generation designs Telco started with, to the internationally-competitive vehicles the Company turns out today. But if there is to be one single aspect for which Mr. Moolgaokar will be remembered most, it is his belief in what people can do. Long before management development became a popular buzz-word in executive circles, he consciously selected promising young men, gave them challenging assignments, encouraged their efforts and took personal interest in their growth and development. People with fresh new ideas, new approaches and different outlooks always found a strong supporter in Mr. Moolgaokar. He gained a reputation for building top-grade managers and creating an environment that led to their motivation. Many senior managers look back at their early days under Mr. Moolgaokar as the period that made the greatest contribution to their careers.

We in Telco will miss Sumant Moolgaokar enormously. The Company has yet to absorb the fact that the man who built it is no more. There is shock and there is grief amongst us, but we must face the realities with the courage and the resolve we have inherited from this great man. All of us in Telco stand committed to take this Company, which is the life-work of Sumant Moolgaokar, to heights he envisaged and to uphold the high traditions he so firmly established over the years. That will be our greatest tribute to the memory of this wonderful man.

Ratan N. Tata

Bombay
6th July 1989

Eighth END Convention

Amitabh Mattoo

The economic union of Europe must include the east bloc if peace and prosperity are to be secured. Likewise closer co-operation with developing countries is necessary.

THE eighth European Nuclear Disarmament (END) Convention was held at Vitoria-Gasteiz, in the Basque region of northern Spain, from July 6 to 9, 1989.

END was launched in April 1980, following an 'Appeal' drafted by—among many others—E P Thompson (the well known historian), Mary Kaldor (researcher at the Armament and Disarmament Information Unit at Sussex) and Zhores Medvedev (a dissident Soviet historian). The immediate aim was to initiate and co-ordinate action, by anti-nuclear groups from all over Europe, against the NATO decision to deploy intermediate range nuclear missiles in western Europe. END also hoped to mobilise public opinion in favour of a nuclear-free Europe; campaign against the two military blocs (NATO and the Warsaw Pact) which were dividing Europe; to bring the peace movements and the movements for civil, human and trade union rights closer to each other; and to express solidarity with third world concerns and struggles.

The first END Convention was held in 1982 in Brussels and since then the convention has been held, each year, in different parts of the continent: in Berlin, Perugia, Amsterdam, Paris, Coventry and Lund. The INF treaty—between the United States and the Soviet Union in December 1987—agreeing on the elimination of intermediate range nuclear missiles, changed the situation. The peace movements suddenly lost their central focus of attention. The Lund Convention in 1988, while celebrating the treaty, emphasised the need for END to evolve, to keep up with the times, for its own survival. In a strange way Gorbachev and the INF treaty, while ensuring that the nuclear issue was no longer the centre-piece of the political agenda, also marginalised public support for the anti-nuclear movements. The 1989 convention was a recognition of the fact that END needed to re-order its priorities in changed times—the importance of looking beyond Europe, and thinking globally. The convention paid silent homage to all those who were killed, in the struggle for democracy and freedom, at Tiananmen Square.

The central theme of the convention was "The global dimensions of peace: disarmament for development". The emphasis was on the north-south divide, third world conflicts, the future of Europe (and of its relations with the rest of the world) after the economic union of 1992; and, to a lesser extent, on the quest for global nuclear disarmament and the politics of NATO's plans to modernise its short-range nuclear missiles.

Delegates in the first plenary session, pointed out that east-west detente had brought into the forefront the stark contradictions existing between the north and the south. The debate focused on the debt crises, and the need to drastically reschedule and, in some cases, write off the loans. Schemes like the Brady plan, it was emphasised, would not have much impact unless they broadened their limited parameters and accommodated countries other than just the political allies of the United States.

Attention was also drawn to the growing poverty of the global environment, which could not be separated from the asymmetrical nature of international politics itself. The dumping of toxic waste by the western world in poor third world countries, rather than go through the expensive process of recycling, was a cause for grave concern. Speakers emphasised the increasingly interdependent nature of the world. Attention was also drawn to the depletion of the ozone layer and the consequent global warming which was bringing it to the edge of disaster. The need for an urgent summit of leaders from the north and the south, for joint action and common survival was articulated.

The conflicts in the Mediterranean area were the subject of a separate plenary session. Several Palestinian and Israeli groups were represented during the debates on the Middle East problem. All were unequivocal in their condemnation of the atrocities inflicted by the Israeli army and the government, during the *intifada*, on the people living in the occupied territories. Most also agreed that any permanent solution to the problem would have to include the PLO, and the United States' acceptance of this was welcomed. The urgent need for an international conference on the issue was perceived. Mention must also be made of a group from Israel: 'Women in Black', who were well represented at the convention. This is composed entirely of Jewish women who march through the streets of Jerusalem—wearing black dresses—in solidarity with the Palestinian resistance. The other conflicts discussed included those between Morocco and the Polisario Front, and those within Cyprus.

Delegates voiced concern at the prospect of economic integration of western Europe in 1992. Was that a first step towards a European fortress, integrated militarily as well? Most agreed that any European union should include countries from eastern Europe in the common pursuit of peace and prosperity. The integration should not create increased protectionist measures to the exclusion of the less developed countries, but work in close co-operation with them.

Germany's resistance to the proposed NATO modernisation of its short-range missiles was welcomed, though it was felt that the present German government was holding out for purely electoral reasons. The peace movements, most delegates believed, must vigorously campaign for a third zero, towards the elimination of all short-range missiles.

The conference ended with a trip to the Basque town of Gernika, which was destroyed in 1937, during the Spanish civil war, by Franco's army with the aid of the Italians and Germans because of the Basque government's support for the Republicans. Today it stands as a symbol of the Basque peoples struggle for identity and autonomy, which they got in 1979 soon after Franco's death. Basque country is now an autonomous region within Spain.

Problems of Poland's Foreign Debt

Jan Lisowski

While Poland's rouble debt is not a unique phenomenon in CMEA, it is the country's high debt with developed countries which complicates the situation.

POLAND's foreign debt is one of the most serious economic problems facing the country. Besides the indebtedness in the developed countries, the debts in CMEA are an important element of the problem. Since 1974 the debt of Poland in transferable rouble (rbt) terms has been growing due to the trade deficits. The growth was especially rapid in the 1980s, mainly to the Soviet Union. In 1975 the rouble debt amounted to rbt 430 mln, in 1979 rbt 845 mln, by the end of 1987 it was eight times higher than at the end of 1979 (Table 1). In 1988 the rouble debt of Poland decreased by 0.1 bln, to the level of rbt 6.5 bln. The debt consisted mainly of the liabilities to the Soviet Union (Table 2).

The average interest rate on Polish rouble liabilities increased from above 2 per cent in the beginning of the 1980s to 4 per cent in the mid-80s and 4.4 per cent in 1988. The interest payments are made currently and their 1988 value amounted to rbt 286 mln.[1]

The fast growth of the debt in the 80s and the inability of Poland to pay the liabilities to the Soviet Union and the CMEA International Bank of Economic Co-operation (MBES) have resulted in postponing payments of rbt 3.9 bln from the period 1986-90 to the years 1991-95.

The results of research works done in the previous years in the Institute of Economics of Polish Academy of Sciences[2] show that the deficit in Polish trade with CMEA resulted mainly from the unfavourable changes in terms of trade caused by the changes in prices of oil, natural gas and other raw materials imported from the Soviet Union. Thus, the possibility of repaying debts will depend on the future prices in the intra-CMEA trade.

The 43rd CMEA Session initiated work on the rules of price formation in intra-CMEA trade in the years 1991-95.[3] Three proposals were submitted: gradual switching to the current world market prices in 1995 (proposal of Poland); continuing the existing five year average principle; shortening the basis period from five to three years.

The other direction of the works, connected closely with the prices, is improvement of the CMEA financial mechanisms. The works concentrate on three topics: Strengthening the role of transferable rouble as a common currency of CMEA; Conditions of introduction of a partial convertibility of the transferable rouble; Opening in MBES of special accounts in transferable roubles with a possibility o[f] their exchange for the convertible curren[-] cies; using national currencies in exchang[e] of goods and services in direct co[-] operation of enterprises (five bilatera[l] agreements have been signed so far, bu[t] their role is still not significant).

The decisions taken in the two areas wi[ll] have an impact on the conditions of th[e] rouble debts repayments. It is hard t[o] describe the conditions now, since the dif[-] ferences in interests of individual membe[r] countries cause slow progress.

Except the trade in transferable roubles part of Polish trade with CMEA countrie[s] is conducted in convertible currencie[s] (Table 3).

TABLE 2: STRUCTURE OF POLISH ROUBLE DEBT, 1988

* The data include total turnover of individual CMEA countries with the other member countries.

Source: Calculated according to the data from *Statisticheski Ezhegodnik Stran-Chlenov SEV*, Moscow, 1976-1988.

The balance of the turnover in convertible currencies (a total US $ 144.5 mln for 1981-87) shows, that it has not played a significant role as an element of Polish debts in CMEA countries, also as an instrument of solving the problems. However, the balance of the trade in convertible currencies does not fully reflect the size of Polish liabilities or dues in convertible currencies in the CMEA countries. It does not include financial credits in convertible currencies. The conditions of the credits are freely negotiated and it can be expected that the interest rate is at least equal to the one on the international credit market.

Poland's debt in the other CMEA countries is not unique in CMEA. Such debts can be seen in Czechoslovakia and Bulgaria; in GDR and Romania the surpluses are most probably offset by the surpluses in the trade with non-European CMEA countries (Vietnam, Cuba). The problem of the debts of individual CMEA countries in the other member countries concerns mainly their liabilities to the Soviet Union (Table 4).

Hungary is the one country having considerable surplus in trade with the Soviet Union. The inability to use the surplus in the trade with the Soviet Union in the trade with the other countries and the strong inflationary tendencies in Hungary make the surplus rather troublesome to the Hungarian authorities. Therefore, Hungary has undertaken measures to rationalise the trade in roubles and to curb its rouble exports. One such measure is a planned rouble auction in the Hungarian national bank. During the auction the exporting enterprises will offer their roubles to the importing ones. In case the exporter does not achieve during the auction an exchange rate at least equal to the one achieved in his export, it will be an incentive to decrease his rouble exports.

Poland's rouble debt is not a unique phenomenon in CMEA. The basic difference in Polish situation is the high debt with developed countries as well as in the CMEA countries simultaneously. This may complicate the solution of the problem of Poland's foreign debts.

Consistency and Ambiguity in South Asian Islam

Ishtiaq Ahmed

Shariat and Ambiguity in South Asian Islam edited by Katherine P Ewing; Oxford University Press, Delhi, 1988; pp 314 + index, Rs 250.

THIS book consists of papers presented at a conference on 'South Asian Islam: Moral Principles in Tension', which was held in 1981 in Pennsylvania. The various contributors represent a variety of disciplines: anthropology, history, religious studies. The anthropologists are by far the largest group. In the 'Introduction' the editor declares the purpose of the study as an examination of the relationship between the codes for behaviour derived from Islamic principles and codes originating from other sources. The general Muslim belief is that the Shariat, i e, Islamic law, is the supreme and all-comprehensive code of behaviour to which alone they are required to render adherence. In reality the Muslim community in its fourteen centuries of history has been influenced by diverse outlooks and traditions besides the Islamic. That such were to happen is not surprising considering the fact that Islam spread to various parts of Asia and Africa, and in the process local traditions and culture lent their own imprint to the Islamic identity which evolved in the process. Furthermore, from the very outset Muslims were not a cohesive community but comprised several sects and subsects and ethnic and linguistic variations. South Asian Muslim identity presents a good example of multi-dimensionality, cultural diversity and ethno-linguistic and sectarian heterogeneity. The result is plurality and ambiguity rather than consistency and conformity which Muslim theorists assumed in their ideal version/versions of the Islamic community.

The editor points out that a basis for accommodating inconsistency between the ideal and the real, however, has existed implicitly in the very way Muslims interpreted history. The generally held belief was that the most perfect period in human history ended with the demise of the Prophet (632 A D) and the end of the pious caliphate. In other words, only during that brief period in history lasting about 40 years did the Shariat find its fullest expression. The main implication of such a view of history was that subsequent Muslim society was considered a divergence from the ideal model. An effort to conform as much as possible to the ideal society was considered the bounden duty of all good Muslims. Also, in the Muslim tradition the duty of the state and the ruler in ordering society along Islamic lines was assumed, but it was not clear to what extent the state is obligated to enforce Islam.

Now the ambiguities of everyday life tend to obscure the inconsistencies that creep into a community's organising principles. However, in periods of crisis or rapid change awareness about the discrepancies between a community's professed standards and its deviations become accentuated. At such times a re-evaluation of the situation becomes inevitable and this means that efforts are made to re-define the boundaries of the community. The question of boundary also involves the re-alignment of the social strata within the community in terms of its core and periphery.

Proceeding from such premises various scholars have contributed articles which address various facets of south Asian Islam in the modern period. It is noted that quite early in history a socio-intellectual hierarchy was established in south Asian Islam. The ruling class consisting of Turks, Afghans, Persian and people claiming Arabic origin were considered the proper bearers of Islamic conduct and values. The peasant converts of Indian origin related themselves to Islam through *pirs* (religious mystagogues). In other words, the average Muslim was not expected to represent model Islamic conduct. However, when the British captured power in the subcontinent the old order of society based on a strict separation of the *ashraf* (elite) and the *am log* (ordinary Muslims) could not continue. In fact already in the 18th century when Muslim power began to decline, revivalist and reformist movements emerged in different parts of south Asia. These were founded by radical *ulama* (Muslim priests) who strove to mobilise the peasant masses for militant resistance against non-Muslim political powers and oppressive landlords. In this process some segment of the Muslim masses received a more orthodox schooling in Islam. However, the vicissitudes attended upon the fortunes of south Asian Muslims in the present times have added further intricacies in matters of belief and practice.

The book is divided into three parts. Part one examines debates over institutionalisation of Islamic principles; part two looks at the changing idiom of political discourse; and part three concentrates on the attempts of the Muslim community to define boundaries *vis-a-vis* others and in relation to competing Muslim groups.

The first article in part one shows how experts representing two different orthodox Sunni schools of jurisprudence come to diametrically opposite conclusions regarding the cleanliness of dog saliva. Both use similar jargon and techniques but come to conflicting decisions, one declaring dog saliva unclean and the other clean. The second article examines the interesting discussion in pre-partition Punjab on the conflict between customary law based on tribal traditions and the Shariat. The third article deals with the process through which the followers of the Agha Khan, the Nizari Ismailis, abandoned the policy of concealing their true identity in Sunni society and declared their Shia credentials. This transformation took place when their Imam, the Agha Khan left Persia and settled in India in the 19th century. As a consequence many Hindu and orthodox Muslim influences were shed and the community integrated around a more distinct profile of its own.

Part two includes several articles. One deals with the Muslim architecture of Sher Shah Suri (ruler of northern India between 1538-45). Another article concentrates on the important role that the Urdu language has played in modern south Asian culture. The third article is perhaps the most interesting in this section. The author, Rafiuddin Ahmed, traces the evolution of Islamisation of Bengali Muslim society. Not until the 18th century did Bengali Muslim masses develop a distinct Islamic identity. Previously conformity to Islamic standards was expected only of the upper class Bengalis, most of whom claimed foreign ancestry. Muslim revivalists mobilised the Bengali peasants for militant struggles. Consequently these Bengalis developed strong associations with Arab-Persian culture, and drew away considerably from their Hindu past. The creation of Bangladesh was a return to the Bengali identity, this did not weaken the Islamic link.

There are other articles examining social structure, sects, leadership patterns and the process of change affecting south Asian Islam and the Muslim community. An article on Baluchistan discusses the peculiarities of the Zikri sect, a minor mystical order of Shia leanings, which has followers among Balauch tribes (most of whom are Sunnis) living along the Karachi coast.

In part three the focus is on the several ways in which Muslims have sought to define their group boundaries, not only in relation to other communities but also in relation to other Muslim groups. An article on the culture of ethnicity in Pakistan deals with the prevailing images/self-images and beliefs among different groups in Pakistan and their identification with Pakistan. Another article deals with the concept of honour among Oasis Balauchs. There are some other articles too of an anthropological nature.

The book provides information on a wide range of phenomena dealing with some aspect or facet of Muslim society and how Islamic values along with other cultural impulses affect its behaviour. But this very quality of the book of being a collection of articles—mostly anthropological studies limited to case studies of tribal, sectarian and ethnic groups and fractions—confirming the hypothesis that the Shariat does not

uffice as a legal and moral code to regulate luslim behaviour renders it a loose comilation of data, rather than a systematic allound study of the relationship between proessed ideals and concrete behaviour of a elected group, sect or tribal society. Putting ogether studies of social structure and codes f honour of remote Balauch and Pukhtun ribes and sects, the process of integration f urban Muslim communities of Kanpur nd Benaras; the historical evolution of engali Muslim identity and Ismaili hiaism; and Muslim architecture of Sher hah Suri and the impact of Urdu on nodern south Asian culture and the plethora f other studies in one book only sustains the very broad hypothesis that south Asian Islam represents the tensions of both ambiguity and efforts to return to a more Islamic identity. That such were to happen in the life of Muslim peoples of south Asia should not be surprising to social scientists. What one learns is a little about many things but not enough to draw a more profound conclusion about the general behaviour patterns prevailing among Muslims, or which are likely to emerge in the future. Partly this follows from the fact that the book does not place the discussion in the context of the macro changes affecting society at the level of state and politics and of socio-economic change.

No Surprises

Sita Prabhu

Wage Employment Programmes in Rural Development: A Study of NREP in Gujarat by Indira Hirway, Oxford and IBH Publishing Co, 1986; Rs 60.00.

THE provision of direct employment to the rural poor is increasingly being relied upon as a major instrument of poverty alleviaion in the country. It is in this context that studies examining various aspects of the employment programmes implemented hitherto assume considerable significance. The focus of the book by Indira Hirway is mainly on the problems concerning the planning and mplementation of the National Rural Employment Programme (NREP) at the district and taluka levels in Gujarat.

The book begins with a brief discussion on wage employment programmes in the process of economic development in general and is followed by a sketch of the origin and contents of NREP. The performance of the NREP is examined with respect to six selected districts in the state mainly on the basis of secondary data collected from the administrators of the programme at various levels.

The study reaffirms certain well known shortcomings of the NREP such as its weak planning component, lack of co-ordination among various agencies implementing the programme and the non-durable nature of assets created. The sporadic nature of employment provided as well as the nonadherence to minimum wage norms also corroborate the experience of the programme in other regions. The book thus does not contain any surprise for the reader. However, a few interesting points are raised, which the author, unfortunately does not pause to discuss.

An issue of fundamental importance is the criterion used for allocation of NREP funds among districts and talukas. According to the official guidelines, 75 per cent weightage is to be given to the number of marginal farmers and agricultural labourers and 25 per cent to the incidence of rural poverty. In the absence of data regarding the population below the poverty line, the population of scheduled castes and scheduled tribes is to be considered instead. Hirway, citing block level surveys conducted by the government of Gujarat states: "Studies have shown that the incidence of unemployment is not positively and significantly associated with the population of marginal farmers and agricultural labourers; on the contrary there is enough evidence that suggests that this association is negative and significant. Also, there is evidence to suggest that areas with larger population of agricultural labourers and marginal farmers are relatively better developed. In other words the scheme of allocation of NREP funds is likely to allocate larger resources to those areas which are relatively developed and which have a smaller incidence of unemployment" (p 22).

Having concluded that the allocation criterion is faulty, it is surprising to find the author relying on the same criterion to judge the appropriateness of the allocation of funds to the districts and talukas. See for example the following statements:

> District-wise allocation of NREP funds also seems to have been done almost according to the guidelines. Consequently, the districts with larger population of SC/ST and of marginal farmers and agricultural labourers have got as well as spent greater NREP funds. This is definitely worth noting.
>
> The allocation of funds below the district level, however, has not been very satisfactory. Our study showed that this allocation did not have a positive and significant association with the distribution of the population of the weaker sections (p 57).

Another interesting point that is raised is with respect to the importance given in the guidelines to the identification of 'felt-needs' of the people and the role of panchayati raj institutions in this regard. Hirway argues that the felt-needs of the people may not always reflect what is desirable for the community. Secondly, given the stratified nature of Indian villages, it is very likely that only the needs of the influential groups get articulated. Under these circumstances, the author feels that the emphasis given in the guidelines that works suggested by panchayats and people's representatives should be considered for implementation under NREP is not desirable. Hirway's suggestion that ". . . a beginning should be made with beneficiary participation rather than with representative participation" (p 103) is unexceptional.

Another interesting issue of wider implication is the role of labour co-operatives in executing NREP works. From the comments of the author scattered in various places, it is possible to gather that wherever labour co-operatives were operating, workers were provided with continuous employment. This is in sharp contrast with the intermittent nature of employment provided in other NREP works executed in the same district. However, the wage rate was relatively low in the works taken up by labour co- operatives. More intriguing is the fact that though labour co-operatives were initially allowed to execute NREP works, they were later banned. Hirway states that ". . . the use of labour co-operatives was permitted by the end of the first year on the ground that these are co-operatives of the workers who would work on NREP works. A number of labour co-operatives took up NREP works in the six districts. The weaknesses of such cooperatives, however, surfaced after sometime, and the co-operatives were banned in the second year" (p 80). Readers looking for an explanation of the nature of the 'weaknesses' would find their search futile as no further elaboration is provided.

Finally, it is surprising that the author has not deemed it fit to reveal the identity of the six selected districts and talukas on which the conclusions of the study are based. While one can understand the labelling of districts/talukas alphabetically or numerically for ease of exposition, a reader would certainly expect to know the names of the districts/talukas selected for study in the text or atleast in an appendix. The absence of such identification would certainly deprive other researchers in the field the use of the data presented in the book.

Micro-Ideology and Micro-Utopia in Khalapur

Changes in the Discourse on Caste over Thirty Years

Pauline Kolenda

The caste system has been a major topic for discourse in India throughout the nineteenth and twentieth centuries. In the mid-50s the author spent sixteen months on an ethnographic study of Khalapur, a village in western Uttar Pradesh. The issues then were educational and occupational access for low-caste and untouchable people and other practices of untouchability. The villagers could not conceive of a society that was not caste-organised and equal treatment was a foreign urban Congress Party issue. Has the discourse about caste changed in the last generation? If so, how?

...it is not men in general who think, or even isolated individuals who do the thinking, but men in certain groups who have developed a particular style of thought in an endless series of responses to certain typical situations characterising their common position. [Mannheim 1936:3]

In this village, people are in favour of the caste system. They think it is a good way of ordering society. It was a teaching of their forefathers to think in this way. The feeling is still strong among the villagers, although the government is very much against caste and preaches against it (a Rajput elder of Khalapur, 1955).

THE topic of ideology has been treated and defined in many ways over the past century. Marx and Engels gave the term a definite political content; ideologies were world-views of social classes that explained and justified the superiority of the social class that made up its main adherents, and justified the necessity for other social classes to accept *that* social class's definition of things. An ideology masked the self-interest of its main adherents from the audience, those the adherents were interested in taking advantage of, but whom they also hoped would accept their hopefully-not-too-feeble excuses.

But ideology has been defined in other ways. Louis Dumont (1970, 1978), the French social-cultural anthropologist, defines ideology as the principal values of a society, and his units of study are entire nations or even large portions of continents, so Dumont can write about the hierarchical person of the east, meaning primarily India, and the individualistic person of the west, meaning primarily France. In such a definition of ideology, I am reminded of Ruth Benedict (1934) who characterised a culture as pervaded by a dominant drive that shapes all its institutions—the Zuni and other Pueblo Indians were Apollonian, the Kwakiutl were megalomaniacal paranoids, the Plains Indians were Dionysian—except that while Benedict saw styles, rather like styles in art, Dumont sees core ideas, kernel-assumptions. Dumont rejects a multi-ideological approach [Dumont 1970: 263-64]; a society has a single global ideology, he asserts, and that is what he is interested in. In the singleness of the style or idea, Benedict and Dumont are alike.

Both Marx and Engels (1948) and Althusser (1970) have emphasised the consistency there should be between the human relationships in the production of commodities and the teachings or ideologies promulgated in other institutions, especially, for Althusser, churches and schools. Theirs is a kind of functional analysis that also looks for ulterior motive.

Max Weber, unlike Althusser or Dumont, raised the issue of the relationship between ideology and social and economic change. He was concerned with unplanned change as opposed to Marx and Engels (1948) who might be said to have been concerned with planned social and economic change purposefully brought about by the use of rather drastic measures. In relating the Protestant ethic to the development of capitalism, Weber not only suggested that ideology must be consistent with the economy, the relations of production, but that changes in ideology precede changes in the economy [Gerth and Mills 1946: 321]. Recently, a historian of capitalism, Chandra Mukerji (1983), has challenged Weber's interpretation, agreeing that there were changes in ideology before the flowering of capitalism, but that they were not ascetic in content as in the ascetic Puritanism backed by Weber, but rather luxury-loving in a new consumption-orientation diffusing from "the *nouveaux riches,* the courts, and the aristocracy" [Appadurai 1986:37]. In this interpretation of the ideological changes preceding capitalism, Mukerji and other historians are following the lead of Werner Sombart (1967), rather than Max Weber.

Most interesting to me is the treatment of ideology by Karl Mannheim (1936), because he seems more than other theorists to address the empirical situation as I have found it. There is seldom one ideology among the members of a community. While Mannheim did not emphasise the multiplicity of ideologies, he did see that there might be a contention between ideologies. He called the established ideology, ideology, and the new challenging ideology, one advocating change, utopia, and he saw this contention as one between social classes. In Khalapur I do not find contention so much between higher and lower castes as between old ideology and new, the new being set by the Congress Party leadership in the central government in the 1950s and 1980s and by the Indian urban educated middle-class in the 1980s. These new ideologies challenge rural people, especially the village intellectuals, responsible educated and articulate male leaders.

Michel Foucault (1970, 1980) has suggested that discourse within a society or a sector of a society changes over time. One of the topics for discourse in India has been the caste system. It has been a topic for discussion throughout the nineteenth and twentieth centuries. In this paper, I can only treat the recent past, but I do raise the question: Has the discourse about caste changed in the last generation? And if so, how?

The major ideologue concerned with caste in the first part of the twentieth century was Mohandas K Gandhi. He made the issue of untouchability integral to the cause of independence from the British. The major change he advocated was the end of mistreatment of untouchables by higher castes. Bhimrao Ambedkar, the author of the Indian Constitution, himself born an untouchable Mahar, saw to it that untouchability was outlawed in the Constitution of India [Joshi 1954], established in 1950. This document contains passages such as the following, "untouchability is abolished and its practice in any form is forbidden" (Article 17), "all citizens shall have the right to practise any profession or to carry on any occupation, trade or business" (Article 19 (g)), and "no citizen shall be denied admission into any educational institution maintained by the state or receiving aid out of the state funds on grounds of religion, race, caste, language, or any of them" (Article 29 (2)).

In the mid-1950s, I spent sixteen months doing ethnographic fieldwork in a village of 5,000 people in western Uttar Pradesh, as one of a social sciences group from Cornell University.[1] I was particularly interested in the caste system and in untouchables. In 1958, my paper 'Change in Caste Ideology in a North Indian Village' was published. In

that paper, I summarised the views of four older men of the village, who were respected members of four different castes, two of high caste and two of low. One was of the largest landed patrilineage of the village Rajputs, another was a wealthy shopkeeper and moneylender, the third was the headman of one of the two untouchable Sweeper colonies, and the fourth was an elder of the untouchable Chamars, once leather-workers, now mostly agricultural labourers.

While I had interviewed at length and in considerable depth, all four of the men, as well as others whose opinions were not included in the published article, I also had an interview guide of questions (Appendix I) that I had each of them answer. When I returned to Khalapur in 1984 to do a thirty-year-later study, I interviewed two of the four men again; the other two had died; and I interviewed seven other men of different castes using the same interview guide. The nine men whose caste ideologies I shall explore are from the Rajput, Baniya, Chamar, Sweeper, Water-carrier, and Goldsmith castes. Most of these men I also interviewed more broadly. What I wish to do in this paper is say something about how caste ideology seems to have changed over thirty years in the village of Khalapur. In a longer work, I hope to treat changes in several other aspects of the caste system in Khalapur.

First, however, let me say something about Khalapur. It is located in western Uttar Pradesh, about 100 miles north of Delhi, in a prosperous sugarcane-growing region. In 1954, the population was about 5,000 people; in 1984, it was about 15,000. The dominant caste was and is Pundir Rajput; about 40 per cent of the population belongs to one or another of the minor or minimal patrilineages of the maximal patrilineage of Pundir Rajputs. Virtually all male Rajputs trace their descent from the founding brothers who conquered the Jats who held Khalapur about 300 years ago [Hitchcock 1956: 131]. They own, even after zamindari abolition, 80 per cent of the land and control all land. The rest of the population live in Khalapur at the invitation and sufferance of the Rajputs. No other caste begins to be as large as the Pundir Rajputs, but there are a few hundred in each of the larger castes, the Brahmans, untouchable Chamars, untouchable Sweepers, and the Baniya shopkeepers. The other twenty-five castes have smaller numbers of people; they include Goldsmiths, Barbers, Carpenters and Blacksmiths, Washermen, Oil-pressers, and so on. About ten per cent of the population are Muslim; ninety per cent are Hindu.

In the 1950s, Khalapur was slated for change. Three important change factors had been introduced: first, it was one of the pilot villages for the new Community Development Programme that the government of India began in 1952; second, partly as part of this latter programme and partly because a local man had become the deputy planning minister for the state of Uttar Pradesh, sugarcane as a crop of the region received many catalysts in the form of agricultural programmes, irrigation facilities, price-supports to the farmer, co-operative credit facilities; thirdly, a high school was established in Khalapur in 1949. The changes programmed have indeed taken place. The amount of sugarcane grown in Khalapur has increased manifold, and the money flowing to the large landlords from cane receipts ran by the 1980s into many crores. The enrolment in the high school had increased over the years from less than a hundred boys in 1949 to over 1,200 boys and over 300 girls in 1984.[2]

Many facilities have come to the village. The number of shops has tripled, but given the tripling of population that is about what we should expect. However, a bank was established, a branch of the State Bank of India by the latter part of the 1960s; later came a small hospital. New to the village are three or four teashops. None existed in 1954. Also new is the bus service and the paved roads. A bus comes each way once a day, but horse-drawn platforms, called *boogis* go to the nearby town, five miles away, all morning, and they return all afternoon. We counted over twenty of them in 1984. The number of primary schools has increased from 2 to 7, and the enrolment in primary school has increased from 200 boys to 923 boys, and from 40 girls to 543 girls.[3]

The intellectual level of the village is at its highest among the masters who teach at the high school, and to some extent it is also set by teachers who teach in the primary schools, as well as the government medical doctor at the hospital, not a villager. There is still no one in the village who speaks English with facility, although two or three of the primary schools claim to be 'English-medium'. The high school consisting of grades seven through twelve is not English-medium, but Hindi-medium.

Many men have worked outside the village, for years at a time, especially Rajputs and some Chamars who have been in the military or in the police of the region. Untouchable Sweepers have worked on the municipal garbage crews of various cities. Others have worked in factories or shops in cities, as well. There are two nearby towns, one four or five miles away, the other eight miles away, and many modern amenities are available in the towns, including radio and TV shops, tractor and lorry repair shops, cinemas, barbers who do fashionable cuts, tailors who can stitch a three-piece suit, shops selling synthetic saris and terylene for sports shirts, and so on. There are no repair shops in the village, although in 1984 there were about 80 tractors in the village and 40 television sets. One of the most noticeable changes in Khalapur as between the 1950s and 1980s is the absence nowadays of very many bullocks. Because tractors do the heavy ploughing, bullocks are not needed, and the male water buffalo has become the main draught animal, drawing extremely full carts of cane from the fields to the sugar mill in the nearby town.

In the mid-1950s I interviewed three Rajput elders, a Baniya shopkeeper, two untouchable Chamars and an untouchable Sweeper using the Caste Sanctions Interview Guide, reprinted in Appendix I. Trying to understand the caste system from the point of view of the Khalapur villagers and using these village intellectuals as my sample for village ideology, I found that the Khalapur villagers spoke of the local caste system in terms of six binary pairs: the *rāya* (or *jemindar*)- *rāyā* relationship, the *khasgar-lagdar* relationship, the *jijman* (or *jemindar* or *kirsan*)-*lagdar* (or *kamin*), the *kirsan-hali*, the *uncha-nicha* system and the *bara-chota* system [See Kolenda 1978].

Let me briefly suggest what was meant by each of these. The *rāya* is a chieftain or king and the *rāyā* is subject (pronounce as 'rye' and 'rye-ya'). The elder Baniya (shopkeeper) explained:

> For example if I have one or two bighas of land and I build on it a few houses, then the people living there are rāyās. The rāya takes *begari* (forced labour) from the rāyā. When the Chamars (untouchable leather and field workers) sat in rāyā on the land of *jemindars* (land-holders), they had to do all sorts of work, and they had little money and education.

It was agreed by all, both the Rajput rāyas and the non-Rajput rāyās, that Khalapur was 'a Rajput village' and that Khalapur belonged to the Rajputs. The other caste communities had all been invited in by the Rajputs, and even though some might have been there for ten generations, they still could be evicted at any time. One of the ploys in enticing a community of Washermen or Weavers to live in the village had been the offer of house-sites, land upon which they could build their houses. It was well known to whom the land belonged, which Rajput minimal lineage, and the rāya had the right to ask the rāyā to work for him; he also had the right to the cowdung and other waste that might be composted as the rāyā accumulated it; he also retained the right to take back the land at any time. One of the rights which the rāyās attained with the passing of the U P Zamindari Abolition Legislation in 1952 was the ownership of their house-sites; the rāya could no longer evict the rāyā.

The *khasgar* is a 'master'; the *lagdar* is a servant, one who fetches and carries (from the Hindi verb *lagna*). One of the Rajput elders used these terms in the following statement:

> With growing cane, the khasgars profited. They grew more cane and got more money. Lower castes benefited, because khasgars were rich, and thus, they employed more labour. If the khasgars in a country are happy, everyone else will be happy. Even the shopkeepers in a city are dependent on the khasgars...The khasgars produce the grain and sell it, and the rest of the world buys it.

The core of a local village caste system is the exchange of services that go on between

specialists of different castes. The second largest caste in Khalapur was and is the Chamars, once leather-workers and now mostly agricultural labourers (*mazdurs*). Some of these, as well as men from other castes, used to be *halis*, ploughmen, who did the ploughing of a khasgar's fields as well as other land cultivation. His wife, a *haldan*, did the grinding of grain and other heavy household chores for the khasgar's wife.

Seven of the Khalapur castes were engaged in the *jijman-kamin* (patron-worker), more commonly referred to as *kirsan-lagdar* (farmer-servant) relationships. These were the Washermen, the Barber and his wife, the Sweepers and their husbands, the Potter, the Carpenter, and Water-carrier. The seventh, the Brahman, was never referred to as a lagdar but rather as a *purohit*, a household priest; he came to do *pujas* (religious offering to gods) within the women's quarters on almost two dozen Hindu holidays; his wife sometimes helped in the jijman's kitchen, and groups of Brahman women usually sang at weddings and birth ceremonies of the jijmans. Payments to these lagdars varied, but all received three *dharis* (about 30 pounds) of grain every six months. Since each lagdar served several jijmans, they earned almost enough grain for their families in this way. The Brahmans had their own land; the Water-carriers had bits of land. All the others were landless. The Sweepers got daily mid-day meals from their kirsans, yearly sets of clothing, food at the time of all festivities (religious holidays and life cycle rites such as marriages and birth ceremonies). All lagdars had the right to get fodder for their animals and tender leaves of vegetables to make cooked greens from the khasgar's crops, and to graze their animals on the khasgar's fallow fields. When we asked one Rajput elder if a Potter wouldn't be better off selling his pots for cash, the Rajput elder listed for us all the sanctions which could be brought to bear to make it clear to the potter that he should supply his khasgar with pots and not attempt to find other outlets for his product. These included not allowing him or his family to defecate in the khasgar's fields, or to graze their donkeys there, or to let their donkeys drink in the canal going through the khasgar's fields.

The *uncha-nicha* system of castes, the high-low system, refers to a system of dirt and pollution and involved rules for untouchables and lower castes both for keeping their distance, not touching higher castes, and not expecting the higher castes to accept food or water from them. Chamars are *niche*, low, because they are dirty. In the *bara-chota* (big-little) system, the terms have to do with authority and the monopoly on physical force. The *bari* castes command the *choti* castes, and it is their duty to use physical force to ensure obedience if necessary. To a considerable extent physical force was threatened or used to ensure that the *choti* castes remained *nichi*, that is low and dirty (see Kolenda 1978 for more details).

The Rajputs in Khalapur very much fancied themselves to be just what their name means, "sons of kings". They believed that their, *dharma*, their religious duty, established at the first sacrifice of the Superman (*purusha*) was to rule and to protect their subjects, as well, of course, as to conquer. It was the duty of the other castes to follow their dharma, whether that of the Brahman priest and religious scholar, or that of a Potter or Weaver. Society would remain in harmony with nature if every caste fulfilled its dharma. The passage in the classic *Bhagavad Gita* which among other Sanskrit religious works teaches about dharma is "Better to do one's own dharma badly than the dharma of another well". One of the Rajput elders whom I interviewed both in 1955 and in 1984 told me this story from the *Mahabharata*, the great Hindu epic.

> Dronacharya was a guru of the Pandavas and the Kauravas. He used to teach them how to shoot the bow and arrow. One day a bhil (a tribal) boy came there. Drona taught only boys belonging to the high *khaps* (castes), not boys belonging to a lower caste (or presumably to tribes people either). The bhil said, 'Teach me, too'. Drona said that he taught only Rajput boys, so he couldn't teach the bhil. That boy went away. He made a figure of clay and called it Drona. Every morning, he would bow before it, and he would start practising with his bow and arrow. One day there were some Pandavas and Kauravas who came there. They aimed their arrows, and he did, too. And the bhil boy defeated them. When Drona heard this he was very upset that his princes should be defeated. He went to the bhil. He said, "Whose *chela* (pupil) are you?" He said, "Drona's". Then Drona said, "I never taught you". Then the bhil boy explained that he had made a clay figure and worshipped it and had practised every morning. Drona said, "All right. I am your guru, but you haven't given me *guru dakshina* (gift for one's teacher)." The bhil boy said he would give him whatever he asked. Drona said, "Give me your right thumb". Of course, without that thumb, he would be unable to shoot a bow and arrow. So that boy gave his thumb. The meaning of the story is: a person who uses arms should only be a Rajput.[4]

In the 1950s I saw the old caste ideology of Khalapur as the combination of a belief in *jatidharma* (caste duty) and Rajput dominance, while the constitutional rights I saw as the Congress government's form of 'utopia', an ideology proposing fundamental changes in the social structure; and I asked how four of the elders, one Rajput, one Baniya shopkeeper and moneylender, an untouchable Chamar elder, and an untouchable Sweeper elder reconciled in their own thinking the contradiction.

The caste ideology of an ordinary person is not a coherent, consistent set of ideas, but is composed of thoughts from here and there heard over the years in the discourse on caste, as well as of observations of events going on around him, or those in which he was himself involved. The content for men of the same age and village is similar although like plaid cloth the pattern made by the various strands of ideas differ for each according to his experiences and his own caste's interests of sufferings. Clifford Geertz has suggested that there are two kinds of theories of ideology, interest theories and strain theories [Geertz 1973: 201]. Among men of different castes, we may expect that the caste ideologies of high caste men are more likely to be interest theories while those of low caste men are more likely to be strain theories.

The four men interviewed I arranged on a continuum with 'ideology' at one end and 'utopia' at the other. The Rajput elder, Hukam Singh, falls at the ideology end as the most conservative, and Jivan Mal, the Baniya, falls at the other end as the most utopian. The two untouchable elders fall in between, Randhir the Sweeper closer to Hukam, and Mithan the Chamar closer to Jivan Mal. Let me turn to the ideologies of each of these men in turn.

Hukam is a scion of the wealthiest Rajput minor patrilineage in the village. His views on caste in the 1950s were the most orthodox of the four men. He said:

> It is written in the *Vedas* (ancient Sanskrit religious hymnals) that there should be particular lives for each caste. There is one for Brahmans and one for Shudras (servant castes). If you believe in your books and act according to what your ancestors tell you, that is good. If you don't, your *karma* has fallen... One's *karma* is to perform the occupation of one's caste. The occupation of the Rajputs is to help the poor and to protect them and not to take other people's women. If their karma falls, they do many bad things. If a Chamar does good things now, he will be born in a higher dharma. Those Rajputs who do bad now will be reborn as Chamars and Sweepers.

Hukam uses argument of the *Bhagavad Gita*: one should do the duty of one's caste. Bad events will occur otherwise.

At the other extreme from Hukam, at the 'utopia' end of the continuum, is Jivan Mal. Jivan Mal, the Baniya, had been active in Congress Party politics in the 1930s. Of the four men, he was the most educated, having eight years of schooling, while Hukam had perhaps four as had Randhir the Sweeper. Mithan Chamar had had no schooling. Jivan Mal knew the Congress programme against caste well. He said,

> The Congress gathered Chamars, Muslims, and all together as one in order to bid farewell to the British. No single creed alone could have done it... That was the basis of the whole thing, equality. Mahatma Gandhi was a Vaishya and Nehru was a *pandit* (a Brahman). They might have thought, "We will keep apart from the untouchables", but they did not... God is with those who do not discriminate. There should not be caste...

Jivan Mal was a Gandhian. Like Gandhi, he tried to live his life according to the four *ashramas*,[5] and when we knew him, he was in the third ashrama; he was a *vanaprashta*,

one who had retired from ordinary life to devote himself to religion. He explained that he and his wife were "like brother and sister"; he had given up sexual activity. Consistent with his religiosity and his Gandhianism was his strict vegetarian diet, but inconsistent with his Gandhianism was his inability to consort with untouchables, to be near them or to take food or drink *from* them or *with* them. It is not surprising that Hukam Singh Rajput the conservative also disapproved of such Congress social intercourse with untouchables. Hukam said,

> Now we have started eating everywhere. At first, we ate nowhere except at the Baniyas' and the Brahmans'. Even there, we ate only fried (*pakka*) food, Ever since the Congress came, even the big leaders eat at the Chamars' and the Sweepers'. What can others do?... I am a modern man. I take both boiled (*kachcha*) and fried (*pakka*) food at the Tagas' and the Jats' (high agricultural castes) and at the Baniyas'. We now even eat at the Goldsmiths'... Even if we object, what are we to do?

So Hukam indicated that he had relaxed his personal prohibitions on eating with some other higher castes, but he could not bring himself to approve of eating and drinking with untouchables and low caste people Aware that the old ways were being challenged, he remains unconvinced, saying:

> The caste system is necessary. As long as the old people are alive, caste will not disappear But the lineages will become badly mixed and the Rajput will keep a Chamar woman, and the Chamar will keep a Rajput woman.

At the other end of the ideology—utopia continuum—Jivan Mal though unable to bring himself to consort with untouchables, nevertheless condemned the caste system.

> [The caste system] is a way of destroying the world. Since the time that caste came to India, India has been under foreign rulers... If the Rajputs are ruling, they keep untouchability restrictions with the Sweepers and the Chamars. So in time of trouble, they will not help the Rajputs. Now we have fallen from our *karma* by non-unity, especially through untouchability.

Jivan Mal's ideology, though strongly Gandhian and anti-caste, nevertheless, included a strand of nostalgia for the old days when the caste system operated ideally, as it should. In those days, he said:

> The Brahmans had hold of the whole world. They were the protectors of the country India was considered the centre of learning. Wherever an Indian walked, people would pick up the dust and place it on their foreheads. It was a land of gods...

Hukam's ideology was consistent. Again aware of the challenge of change with respect to education and middle class jobs for untouchables, he again rejected it, saying:

> [In the past] they were not prevented from being educated simply because they lacked natural ability, but because the leaders would not have liked it. Now the government says all should become one. We are afraid of that.

Now we can't get anyone to work for us. If they are all clerks and gentlemen, who will plough our fields? Even now it is hard to get labourers. It used to be you could get a man for five rupees to work for you. Now they ask thirty or forty... (We asked if one could pay less.) How could we do that? The government helps them. If we try to make them take less, they will sue in the courts.

Hukam expected the worst in the future; just as the *Gita* and other religious sources have taught, the mixture of castes would lead to destruction of the world which would necessitate the coming of a saviour to put things right. He predicted:

When the Congress rule ends, there will be a rule of devils (*rakshas*). The untouchables and the lower castes will rule, and they will trouble the Rajputs and Brahmans. They will then be kept low. Then (god) will come... During the rule of devils, there will be no caste, and there will be no dharma and karma. Then *Kalkiavatara* (god in man's form) will be born. Then he will start castes all over again.

The untouchable elder closest to Jivan Mal in his views was Randhir the Sweeper. He also approved of the Congress' goal of equality, but in 1955 he had begun to doubt its attainment. He said:

These Congress people said that we are all equal. So why don't they give us equal treatment? For seven years they have been in power, and they have done nothing. Untouchability still goes on... these Congress people are not good in their hearts.

He was especially doubtful that caste discrimination would end in the village. He remarked:

It is written in books now that they must let everyone take water at the pump, but they do not. We have to live in the village, so we don't want to make reports against people and turn them against us.

His helplessness in the village where the dominant Rajputs continued to hold sway in the traditional way is voiced in this passage:

We consider the Rajputs to be our kings. Nobody can do anything against the kings, unless they unite against them...People don't unite because they are weak. We are poor and dependent upon the Rajputs for animals, food, and everything.

Unlike the untouchable Randhir Sweeper, untouchable Mithan Chamar did not approve wholeheartedly of the Congress and Gandhian attempt to do away with the rules of untouchability. He was already anguished concerning the frequent exploitation of Chamar women by Rajput and higher caste men; now, if there were not restraint from the feelings of disgust for untouchables, the untouchable women would be troubled even more. He, like the other three men, idealised the past when the local caste system worked well. He said:

The Rajputs and low-caste people should be like parents and children. It used to be that if anyone else troubled us, the Rajputs would protect us. Now they themselves oppress us.

That the higher castes in Khalapur have tried equality and rejected it, is indicated in Mithan's account of the first meeting of the new democratically-elected village council. He was an untouchable member of the council. He said:

When India got its independence, there was an order from the higher authorities. This is when the elections were being held and then people started living more in unity because of that order, for about six weeks. They even started letting us take water from their wells in the fields, and during council meetings all fifty-two members used to sit on cloths spread on the ground. Then about three months after independence, Rajputs started sitting on cots and made the lower castes all sit on cloths on the ground. Still later, even the cloths were not spread and the old state of affairs was resumed, with Rajputs and higher castes on the cots and lower castes on the bare ground.

So Mithan, like Randhir, held little hope that the strictures of untouchability would be relaxed in Khalapur.

My analysis of the four elders' ideologies in the mid-1950s had six conclusions:

First, enthusiasm for equality had dissipated.

Second, the concept of progress was strikingly lacking. All four men looked back to golden days of the past either when Rajputs were rulers (for Hukam) or when Brahmans ruled (for Jivan Mal) or when Rajputs were parental toward their servants (for Randhir Sweeper and Mithan Chamar).

Third, three of the elders, Hukam Rajput and the two untouchables, felt victimised and helpless.

Fourth, all set conditions for the future success of the government. Jivan the merchant and Randhir Sweeper required inter-caste equality. Hukam Rajput required power for Rajputs. He and the Chamar predicted an era of evil manifested in inter-caste sexual relations and inter-caste marriages that would end in the destruction of society and the coming of a saviour to set things right again.

Fifth, no one except Hukam Rajput any longer expected people to follow the dharma of caste occupation,

Sixth, none could envision a social order free from restrictions on inter-caste social intercourse.

Clearly, the issues of the 1950s were educational and occupational access for low-caste and untouchable people, and practices of untouchability like using wells, sitting as equals or sitting hierarchically, giving and taking of food and water, sharing waterpipes together, and so on. My feeling in the 1950s was that villagers in Khalapur could not conceive of a society that was not caste-organised. Equal treatment was a foreign urban Congress Party issue. Occasional politicians came and advocated and even demonstrated equality, but rural Rajputs could ignore it and untouchables had to suffer non-enforcement of their rights if they wanted to continue living in the village.

In 1984 two of the four elders were still alive, Hukam Rajput and Mithan Chamar, and among other conversations I had wi[th] each, I reinterviewed them with the sa[me] Caste Sanctions Interview Guide. In t[he] 1950s, the impact of education up[on] Khalapur was slight, but over the past thir[ty] years, all of the men whom I interviewe[d] four older men and five younger ones h[ad] sons or grandsons who were high schoo[l or] even college-educated, or were high[ly] educated themselves. To replace Jivan Ma[l] I interviewed Durga Lal, a Baniya, a ma[n] in his late fifties or early sixties. When [I] asked him about the origin of the cast[e] system, he said, "Ever since the world ha[s] been populated, there have been jatis". Whe[n] I asked, "Was there a creator?" he said, "[A] *sciencewala* can tell you".

Durga Lal, who had eight years of educa[-]tion, has six daughters and four sons. Fou[r] of the daughters studied to eighth class, on[e] to twelfth, and the youngest was in tenth i[n] 1984. Durga has one son who finishe[d] twelfth and works in his shop. The othe[r] three sons work outside the village. One ha[s] a BSc degree; one is an engineer; and on[e] is an MA science teacher, perhaps th[e] *sciencewala* Durga had in mind. Durga, i[n] fact, has lots of *sciencewale* in his family.

The impact of education has changed the discourse in the village from phantasies about the past to expectations of the future. *Parivartan*, change, is the word on the tongues of the young high shcool- and college-goers, of the teachers and office workers.

Four of those I interviewed in 1984 were aged late-fifties to eighties. One of these was Durga Lal merchant who had eight years of education, unusual for a man in his late fifties or early sixties, but who had, nevertheless, lost confidence in the worth of his own opinions saying, "I don't have much 'education". The eldest of the four older men interviewed was Raghunath, a Goldsmith I remembered well from thirty years ago. Raghunath is one of the few I spoke to who still talks about the etiquette of untouchability. When we asked, "Is *jat-pat* (caste system) a good or bad way of ordering society?" he said, "How can I tell? It is from before (*pahale se*). Actually it is good (*achcchaa hai*). The lower castes that visit me cannot sit on my cot, but sit on the ground—the Sweeper, Barber, Washerman, Weaver, Oilpresser and Tailor."

Hukam Singh Rajput, the conservative interviewed in 1955, now in his seventies, has changed his views drastically since thirty years ago, saying that "caste is rotten; it is not right", but his statement seemed perfunctory, especially as he immediately went on, saying, "The difficulty is that you have to have different *hukkas* (waterpipes)", and he reminisced about the old days when he had no place to stay or to eat when he had to spend the night in a nearby Chamar village.

One of the three teachers whom we interviewed, a Rajput schoolmaster, in contrast, said that the caste system was a bad way to order society. He then commented, "In some

amilies now *achuts* (the unclean, that is, un-ouchables) can prepare food and serve it, repare *hukkas* for *chaudhuris* (the impor-ant men). They can sit on our cots.'

But the issues in the discourse on caste ave changed. No longer are the issues of ccess for facilities, inter-caste etiquette and ntouchables' rights to jobs and education. These changes have been absorbed. When ve asked Durga Lal, "Do you know of some astes advancing? What do you think of a Chamar teacher or a Nai (Barber caste) doc-or?" he said, "I can't tell, but you know verything is being done for these (the un-ouchables) to bring them up". We asked, 'From the village?" Durga Lal did not reply, but his son who works in the shop said, 'From the government". There are now un-ouchable teachers and *babus* (clerks) living n the village. People now live with the ideal of egalitarian etiquette, even though they feel uneasy with it and probably do not practise it. But the issues now are new issues in a new discourse on caste. These are inter-caste marriage, a questioning of caste as a social system, and the expectation of social change.

When I began to ask Hukam Singh Rajput the list of questions on the Caste Sanctions Guide, he launched immediately into the issue of inter-caste marriage. As a man now in his seventies or eighties, he still accepts the idea that castes are different species. Within inter-caste marriage, he said, "The offspring will be changed. Like a donkey mates with a horse, a mule is born, not a donkey."

Raghunath Goldsmith said that inter-caste marriage simply "isn't done. One must marry in one's own caste."

Mithan Chamar, also now in his seventies, said, however, that he wouldn't object to a Rajput woman marrying a Chamar man, "but", he exclaimed, "the Rajputs would object!"

Among the younger men, those in their thirties to fifties, however, attitudes are different from those of the elders except for the untouchable Mithan Chamar who agrees with the younger men, all of whom pronounce jat-pat a *kharab* (rotten) or *bahut bura* (very bad) way of ordering society. The young men are a Rajput high school teacher, a Baniya school teacher, and an untouchable Sweeper primary school teacher. One is a Water-carrier by caste who failed tenth class as a boy; he works as a *chaprasi*, a peon, in the high school. He is seeing to it that his son is educated, having had a study room built on the roof of their small compound for the boy's sole use. And the fifth is one of the first educated men among the untouchable Chamars, a man we knew as a youth in the 1950s who got his education under very difficult circumstances in the late 1930s and 1940s; he and the three other untouchable boys in the school had to sit separately from the others, and were prohibited from drinking at the school pump; his father suffered periodic beatings by high castemen, and was made to do unpaid labour, because he kept his son in school.

Here are these younger men's comments on inter-caste marriage:

(1) The Rajput high school teacher said: "Some people say you should not marry in other castes. If it happens by chance, they become angry. With an educated person, an educated bride and groom if they do so, I think, in society, it is not thought so bad. Our K S [the late principal of the high school, an outsider, a government—appointee, but a Chauhan Rajput and principal for a quarter of a century]—his elder son married a girl of Kayastha caste. When K S and his elder brother came to know they were happy; they did not object."

(2) The Baniya school teacher said, "I don't think it wrong, but *samaj* (society) does not accept it. Because of social pressure, even if one wants to marry a son or daughter out of caste, one cannot. Men of one's caste brotherhood apply such pressure on any of their caste people who try to marry into another caste; those who do so have to give up their own caste. In this village, there were such marriages long ago. One such family was thrown out of our caste for a long time. All recognised them as people among whom an inter-caste marriage had taken place. A S[a neighbour], his grandfather [father's father] married a Sweeper woman. He defied his caste brotherhood. He just brought her and kept her. He had had *pheras* [been properly married] with a Rajput woman. He kept both women at once. They lived separately. At first, he kept the Sweeper outside and then in the cattleshed. She was never in the women's quarters of his family.

"Then four years ago, a Rajput boy here married a girl whose caste is not known. We presume she is a Chamar. He is a supervisor in a factory in G [a city in the district]. He is not allowed to come into the village nor does anyone go there. Two months after marriage he came with his wife. They let him stay the night only, then sent him away next morning."

(3) Ramlal, the Watercarrier caste schoolpeon said, "I would like people of different castes to marry, but that is my own individual idea. I wouldn't mind my son marrying into some other caste, but I have relatives who would object."

(4) Tirlok, the untouchable Sweeper school teacher, said, "That is the best thing. I am not averse to that. I would like that so that all *jats* (castes) are broken up. Under Sanjay[6] they started a movement—if a lower caste marries a higher caste, the couple would, be given presents by the government."

Thus, these men represent a range of opinion, but inter-caste marriage is still something outside, something that might be done by educated people in the city, advocated by the government in the city, but not yet something that might be acceptable in Khalapur. But this was very much the status of egalitarian inter-caste etiquette and equal rights to jobs and education for untouchables in the 1950s.

I was very much surprised at the unanimity among the seven younger men against caste as a system; among the older men Mithan the Chamar joins them saying, "It is harmful (*nuksan, phaida nahin*). Each caste keeps away from the other. [We: would it be better if they did not keep separate?] Yes, there would be more love (*prema*) if they were not so separate."

As mentioned above, even Hukam Singh reluctantly says the system is *kharab* and *thik nahin* ("rotten" and "not right"). Nowadays, only very elderly folks like Raghunath in his eighties can still say the system is good, and men in their sixties like Durga Lal may just hold their tongues.

In the 1950s I felt Khalapur villagers could not conceive of any different social system. To quote the remarks of the younger men:

(1) The Rajput high school teacher said caste was a bad way to order society, and he went on as mentioned above about untouchables even serving food and the *hukka* to high caste people. He added, "untouchable Sweepers and Chamars are well-educated. I had a Sweeper class fellow who is in the central District administration military office (as a lawyer). He goes to the *pradhan's* (village headman) and *chaudhuri's* (important man) houses. He takes tea with us (Rajputs)."

(2) The Baniya school teacher pronounced the caste system "kharab". He said, "According to my views, it is wrong. Every human being was created by a creator (*usi*). It is a *nuksan* (a loss or harm) to a human being to think of another as lower than himself, because of his work."

(3) The Watercarrier caste school-clerk also said the system was "kharab", going on to say, "We are all human beings. A man should be treated like a man. There is difference only according to work."

(4) The Chamar educated "first" also said the system was "kharab", saying, "Among human beings, God made all of the same blood, so why this difference between one and another".

(5) The untouchable Sweeper primary school teacher was the most impassioned in his response to our question, "Is the caste system a good way or a bad way of organising society?" He said it was "very bad. Our country cannot progress because of this. Indira Gandhi is fighting against it. I am as educated as a Brahman and Rajput. I read religious books. I have education and give education. Yet only under government pressure will a Brahman eat with us. In his heart, he thinks, 'He's an untouchable Sweeper!' Indira Gandhi is against it, wants rid of it, so the country can go forward."

The species kind of thinking done by Hukam is rhetoric of a past discourse on caste. Ideas about equal etiquette and equal rights are becoming ideology in Khalapur. The discourse concerning inter-caste marriage, the questioning of caste as an entire system, the expectation of change, are parts of a new utopian ideology.

Appendix I

Caste Sanctions Questionnaire

1 What is the origin of the caste system? How did it start?

2 What is the basis of the caste system? How was it that people doing different work were divided into castes? How was it when there were four varnas originally, there are now thirty-six castes? How did *chutchat* (untouchability) come about?

3 Is *jat-pat* (caste) a good way or a bad way of ordering society?

4 Do you agree or disagree that one's virtue depends on fulfilling one's own caste's duties not on doing the duties of another caste?

5 What do you think of people who do not not their caste's work, but do some other kind of work? Such as a Chamar school teacher, or a Dhobi (Washerman) doing farming, or a Nai (Barber) doctor?

6 Is it is wrong to do work which is not your own caste's work? If you don't want to do your own caste's work, is that wrong? What advice would you give to a member of your caste who wanted to do some other work?

7 What is the origin of untouchables? How did they get started? Why is it bad for people of different castes to marry? Who were the ancestors of the untouchables?

8 Do Rajputs and Brahmans have high positions, because of their good *karma* in past lives? How did their high position come about?

9 Do you agree or disagree:

(a)"The highest duty of the Shudra is to serve a Brahman."

(b)"Killing a Brahman is the worst crime on earth."

(c)"A Brahman be he ignorant or learned is a great divinity."

10 What is *karma?* What is *dharma?* How are *karma* and *dharma* related to caste?

11 Why are some castes lower than others? Are some castes lower because they allow widow-remarriage?

12 What would you do if your Nai (Barber) or Bhangi (untouchable Sweeper) refused to work for you?

13 Is it necessary for one's *ijjat* (honour) to have a Bhangi? a Brahman? a Nai? a Dhobi? a Badhai (Carpenter)? a Kumhar (Potter)? Would you give up your Bhangi if you no longer needed him?

14 Is your own position in the caste system due to past deeds? Due to past deeds in past lives?

15 What do you think of various castes' trying to improve their position?

Do you know of any caste groups' trying to improve themselves by taking up the wearing of the sacred thread? by giving up widow-remarriage? in other ways? giving up meat?

Notes

[Paper originally read at the south India seminar of the Asian Studies Programme of the University of Texas at Austin, September 24, 1986. Submitted to Richard Lariviere, director of the Asian Studies Programme, University of Texas at Austin, for his information, before additional needed revisions.]

1 My research in Khalapur between October 1954 and June 1956 was supported by a

Post-doctoral Fellowship from the Cornell University India Programme; writing of a number of articles on Khalapur including 'Changing Caste Ideology. . .' was supported by grants from the American Philosophical Society (in 1957-58) and the American Association of University Women (in 1958-59). The research in Khalapur from January to June 1984 was supported by a grant from the Smithsonian Institution. I am grateful to all of these organisations.

2 The figures on high school enrolment were copied from the school records by Shyamsher Singh, a high school teacher.

3 The figures on primary school enrolments for 1955 are taken from Minturn and Hitchcock 1966: 91. The figures for 1984 were collected by a research assistant, Deepika Anand.

4 Hukam Singh made reference to the same story in 1984, but then he only said that Dronacharya had taught Arjun, the Pandava warrior-hero of the *Mahabharata*, one of Dronacharya's pupils referred to in the 1955 story. In 1984, he did not mention the bhil boy or his thumb.

5 The *ashramas* are the four stages of life which Hindu religious law books prescribe for upper caste men. For one-quarter of his life, he should engage himself in religious study with a guru. For one-quarter of his life he should be a married householder, raising children. For one-quarter of his life, he and his wife should retire to the forest and pursue religious ends; this is the *vanaprashtha ashrama*. For the last quarter of his life, he should be a renouncer, beg for his living, and seek union with the absolute. (Basham 1954: 158-59).

6 Sanjay Gandhi, who died in 1980, was the younger son of prime minister Indira Gandhi. During the 1970s, he was head of the Congress Party's youth organisation, and he worked for many social and economic reforms, including abolition of caste abuses. Here Tirlok refers to the newspaper reports of government- approved weddings between people of different castes.

American Forestry Professionalism in Third World

Some Preliminary Observations

Louise P Fortmann
Sally K Fairfax

The inflexible technical professionalism, arising out of the American forestry tradition's commitment to comprehensive, large-scale planning, is one of the prominent reasons for the failure of international forestry projects, particularly in developing countries.

Rigid adherence to the fundamental tenets of professional forestry—technical expertise, marco-level planning, promotion of commercial fibre production, and a narrowly biological perception of forestry—has led to a blinkered world-view that ignores relevant social factors. This paper pleads for a re-evaluation of this tradition as a precondition for the success of forest development projects.

I

Introduction

ETHNOCENTRISM and western biases have long been identified as sources of inappropriate and unsuccessful development efforts. Robert Chambers (1981) applied these more general lessons to professional culture in his discussion of the effects of the biases of urban-based professionals on rural development projects. Chowdhury (1982) articulated the centre of this concern with her statement that "experts and their knowledge often have built in biases and assumptions which need to be re-examined in relation to the new situation and people concerned".

Forestry offers an interesting case study of professional ethnocentrism and its adverse effects. The ideology of renewable resource management is so comprehensive, so explicitly preached, and has, for a long period of time, been so fervently adhered to, that it provides a particularly useful focus for this type of inquiry. This essay takes a preliminary step toward evaluating the impact of the forestry profession's much discussed ideology [Behan, 1966, 1975, 1977; Gould, 1964; Hays, 1960; Kaufman, 1960; Twight, 1983, 1984] on development projects.

Over the last decade forestry projects have emerged as an increasingly important component of international development projects. Rising amounts of international donor money and host country budgets are being applied both to the international shortage of fuelwood and to the apparently incresing rate of deforestation with its concomitant evil of erosion [Braatz, 1985; Foley and Barnard, 1984]. Yet many forestry projects have been viewed as failures or as socially harmful [Foley and Barnard, 1984; Hammer, 1982; Mnzava, 1983; Shiva et al, 1984; Fortmann, 1988]. These failures and harmful effects have many causes. This paper argues that the American[1] forestry tradition contributes to them. The tenets of the profession emphasise a kind of technical professionalism which appears to leave practitioners ill-prepared for work in the developing world. It points to regularities in forestry orthodoxy which appear related to implementation errors which American foresters (and third world foresters trained in American institutions) are likely to make.

We are not so resolutely reductionist as to argue that the culture of American forestry 'causes' implementation errors in third world settings, nor do we pretend that foresters are uniquely likely to succumb to trained incapacities. All professionals are trained to view the world in characteristic ways which will enable them to define problems in terms of solutions that they are qualified to apply. Nor are we arguing that foresters are basely motivated in believing that their skills and insights will help to alleviate resource mismanagement and human suffering. Nor do we question the commitment of individual foresters to improving the human condition. We do, however, believe that foresters could be trained so as to minimise negative effects of the profession's catechism. Finally, we believe that those who work with foresters may find it useful to have some insight into the principles of the faith of forestry.

For the present discussion, we must put some boundaries on our generalisations. We will therefore simplify our argument by asserting that the operative tenets of American forestry professionalism are defined by values which characterised the progressive era. Those early decades of this century are commonly and appropriately associated with the ascendancy of Theodore Roosevelt and Gifford Pinchot. Largely as a result of their efforts, the forestry profession was imported from France and Germany to the United States [See Gould, 1964; Behan, 1975] became a national crusade, and adopted the durable tenets which still shape it. Those remnants of the crusade often create difficulties for foresters who need to understand, evaluate or work in developing countries.

Section II of this paper examines four features of forestry's progressive era heritage. Its primary tenet is a commitment to technical expertise as the goal and criterion for public and private decision making. From it arise three other principles: (1) the tenet of large scale, comprehensive government planning for resource management; (2) the related doctrine emphasising fibre production for commercial operators; and (3) the view of forestry as a predominantly biological undertaking. Section III of the paper will discuss the implications of such professional ideology in the growing field of forestry for development. We will argue that it puts the average American-trained forester in the third world at a disadvantage when trying to discern (a) who is actually practising forestry; (b) to see what uses are made of what trees; or (c) to understand the rules which govern the use and allocation of resources including trees.

II

Progressive Era Tenets and Contemporary Blind Spots

Samuel P Hays' (1960) *Conservation and the Gospel of Efficiency* is so universally acclaimed that we feel no qualms in relying primarily upon it here for a definition of the major planks in the forestry profession's intellectual infrastructure. Hays has described the progressive conservation movement as follows:

> The broader significance of the conservation movement stemmed from the role it played in the transformation of a decentralised, nontechnical, loosely organised society, where waste and inefficiency ran rampant into a highly organised, technical, and centrally planned and directed social organisation which could meet a complex world with efficiency and purpose. This spirit of efficiency appeared in many realms of American life, in the professional engineering societies, among forward looking industrial management leaders, and in municipal government reform, as well as in the resource management concepts of Theodore Roosevelt. The possibilities of applying scientific and technical principles to resource development fired federal officials with enthusiasm for the future and imbued all in the conservation movement with a kindred spirit. These goals required public management, of the nation's

streams because private enterprise could not afford to undertake, of the western lands to adjust one resource use to another. They also required new administrative methods, utilising to the fullest extent the latest scientific knowledge and expert, disinterested personnel. This was the gospel of efficiency [Hays, 1960: 265-66]

'Scientific forestry' Hays argues, 'was a haracteristic example of the new technoogical age which emphasised large-scale, ong-term planning and management in ooth private and public affairs'. The forestry rofession bears a number of earmarks of hese progressive era beginnings. None have gone unchallenged, especially in the recent era of environmental awareness. Yet, they remain unmistakable characteristics of the profession.

(a) *Tenet One: Non-Partisan Technical Expertise is the Basis for Decision Making:* The fundamental feature of the conservation movement and the forestry profession's ideology is the proposition that decisions concerning resource management should be made by technically trained experts. "Who should determine the goals and methods of federal resource programmes? ...Since resource matters were basically technical in nature, conservations argued, technicians, rather than legislators, should deal with them" [Hays, 1960:3].

Appalled at what appeared to them as a century in which private enterprise exploited the political process to ravage the western territories, Pinchot's forest service disciples sought to protect forest management from the tawdry pull and haul of the politics. "Pressure group action, log-rolling in Congress, or partisan debate could not guarantee rational and scientific decisions. Amid such jockeying for advantage with the resulting compromise, concern for efficiency would disappear" [Hays, 1960:3].

This commitment to what Herbert Kaufman has characterised as 'non-partisan technical competence' has unsurprising consequences. One is that it forces the forester to draw very clear lines between the professional and the non-professional. Foresters are scientifically trained to be managers. Non-professionals are not considered to be foresters or managers.

A second unsurprising consequence of this commitment to expertise has been a tendency for foresters to disregard or denigrate local resource managers and users. The forester recognises neither the local user's knowledge about local conditions nor his/her definition of the resource and priorities concerning its management. This may reflect in part an anti-local sentiment, since it is the local residents' use of the resources which on first glance appears responsible for the crises which foresters must resolve. But it is perhaps more a pro-professional sentiment which simply does not conceive of expertise outside its own boundaries.

Nevertheless, the locals are in no way peers. Lacking professional expertise, they are, in the terms of forestry orthodoxy, perforce involved in management as political actors, seeking some kind of advantage, some distortion of the technically correct decision which would meet their own needs and preferences. It is the forester's job to base decisions on science, hence to exclude such political influences from the process.

One costly consequence of this set of assumptions is that it has traditionally obliged the forester to choose 'for the resource' when confronted by a conflict between local needs and technical priorities. Thus foresters have historically put their commitment to technically sound resource management above the needs of impoverished range users in the American southwest. West (1980) and de Buys (1981) have chronicled similarly distressing tales of insensitivity to Hispanic range users through more than 70 years of range 'improvement' in Arizona and New Mexico. Convinced that the communal range allocations traditionally made to groups of Hispanic permit holders led to overuse of the resource, the forest service has worked for decades to phase them out while acknowledging that the permit holders relied upon them for protein in their diet. This is not because they were in favour of starving Hispanics but rather because they were trained that to deviate from the 'biologically correct' solution was wrong. Not surprisingly, these attitudes did not endear Pinchot's Yale-trained foresters to the local communities when they went west after 1905. Contrary to song and story, the local residents whom they encountered were more likely to be livestock operators than the loggers they were ostensibly trained to deal with [Roberts, 1963; West, 1980]. Because the large livestock operators were in a position to withhold critical political support from the fledgling forest service,[2] the foresters were obliged to deal sympathetically with them [Roberts, 1963; Fairfax, 1984a; Nelson, 1980] but it was clearly regarded as a defalcation [Voigt, 1976].

Even after the environmental decade of the 1970s[3] the principle continues to be well established within the profession that foresters are 'the' experts and the local residents and their preferences are viewed as potentially threatening to the forestry mission. This is evident in current guides to public involvement in forest planning. The forest service makes clear to its personnel that information regarding public preferences is an important component of the professional's decision making, but still the professional forester retains the actual management authority [Achtermann and Fairfax, 1979; Behan, 1977].

(b) *Tenet Two: Large Scale Comprehensive Government Resource Management:* This same pro-professional bias is related to a second tenet of the professional forester: the commitment to large-scale, national action to achieve comprehensive resource planning and management. Hays' (1960) reference to 'central planning' by 'federal officers' is generally appropriate to the progressive era. Particular historic circumstances surrounding the public domain make them especially relevant to the conservation movement. The initial focus of the progressive era conservation movement was defined by the fact that the federal government already owned most of the land which the progressives wished to conserve. The dominant government policy for most of the 19th century had been to give the land away to states, corporations, and individuals in order to encourage orderly settlement of the western territories [Gates, 1968; Peffer, 1951]. Conservation advocates blamed that 'disposition' policy for what they viewed as the waste and ruin of western resources. As they pressed for a change in public domain policy, it was almost inevitable that the conservationists would fall into the pattern of government forest management then being imported from Germany. This they did; almost without discussion,[4] their position became that the forests ought to be retained in federal ownership and managed by government foresters.

In addition to government ownership, this federal involvement had three other important components: national priorities, government compulsion and the scale of operations. The first is a variation on the anti-local themes discussed above. The conservation movement's goals were *national* priorities which had to be achieved on the retained publicly owned lands over the objections of the local citizens.[5] A second virtue of government involvement was that it would provide a compulsion without which conservationists feared (correctly as it turned out) that their religion would not be widely adopted. Ownership of resources was in this sense critical. Regulation of land use and resource extraction practices on private land which are now common place were viewed as takings of private property at the turn of the century.[6] Indeed federal regulation of public domain land was so novel a thought that for Pinchot to impose a fee for grazing livestock on national forest lands presented grave constitutional issues which had to be resolved by the US Supreme Court [Dana and Fairfax, 1980].

Pinchot spent much of his career working against what he saw as the selfish, evil industrial interests who would not practise 'forestry in the woods'. He was forced to take that rather unsophisticated position in order to distinguish himself from his predecessor who ineffectually (in Pinchot's eyes) but accurately observed that forestry would not be practised on private lands, and investment in reforestation of private forests would not occur, until the existing forests had been utilised to the point that there was some hope for return on the investment. Although Pinchot attributed the reluctance of industry to invest to moral turpitude, it is in fact true that forestry was not practised to any extent on private lands until it began to make economic sense as an investment. Therefore

the compulsion of government involvement and government land ownership was mandatory if forestry were to be practised anywhere in this country at the turn of the century.

Interestingly, this conflict between Fernow's economic insight and Pinchot's preoccupation with practising forestry at any cost continued to rage throughout Pinchot's long life, and it still is at the heart of major forest policy issues. Pinchot fought for two full decades after he was fired as chief of the forest service in 1910 for the enactment of federal laws which would compel private forest owners to practise what Pinchot considered to be sound forest management. These owners demurred on the grounds that they could not recover their investments because there was too much standing timber to justify planting more. Pinchot fought constantly with William Greeley (his successor in the chief's office) who advocated a co-operative and educational approach to recalcitrant timber operators [see Clepper, 1971; Greeley, 1951]. During the depression the forest service recognised that there was some merit in the argument; hence they advocated federal purchase of over 150 million acres to facilitate the practice of forestry on (formerly) private lands [Copeland Report, 1933]. Today, some 70 years later, the forestry profession is still concerned about private owners. 'NIPFs' (non-industrial private forest owners) continue to resist all kinds of inducements including the forest service sponsored programmes to encourage practice of forestry in that ownership category [Romm et al, 1983]. Only in the last three to five years has the argument Fernow made in the 1880s—when it is profitable for small woodlot owners to manage their lands for trees they will do so, not until—been given much credence. Meanwhile the current debate over 'below cost timber sales' suggests that many foresters continue to believe that forestry should be practised no matter what the price.

The third major attraction of government involvement in conservation was the anticipated scale of the undertaking. This commitment to large scale operations appears to have at least two major facets. First, conservation and wise use of western resources seemed to require investment and management which outstripped the resources of private citizens, private corporations, or state government. There was ample empirical evidence in failed private and state efforts to develop irrigation programmes to suggest the necessity of federal government involvement [Dana and Fairfax, 1980.]

The second facet of scale is another restatement of the anti-local theme of the profession: comprehensiveness; large scale projects would dilute the regional and local position and put resource management on a footing which would permit rational management decisions. The progressive assumes that rationality requires comprehensiveness; management to meet local or non-comprehensive priorities is inherently non- or ir-rational. Kaufman's (1960) classic study, *The Forest Ranger,* explored the apparent contradiction between the forest service's nominal embrace of decentralised decision making and its fundamental commitment to comprehensive planning. The solution, more insidious in the present context than in Kaufman's description, is the 'pre-made decision'. The forest service can delegate responsibility to the local level because foresters are sc heavily indoctrinated with the core values that geographic location of authority will not alter outcomes.

(c) *Tenet Three: Fibre for Industry:* There is nothing inherent in the progressive era tenet of expertise, or in the tenet of large scale, rational, comprehensive government resource planning and management which would require a professional commitment to timber production as opposed to any of the other potential forest products. The emphasis on timber is almost wholly a product of Pinchot's advocacy of forestry. To Pinchot, forestry was predominantly (but not exclusively) silviculture. His definition 'won' over alternate definitions because of his political skills and powers.[7]

However, once the 'silvicultural bias' [Olson, 1971] was introduced by the German-trained silviculturalist, Pinchot, the momentum of the progressive era's commitment to large scale operations, and the fervour with which Pinchot set out to force sound forest management on a reluctant industry, veered the operation in the direction of fibre production, as opposed to recreation, small scale fuelwood production, fish and wildlife management, pine nut production, generation of lichens for dyes or any of the other potential 'minor' forest uses.

A major goal of the progressive forestry movement (which as noted above, can be distinguished from earlier concentration on watershed protection and Fernow's subsequent lamentations that forestry would not be practised in the United States until timber was in shorter supply) was a wholly fabricated but deeply felt fear of a 'timber famine' [Olson, 1971]. Pinchot's emphasis on 'forestry in the woods' combines with the large scale emphasis to mean forestry in large plantations for commercial production and processors.

This emphasis on timber productivity is also manifested in exclusivity. The society for range management, the wildlife society, the soil conservation society of America, and a whole host of related groups owe their existence to a long period in the history of the society of American foresters when a commitment to trees was seen as necessary to being a real forester. Disciplines or persons interested in forest uses other than commercial fibre production were literally driven out of the society [Fairfax, 1978].

The profession's commitment to large scale fibre production continues to be apparent in many facets of professional life. It begins with forestry education with its primary emphasis on wood and wood production. It is continued in the forest service which places timber production at the [cut off] of the hierarchy of potential uses.

(d) *Tenet Four: Expertise [cut off] Biology/Forestry as a Biological Und[cut off]taking:* Just as foresters' emphasis [cut off] silviculture leads them to undervalue ot[cut off] forest uses, the foresters' notion of fores[cut off] as a primarily biological undertaking le[cut off] them to view the knowledge and experie[cut off] of non-biologists as merely ancillary to [cut off] forestry mission. Political and social fact[cut off] of management are viewed as constraints [cut off] the practice of forestry rather than as [cut off] origin of the goals and values which the p[cut off]fession must achieve. Non-foresters worki[cut off] in forestry—social scientists, economis[cut off] and policy analysts—are typically viewed [cut off] technicians who can solve the foresters' i[cut off]age or 'people problems' rather than [cut off] managers or professionals who can help [cut off] the agenda for forest management whi[cut off] serves people.

There is, further, a tendency within t[cut off] profession to try to contain the particip[cut off]tion and influence of what are seen as 'ou[cut off]side' disciplines. Professional courses [cut off] sociology, political science, and law ha[cut off] only recently been accepted in forestry cu[cut off]ricula. Even now it is the norm to offer su[cut off] non-biological materials in courses taug[cut off] by persons who have been trained as fore[cut off]ters within the forestry school or depar[cut off]ment.

The caution has been reinforced by t[cut off] recruitment of non foresters—anthrop[cut off]logists, sociologists, and planners—into t[cut off] forest service. These outsiders have be[cut off] loyal to their disciplines rather than to t[cut off] agency, advocating on behalf of non-trad[cut off]tional resources such as pot shards, fisheri[cut off] resources and minerals management, dive[cut off]ting planning and management resourc[cut off] and frequently disrupting the planning pr[cut off]cess with public controversy to boot.

This rough sketch of the forestry worl[cut off]view has shown that its roots in the pr[cut off]gressive era leave the profession committe[cut off] to comprehensive large scale rational plan[cut off]ning. This has numerous consequences. Th[cut off] first is that it emphasises professional expe[cut off]tise and tends to regard the experiences an[cut off] insights of non-professionals as irrelevan[cut off] This is both because they are not profe[cut off]sionals and because they are locals. Loca[cut off] users are particularly suspect because the[cut off] are likely to be self-serving, working throug[cut off] the political process to subvert the effort t[cut off] base decisions on rational comprehensiv[cut off] planning and management. However, non[cut off]biological professionals are apt to find thei[cut off] skills equally dismissed as diversions from the commitment to non-partisan technique[cut off] Foresters define forestry as primaril[cut off]

biological in nature because they learned early on that the basic resource to be managed was the trees.

III
The Effects of American Forestry Professionalism on Forestry for Development

While professional forestry in the third world has, like the forestry profession worldwide, focused traditionally on commercial production for fibre, the large subsistence forestry sector has attracted growing attention. In either situation whether the foresters are US-trained citizens of the country or imported Americans, and irrespective of whether the foresters are involved in project design or project implementation of village or farm-level forestry or forestry on large, often government-owned plantations, the orthodoxies of American forestry professionalism can substantially reduce their effectiveness. They prevent foresters from recognising (1) who is using existing forests and trees in what ways; (2) the current use and users of lands proposed for plantation forestry; (3) the social, economic and political effects of their actions. While the effects of the four tenets outlined above are in fact interconnected, we discuss them below tenet by tenet.

(a) *The Tenet of Technical Expertise:* The emphasis on a narrowly defined professionalism reflects the belief (by no means restricted to forestry) that resource management can be separated from resource use. To the forester, loggers are not managers. While we would agree that drinking water from a well does not transform a thirsty peasant into an hydrologist, we argue that foresters overstress the distinctions. A person who makes daily decisions about forest utilisation based on detailed knowledge of the resource and shared community values regarding its allocation is a manager. For example, in subsistence forestry, management is embedded in myriad acts defining use such as observing the norm, sometimes enforced by government edict, that living trees should not be cut for firewood [Hammer, Wood et al]. Similarly, under local norms certain trees are protected from any cutting [Hammer, 1982; Mnzava, 1983]. Protection of trees may be formalised, as in the case of the Sherpas who designated community members to report anyone cutting trees without permission obtained from the village council and fined the offenders [Willan, 1967].

The woman who lops branches for livestock fodder or fuelwood is a manager whose resource use is based on traditional knowledge and an implicit management regime just as clear as 60 year rotation plan. Because the tenet of technical expertise tells them that only professionally trained foresters practise forestry, there is a real danger that many foresters will overlook not only the local person who is practising forestry but also the expertise on which the practice is based.[8]

In fact, village women are the primary users of forest commodities in most developing countries [Fortmann, 1986]. Their day-to-day hands-on involvement with forestry goes far beyond what many professionally trained foresters will ever have. Fuelwood is primarily collected and used by women with some help from children. Bennett (1981) found that in Nepal 78 per cent of the fuel collection was done by women and 84 per cent by women and girls combined [cf Wood et al, 1979]. Women often are responsible for small stock. They may gather fodder by cutting branches or graze their herds in the forest. Women are generally responsible for gathering foods, dyes, medicine, thatch and other 'minor' forest products [Colfer, 1981; Hoskins, 1980]. In the process they develop a forestry expertise on which their livelihood depends. For example, Hoskins (1982) found that women in a Sierra Leone village could identify 31 products from nearby bushes and trees while men could identify only eight.

While in sheer numbers women are most likely to be overlooked, they are not alone in being invisible to forestry professionalism. The men who cut poles for houses, roofs or fences posts or large branches for carving may be similarly unseen students and managers of the forests. This is not to argue that deforestation is not taking place or that subsistence foresters are blameless. The causes of deforestation are familiar from the US history. But even if peasants have "become obliged through forces beyond [their] control [land shortage, population growth] to become the instrument of forest destruction... [they are still] a repository of a wealth of knowledge and experience—of ecological common sense—that cannot be ignored in the quest for sustainable systems" [Westoby, 1982].

(b) *The Tenet of Large-Scale Comprehensive Government Forest Management:* Forester's training for large-scale plantation forestry using a small number of species may lead them to misconceive opportunities for local management. This has both general and specific ramifications. To illustrate, one of the specific benefits of local management is that it can reduce the problems of protecting the trees and excluding people from the land which arise when large-scale government or commercial plantations are established. Such projects may expropriate land which has traditionally been used locally for other purposes. Conflict with local priorities invites trespass or destruction of the plantation which may require considerable resources to prevent. In contrast, under local management, the mechanisms of local social control can be mobilised for protection [cf Esman and Uphoff, 1984].

More generally, many American foresters do not see that trees are part of a production system in which both the trees and the land on which they grow have multiple uses which may interfere with and be chosen over the plantation manager's preferred silvicultural practice. Small-scale local projects can be adapted to local production systems. Trees in small numbers can be planted on residential sites, on field boundaries, on roadsides and on many similar sites without interfering with the existing system or requiring excessive amounts of labour. Small plots of trees can be planted near dwellings where the inhabitants can watch over them. Large-scale plantation forestry is less adaptable.

Finally, the commitment to large-scale, government-controlled plantations has reduced the effectiveness of reforestation efforts. For example, in Bangladesh the principle that the forest department should control forest lands has led to its retention of denuded forest lands despite clear evidence that it is unable to reforest and protect them and equally clear evidence that peasant farmers plant and protect large numbers of trees when they are allowed to live on and farm such land.[9]

(c) *The Tenet of Commercial Fibre Production:* These local user/managers are difficult to see because the uses they make of the forest are likely to be viewed as 'minor' by those trained for commercial fibre production. Activities which fall outside the boundaries of this established forestry tenet are invisible to many foresters who literally do not see trees that are used as hedgerows or 'living fence poles'; trees that provide material for basketry or dyes or medicines or decorations; trees that provide sites for honey barrels; trees that provide fodder; trees that have religious significance; trees that provide shade; or trees that provide human food.

Because many foresters do not see the enormous variety in the use of trees, they frequently do not see the vast number of species that are useful. The definition of forestry as commercial conifer production has long led the California forester to define the mighty oak as a weed competing with the commercial crop. Thus, it is not unreasonable to expect that when they are overseas, they might overlook other non-commercial species altogether. In Botswana, for example, *Colophospermum mophane* is the host to an edible caterpillar during the rainy season, serves as fodder for livestock during the dry season, and provides wood for carving tourist trinkets and for firewood year-round. Since none of these activities are part of forestry orthodoxy, one can easily imagine an American forester levelling an area of mophane trees to plant something 'valuable'. Indeed, Hoskins (1980) describes an area of 'useless' bush, which had, in fact, been the source of food, fuel, medicine, fodder and material for handicrafts especially for the poor, cleared to produce trees for urban fuelwood.

Further, there is no room in forestry orthodoxy for the fact that in some places men and women may have different uses for the same tree or may use different trees for different purposes. Often men are interested in commercial species such as timber or perhaps fruit trees while women are more concerned with trees producing fuel, fodder and food for domestic use [Hoskins, 1982;

Sharma, 1981]. Women in the Sierra of the Dominican Republic use the fibre from local palms (*Sabal umberculifera* Martius and others) to weave containers. Men use the same tree for hog food. When the hog food value of these trees dropped, men began cutting the trees down for construction or for sale [Fortmann and Rocheleau, 1985].

The consequences of the tenet of technical expertise are particularly negative for women because even the forester who consults with local people is still unlikely to consult with the women. At best the result of this is that women's problems and products are not served by projects; at worst, they may actually be destroyed by them. For example, Hoskins (1980) describes a soil conservation project planned by a forester in Mali which involved building berms along the contour of a hill and planting trees. The forester had consulted with the men who held farming permits in the area and obtained their support. Fortunately during a site visit it was discovered that the hillside was not badly eroded because it was already terraced with crude stone walls. The proposed project would have destroyed these terraces which had been built by women who gardened on the land for which their husbands held the farming permits. Moreover, in a few years the trees would have shaded the land, making it useless for vegetable gardening.

(d) *The Tenet of Forestry as a Biological Undertaking:* The foresters' faith in technical solutions to biological problems ignores the fact that management in developing countries often confronts complex political issues not readily amenable to simple biological solutions [Cernea, 1981; Westoby, 1983a, 1983b]. The practice of forestry can be a powerful political or economic tool. Yet many foresters overlook the social institutions which affect and are affected by their actions.[10] For example, foresters frequently ignore the social organisation of property, particularly the systems governing trees and land. Yet land and tree tenure are critical for forestry because of the relatively long period of time necessary for the cultivation of most trees. Foresters may fail to perceive the rules governing the use and allocation of resources including trees because they run counter to their beliefs about property. Many American foresters are committed to the ideology that all property is private unless held by the government. In this ideology, once ownership is established, the owner has clear rights over what happens to and on the property. This is not even true in the US where historically property has been held in common, and restrictions placed on the use of privately-owned property [Cronon, 1983; Geisler, 1984; Sax, 1984].

History notwithstanding, firmly equipped with their beliefs about the proprieties of property, American foresters often find third world property systems confusing and probably aggravating as well. For the unwary forester there are at least four traps.

First, land may be held communally. The system for getting permission to utilise this land may involve consultation not with a single owner but with an entire community or its leaders using processes which may be lengthy and based on consensus.

Second, in systems of shifting cultivation, land in fallow (which generally appears abandoned and therefore unowned) is almost always owned by someone. Clearing this land for utilisation in a forestry project is likely to result, at the very least, in ill will.

Third, in many places the system of tree tenure is complicated. It is not uncommon for trees to be owned (and therefore leased, mortgaged, inherited and sold) separately from the land on which they grow. The rules governing the rights of tree ownership, tree use, and tree planting and the results of all these activities differ considerably from what seems common sense in western property law [Fortmann, 1985, Fortmann and Bruce, 1988]. Moreover, the rights of men and women may differ significantly. For example, among the Ibo, timber trees belonged to men while women controlled the use of food trees. Women could not inherit but had the right to be maintained from the proceeds of economic trees owned by their parents [Obi, 1963].

Finally where there is more than one social unit claiming the land (typically a national government and a local unit) *de jure* and *de facto* control over the land may be two different things. Foresters may run afoul of this either in the course of trying to manage a government plantation or in trying to carry out a government logging contract in an area used by subsistence farmers. Local people who do not recognise the legitimacy of rights conferred by an outside government have both the reason and the ability to destroy projects which run counter to their perceived interests.

Foresters, thus, suffer from their biological bias in two ways. First, in identifying a solution to the very real problem, the lack of trees, they will almost inevitably propose a simple biological solution—plant trees—when the real solution may be a political one such as land reform. Second, in implementing tree planting, foresters often miss nuances in local social relations and proceed in a way that guarantees that their project will fail or will have adverse social consequences including the exclusion of the poor and or women. [Foley and Barnard, 1984; Hammer, 1982; Mnzava, 1983; Shiva et al, 1984].

IV

Conclusions

Historical events in America led to the evolution of a forestry professionalism which is often unsuited to forestry for development. Male and female, American and third world foresters are all affected by their training in the tenets of American forestry professionalism. But while American forestry professionalism can be a liability in forestry for development, its integrity a[nd] its intensity can both be strengths. Thus, [we] are arguing that specific efforts must [be] made to understand and re-evaluate profe[s]sionalism in American forestry if forest[ry] development efforts are to be successful.

Notes

1 Although we will not try to prove that th[ey] have similar problems, other Nor[th] American and European foresters clear[ly] have similar traditions. In fact, renewab[le] resource management in the United Stat[es] was imported almost full-blown fro[m] France and Germany; first by immigran[ts] such as Carl Schenk and Bernhard Ferno[w] and later by Americans trained in Europ[e], the most widely publicised of whom is Gi[f]ford Pinchot. For the "classic" discussio[n] of the European forestry tradition in th[e] Americas, see Gould, (1964), Dana an[d] Fairfax (1980) and the references cite[d] therein.

2 Which until the early 1930s employed vi[r]tually all of the professionally traine[d] foresters in the United States. See Clepp[er] (1971) for a full discussion of the rise of "in[dustrial]" and "consulting" foresters durin[g] the early 1930s.

3 Which was a particularly traumatic decad[e] for foresters—see generally Dana and Fai[r]fax (1980).

4 Given the present debate over "privatisa[tion]" or, less drastically, greater reliance o[n] market or market-like incentives in publi[c] land management, it is difficult to believ[e] that this initial embrace of federal lan[d] ownership was so unheralded. Despite cur[rent] economists' efforts to present thi[s] apparent break from reliance on privat[e] ownership as a radical departure from th[e] standard pattern in this country, (see article[s] by Nelson, 1980; Gardner and Dowdel i[n] Brubaker, 1984) it was not generally discuss[ed] as such at the time. (See Fairfax an[d] Tarlock, 1970).

5 This familiar casting of the issues in term[s] of east vs west, reflects the messianism o[f] the Pinchot days: it is almost inevitabl[y] recast in terms of good guys (the conserva[tionists]) vs bad guys (in the extractive in[dustries], principally loggers at the time). I[t] is also one of the hardiest and most deceiv[ing] myths of the early conservation move[ment]. Pre-progressive era advocacy fo[r] forest reservations was in fact dominated by western water users in the mistaken belie[f] that forests "caused" water. It was not unti[l] Pinchot came to power that forest produc[tivity] became the watchword of forest reser[vations] (which were then renamed Nationa[l] Forests). For a fuller discussion of the cross[-]cutting stimuli behind pre-progressive era forest reservations see Hays, especially chapter 2 and Fairfax and Tarlock, 1970[:] note 106 p 534).

6 On the shift in attitudes toward regulation of land use and its relevance to public land management and retention, see Sax in Brubaker (1984).

7 Ironically, this definition includes other than trees because Pinchot was forced to strike political compromises with other

forest users in order to gain control of the forest reserves and have them transferred from the General Land Office in the Department of the Interior to his domain in the Department of Agriculture.

8 This attitude is by no means restricted to male foresters. For example, in the session on Women and Forestry at the 1978 World Congress on Forestry in Jakarta, the papers, mostly written by women, concentrated on women's participation in forestry only in their capacity as a professionally trained forester (e g, Fairfax and Witte, 1978).

9 In Bangladesh 90 per cent of all woodfuel and timber comes not from Forest Department forests but from trees grown on homesteads (Byron, n d).

10 For example, on a trip by one of the authors to study *social* forestry projects, her forester guides were astonished when she asked to speak with the *people* involved rather than simply look at hectare after hectare of the trees which had been planted.

Theory and Practice of Estimating Domestic Resource Cost in India

Kalyan Raipuria

This paper discusses the specific deficiencies of the present DRC estimation practices in India and what can be done to improve upon them keeping in view the theoretical backdrop and recent developments. In doing so, certain estimation problems faced by the researchers are raised. It is maintained that alternatives exist to tackle the problems of estimation which should be adapted in analyses of DRC-based comparative advantage of Indian industry.

I
Introduction

THE increased use of domestic resource cost (DRC) measure in analysis of economic policy changes in India should be welcome insofar as it is aimed at efficient resource allocation, production and policy system.

The initial attempt made in Israel and discussed by Bruno [1967 and 1972] to use DRC measure, with some developments in recent years, was in connection with efficient planning of the external sector and evaluation of projects involving substantial foreign exchange in the face of 'imperfections' of factors and commodity markets and more importantly of foreign exchange market. The Indian economy characterised by these imperfections apparently presents a good case to apply the DRC measure.

With increasing complexity of issues of industrial policy [Alagh, 1988] and several policy changes recently initiated by government,[1] DRC measure has come rather handy for analysis of issues in hand which is indeed superior to the criterion of net foreign exchange earnings. This is clear from the reports of the three recent official committees which had gone into (i) the issues of trade policy [MC, 1984], (ii) the principles of a shift from physical to financial controls [MF, 1985 A and B] and (iii) rationalisation of tariffs on capital goods [BICP, 1985], as also from the policy framework for the Seventh Five-Year Plan, 1985-90 [PC, 1985]. The first, known as Abid Hussain Committee [MC, 1984], has observed that "the prices of domestically produced importable inputs have remained higher than corresponding world prices because domestic resource costs have not been an important criterion in the formulation of import policy" (p 5). The second, known as Narasimham Committee [MF, 1985 A], has gone a step ahead and has recommended that "import substitution activities, where net foreign exchange savings are small but domestic resources costs are high, should not be encouraged" (p 6). The theory and practice of estimation of DRCs were, however, left by the committees to be handled by the concerned authorities on policy procedures.[2]

In the above context, it is necessary to examine the exact practice followed in DRC estimates in recent studies. The practice may be counter-productive if the measure is misapplied leading to undesirable/inoptimal policy changes in a low-income developing country like India. In the seventies, certain studies estimating DRCs in the Indian context showed their usage as well as the limitations for *ex post* evaluation [Bhagwati and Desai, 1970; Panchamukhi, 1970; Staelin, 1971, 1973 and 1974; Bhagwati and Srinivasan, 1975; Nambiar, 1973 and 1978]. Notable was the advancement made in tariff plus non-tariff based prices, by Panchamukhi, in analysing DRCs for Indian industries under QR regime [Ch 17 of Bhagwati and Desai, 1970 and Panchamukhi, 1978]. An extensive use of DRCs across sectors in analysis of import substitution strategies based on QR regime in NBER strategies [Bhagwati-Krueger, 1978], however, attracted serious criticism by the Indian planners and cost-benefit analysts that quite apart from measurement problems, misallocation inference from varied DRCs "ignore the complexities of general equilibrium analysis and possible non-linearities in the valuation of inputs and outputs" [Desai, 1978]. Further limitations and analytical possibilities for analysis of trade policy were indicated later by some viewers [Kelkar, 1980; Ali, 1980; Kelkar and Raipuria, 1980; Ray, 1983; and Chandra, 1986]. The present paper, focusing on the recent DRC applications in India, aims to discuss their major deficiencies and analytical possibilities in some detail keeping in view the complexity of the given macro-level and industrial planning and policy formulation process.

The factor, commodity and foreign exchange market imperfections which led Bruno and others to evolve the DRC measure are not only applicable to a developing country like India, some of them also exist in so-called market economies. What is emphasised in this paper is that the specific nature of these imperfections in a developing country should be kept in view in applying the DRC measure entailing analysis further to Bruno. It is contended that a simplistic application and analysis of DRC which may bring discredit to the theory itself must be avoided, and that an extended analysis is imperative to account for the given context and the basic and structural characteristics of the economy under review.

The plan is to discuss first the theoretical backdrop and recent developments (Section II), followed by the recent practice of DRC applications in India (Section III) and a suggestive concluding section on what can really be done in the Indian context (Section IV).

II
Theory: Recent Developments

The theoretical backdrop of DRC measure has been discussed at length in a Symposium, contributed among others, by Balassa, Bruno, Krueger and Schydlowsky [JPE, 1972], aside from in the original contribution by Bruno [1967] and Balassa-Schydlowsky [1968 and 1972]. The empirical research which followed also contributed to certain aspects of DRC theory. Important theoretical contributions of the extended nature of DRC measure include those by Bhagwati and Srinivasan [1973 and 1979], Pearson[1976], Srinivasan and Bhagwati [1978], Schydlowsky [1984] and Warr [1982 and 1983]. The present discussion does not aim to review these contributions. However, it is necessary to recapitulate the important points coming out of them which are directly relevant to applying the DRC in practice for policy analysis.

The basis of Bruno's original contribution on DRC, estimated as cost-benefit criterion based on accounting prices, was the need to express country's comparative advantage, i e, relative 'efficiency' *vis-a-vis* the rest of the world for a developing country, given (i) the basic analytical problems arising due to (a) division of macro-micro policy decision-making in regard to investment in government; and (b) the bias arising due to use of market prices of primary factors of production: labour and capital, utilities, and foreign exchange; and (ii) analytical necessities are emerging due to interdependence in an economy though a sectoral investment decision is being undertaken. The latter meant "direct and indirect effects on other sectors, both in terms of derived input demand from other industries or primary factors of production, and in terms of increased supply of the new commodity or service produced" [Bruno, 1967]. This is in view of the need to take dynamic and comprehensive view of 'efficiency' in the context of national planning especially external sector planning.

Recent Developments

Some of the later contributions, however, ed to the impression that it is futile to aim t tackling the basic analytical aspects due nainly to the critical problems of estimating ndirect inputs, imputed capital costs (and heir import content), accounting prices and ndustrial structural rations. The lgebraic/numerical similarity between DRC and ERP measures was another reason. The additional reason was controversy about reatment of non-traded inputs being exclud-ed/included in value added (*a la* Balassa and Corden respectively). It was found, for example, that DRC estimates do not have "a greater claim of legitimacy" with use of shadow prices [Bhagwati and Srinivasan, 1976] and alternative measures of DRC were derived in the presence of the empirical problems of accounting prices which almost negated the very use of them. Thus, what we find today is the measure being applied in analysis of trade and tariff policy changes by way of estimating simple ratio of domestic and international value added, frequently for only one point-of-time, mostly at market prices. The use of appropriate shadow prices were still recommended for "sensitivity analysis" and especially if we wished to get our DRC estimates closer to the "time cost-benefit oriented measure" [Bhagwati and Srinivasan, 1975]. Whether such approach is "welfare improving" or not is in fact a matter of discussion on implementation of shadow prices in reality. Indeed, systematic computation of appropriate shadow prices remains a major analytical and quantitative enterprise in itself. But economists' enterprising talents have not been lacking, in theory and in practice.

Problem of Cut-off-Point

It was recognised in the original writings on DRC that the DRC as criterion can be used to distinguish between activities/projects with positive/negative/nil net social benefit defined as DRC shadow exchange rate (SER), DRC > SER, and DRC = SER respectively, assuming that SER can be systematically estimated and that SER takes the activity to break-even. In a number of studies, the activities were ranked according to DRC and activities with high DRC were criticised to have been promoted by government leading to resource misallocation *ex post* [Bhagwati and Desai, 1970; Bhagwati and Srinivasan, 1975; Panchamukhi, 1978; Staelin, 1974; ICICI, 1984; and Nambiar, 1977 and 1983]. Such studies show that DRC analysis can be done even without SER.

Whether the determination of acceptability of an activity/project requires SER or not is a question dealt with recently by Warr [1983]. According to him the problem is that when *ex ante* more than one of a class of a mutually exclusive projects meets the cut-off-point criterion, a choice must be made among them. In IRR (internal rate of return) and in BCR (benefit-cost ratio) also cost and benefits are computed and projects are ranked by this. But, it may not give the same ranking as given by NSP (net social profitability) itself. Thus, Warr observes, "all three criteria, IRR, BCR and DRC are capable of distinguishing desirable projects (NSP > 0) from undesirable ones (NSP < 0); *but none of them can be relied upon to rank a set of mutually exclusive projects correctly*" (emphasis added). This he shows by considering the linear relationship between NSP and SER with positive slope, i e, DRC denominator—the project's production and use of tradeables at 'border' prices and foreign exchange numeraire but converted in domestic currency numeraire using SER; and negative intercept, i e, DRC numerator—the project's cost of the non-traded inputs, 'labour' and 'capital', evaluated at 'second-best' shadow prices in domestic currency numeraire. In a situation of expanded number of activities/projects, SER estimate is indeed required. According to Warr, SER must be used to rank the projects, not simply to provide the appropriate cut-off-point. Thus, Warr feels that the empirical advantage of using the DRC without SER estimate is lost. What Pearson [1976] argued is that DRC has a major advantage over NSP as DRC does not depend on the choice of SER and that SER has to be used to provide a cut-off-point when the DRC of the least socially profitable project *ex ante* is just less than the exchange rate.

We feel, accepting the use of shadow prices, including SER, the DRC criterion remains preferable due to superiority of its analytical framework for a country's 'comparative advantage' among different activities and for helping the policy-maker to study 'make or buy' choices relevant to the industrial activities whose inputs and outputs can be evaluated at appropriate world prices and which entail significant foreign exchange.

Extended Applications

While the primary area of application of DRC estimates has been trade and tariff policy, recently this measure has been applied in many other related areas. In doing so, the authors have adopted and extended the methodology. One of these uses is in evaluating education programmes for purposes of indigenisation [Monson and Pursell, 1979]. Such programmes are likened to import-substitution in a developing country where local labour is expected to replace previously imported skilled foreign labour. In applying to the problem of expatriate labour replacement in the case of Ivory Coast, the researchers have duly considered the original tenets of the Bruno method, i e, evaluation at shadow prices and analysis in terms of "accept/reject the ith project". These researchers present the analysis in an attractive fashion insofar as the analysis is akin to social cost-benefit appraisal of social services, which is rather a complex area for quantitative analysis.

Yet another area in which the DRC has been applied recently is the *ex ante* analysis of projects aiming exclusively at exports [TDA, 1975]. Since every project consists of a stream of benefits and a stream of cost over its chosen time, commercial profitability has been analysed in the framework of benefit-cost analysis. Since the main benefit of such projects is foreign exchange the expected foreign exchange output from the project is compared with the cost of inputs, and labour and capital imported from the mainland in the project zone or island. The DRC, then, is estimated on the basis of capital cost, capital recovery period, and the applicable, interest rate. The benefit, i e, foreign exchange output inlcuding earnings from utilities and *entrepot* trade are added and compared with the import and other costs, and net benefits estimated in the DRC format. Such analysis, of course, has certain problems insofar as it is put in the CBA format.

The third kind of new application of DRC is in terms of CBA, attempted by several researchers in the context of project appraisals and the same shortcomings follow. In addition, some of the benefits being of black-box nature, crucial assumptions are made regarding flow of benefits which can only be subjective in many cases.

These new applications, however, do indicate the increased usefulness of the DRC measure. But, since the measure is being applied in heterogeneous areas, with/without the necessary discussion of the macro-micro context and adjustments, one has to be very cautious in applying these in the Indian context.

III

Estimation Practice in India: Recent Studies

A review of the DRC estimates, made on *ex post* basis, by the international and national organisations/individuals, in the eighties, leads us to believe that this measure has become a short-cut method to derive conclusions on changes in industrial and trade policy as also on tariff calibrations for future in regard to the select industries taken up for some *ad hoc* study.

There is a clear shift in approach from DRC ranking across-the-sectors [*a la* Bhagwati and Desai, 1970; Staelin, 1971, 1973 and 1974; Panchamukhi, 1978; ICICI, 1977; Bhagwati and Srinivasan, 1975; Nambiar, 1977 and 1983 and NCAER, 1983], to the estimation of DRC for an industry earlier done by Krueger [1970] for automobiles in the context of import-substitution analysis of an industry. While the former were beset with certain shortcomings primarily arising out of problems of estimating domestic and international prices on a uniform basis and the availability of relevant contemporary input-output table to account for direct and indirect inputs; the latter abounds with some additional shortcom-

ings, theoretical as well as empirical, turning them misleading. They are discussed in brief, in the para that follows.

The recent DRC estimates according to an industry are of three types: firstly, those which primarily consider the ratio of domestic and international value added in an industry in estimating DRC and ERP (=1−DRC), with minimal value/price adjustments [applied in capital goods in World Bank, 1984; BICP, 1988; BICP studies quoted in Alagh, 1989; etc], secondly, those using the ratio method in regard to an industry analysing also the components of value added and production unit-wise comparisons of DRC [CEI, 1985]; and thirdly, those which discuss DRCs on the basis of ratio method covering the comparable products of an industry [Ray, 1983].

MAJOR DEFICIENCIES

Some of these studies [World Bank, 1984] show the awareness of the need to consider the shadow/accounting prices and provide the sensitivity results in their regard but remain partial and static in analytical sense.

What is common in the recent studies, in general, is their focus on one point of time (and thus on purely static analysis) and an industry or selected sub-sector level estimates of domestic/international value added ratios as DRC measure and ignoring details of the relevant general equilibrium and macro-context of the economy; consideration of the traded and non-traded/non-tradeable inputs as part of value added with appropriate pricing; accounting as far as possible of the indirect (second, third and further rounds), domestic and imported inputs using input-output analysis, least of dynamic input-output analysis; and adjustments in respect of shadow prices, exchange rate and risk changes effecting the expected profitability aside from DRCs; and the varying rate of inflation. These studies do not recognise the structural factors lowering value added in relation to cost of capital, e g, under-utilisation due to sunk capacity, and demand shortages and other factors beyond the control of entrepreneurs, the cost-raising factors like excess inventories which arise due to shortage of raw materials and components, and the production bottlenecks such as interrupted power supply which are also beyond the control of the producer. Furthermore, such studies ignore analysis of the structural characteristics of the industry such as capital-output ratio, capital-labour ratio, capital/labour-value added ratio, non-tradable inputs-value added ratio, etc, faced with serious technological alternatives in the present industrialisation [Alagh, 1988]. We have found that analysis of 'backward', 'forward' and other linkages along with factor-intensity, ratio of wages/value added and employment identified in the linked industries indicate the growth effects of an activity in the macro context which throws further light on its acceptability to the planners. The sensitivity analysis in respect of the estimated current price elasticity of demand and supply in detail is also not attempted. They do not make any distinction between general Convertible Currency Area (GCA) and Rupee Payment Area (RPA) attracting different 'true' values of exchange rate at different times. The different considerations arising in respect of short run and long run loss on account of credit, domestic and foreign capital cost of non-traded inputs and fixed wage cost in short run DRC estimates are also ignored.

Discussion on some of these considerations was earlier provided in Paul and Mote [1970], Paul [1971], Bhatt [1972], ICICI [1978], Ali [1980], Kelkar and Raipuria [1980], Ray [1983], and Chandra [1986]. How most of these considerations can be included, the desirable adjustments made and analysis advanced in regard to DRC estimates in an integrated manner, was demonstrated by Raipuria [1977] taking an industry case in some detail which could be extended across industries. In what follows, we discuss the major ones of these in brief.

MACRO CONTEXT OF DRCs

Let us take firstly the present macro context in which we are concerned with efficient import substitution and export promotion and which is part of the Seventh Plan policy framework. The Plan recognises that due to quantitative restrictions, "a large number of import products are replaced at a much higher domestic resource cost (DRC) than would have been involved in acquiring equivalent foreign exchange through exports" [PC, 1985, para 6.43]. The Plan proposes to promote trade, minimising bias against exports and maximising only efficient import-substitution. Obviously, this presumes a DRC analysis across the sectors to identify products where licensing should be reviewed and duties/incentives should be rationalised.

But, as the Plan recognises, this is subject to the extent demand structure (and also supplies) can be influenced. It further states that "balance of payments difficulties stemming from the structure of demands cannot be overcome simply by correcting the existing policy bias against exports; for that would only shift resources from import substitution to exports whenever the latter are more competitive internationally. Thus, in addition other measures will be needed which are designed to restrain generally the growth of domestic requirements of import substitutes and exportables (other than wage goods/essentials like foodstuffs) as well as to strengthen the production base for both" [PC, 1985, para 6.4].

Thus, the demand/supply schedules (say, by way of material balances) projected for the Plan period become highly relevant in analysis which are based on certain parameters notably demand elasticity with respect to income and price, both in turn affecting DRCs. Furthermore, the above macro context also means that given high DRCs of a number of sectors, further analysis of the dynamics is necessary in a developing country like India as what is today high DRC and incompetitive activity may turn out to be competitive tomorrow and that closure of these activities simultaneously is out of question economically (keeping in view the foreign exchange constraint, in an 'open loop' macro framework) and politically (especially in view of employment implications) as it would mean a kind of 'corner solution'[3] on the standard transformation curve given by the production function of two resources say, labour and capital for production of two final goods. There are also important considerations of employment, technology, energy-saving, acceptable long-run resource depletion, etc, emerging from the macro context which should be kept in view in DRC analysis. Given a large share of wage goods and essentials in total production where the necessary reform measures guided by DRC, are difficult to take, the area left for DRC-based policy measures is, in fact, very limited to exercise the make/buy choice.

ANALYSIS OF INPUTS AND OUTPUTS

The direct and indirect inputs need careful analysis through industry-level studies as well as input-output table. Since different inputs continue to face different demand/supply situations, market patterns and pricing policy regimes [Alagh, 1987 for the latter] in India, they need to be taken into account in adapting prices. Mostly, non-traded/non-tradable inputs are supplied under state aegis or are under one or the other kind of government control which means that the area of difference between administered and 'true' prices need to be identified. DRCs indeed show significant sensitivity to treatment of non-traded inputs.

Input-output analysis shows industries of three types: In certain industries, the process line is pretty long and direct inputs apparently constitute major proportion of value of total supplies of inputs, but indirect inputs are crucial to whole cost-price structure (e g, man-made fibres/fabrics). In second type of industries, the process line is short and there are few significant direct inputs but there is a series of indirect inputs which in fact constitute the major share of input value (e g, POL, sugar, cement). In the third type of industries, given long/short process line, non-traded inputs and one or two raw materials constitute major share of input value, and indirect inputs are little (e g, aluminium) [see CSO, 1981, Annexure 7]. These differences need to be highlighted in the cost-price adaptation. In all these industries, the share of imported inputs also need careful analysis covering capital inputs.

In imputing the cost of inputs, it is also important to look into the 'outliers', while dealing with a short period of analysis, which may arise due to transient policies and/or market conditions.

It is crucial to gauge the dynamics of

technology if it may change the prices and intra-industry product-mix in some 'discontinuous' fashion to disrupt the DRC estimates.

It is also important to adapt/estimate the domestic and world prices carefully and examine the relationship between changes in prices and those in import and tariff policy, exploring the nature of not only the home market but also the character of the foreign market.[4] It is our experience that discussion with the concerned authorities (like DGTD, BICP, CCI & E, CBEC and public sector corporations) which are equipped with technical and experienced personnel may be found rewarding in addition to select use of now available array of publications on manufactures' production and prices.

ADJUSTMENT FOR 'REAL'/'TRUE' PRICES

Adjustment for 'real'/'true' or shadow accounting prices of factors, inputs and foreign exchange is one of the basic tenets of the DRC and is associated with the origin of the concept. The shadow prices are being increasingly employed in programme evaluation as well as project appraisal in the context of the developing countries, despite conceptual and estimation hazards. While it must be conceded that firm and widely acceptable estimates of such prices are rarely available, certain location-bound and programme-based prices or those based on partial equilibrium analysis of the economy have been in use for long in the recent literature on benefit-cost analysis. In adjustment for shadow prices, the consideration is not of welfare increasing/decreasing of the citizens at large or a target group, nor it is academic sophistication as has been argued [Bhagwati and Srinivasan, 1975, and Bhagwati, 1975]. The primary objective is to bring out the elements of imperfections in the factor, commodity and foreign exchange markets characterising a developing country particularly of the type of Indian economy.

The approach to adjust prices for these imperfections is in line with the basic growth theory which discusses the scarcity of capital, sub-optimality of savings rate and unlimited supplies of labour, high premium of foreign exchange notwithstanding. The DRC estimates which ignore the shadow prices lose the basic tenets of the DRC methodology. Bruno [1967], originally formulating the DRC criterion for optimising import substitution/export promotion activities, was inspired to use shadow prices, knowing fully well the limitations of the estimation, by way of analysing a whole series of projects "with given shadow/accounting prices and then review the latter intuitively on the basis of the overall analysis of factor demand and supply".

In the recent major cost-benefit analyses, indeed shadow/accounting prices (economy-wide and sectoral) have been used with advantage in arriving at reliable social value of the projects/ activities [e g, in a number of the World Bank studies, Little and Scott, 1977] and have been found meaningful for policy analysis. The different ways of implementing accounting prices have also been discussed in some detail [Little and Scott, 1977]. Recognising the estimation hazards especially of information (and not so much in view of the conceptual problems), Tinbergen has suggested the trial-and-error method of estimation of shadow prices [Tinbergen, 1955]. Compared to (initial) market prices, these 'second-best' optimum prices, reached by iteration until equilibrium is reached, following the rule of marginal social cost (payment to foreigners if imported or change in consumption).

Alternatively, use may be made of estimated constant adjustment factor to market prices entailing much less informational problems. This would, of course, be of lesser value than 'second-best' optimum. 'First-best' optimum prices are expected to be obtained on the basis of non-linear programming models. But, the 'objective function' and constraints need to be carefully looked into in the light of the present economic problems. Little and Mirrless' advice for foreign exchange equivalent shadow prices has been popular recently. They may or may not approximate to the optimal shadow prices as much depends on empirical analysis attempted in respect of exchange rates and border/world prices which cannot be taken on their face value.

The available estimates of shadow prices in developing countries show consistent estimates [see for a note on India, Raipuria, 1977, being updated for recent research] lower in regard to labour, and higher in regard to capital and foreign exchange, shadow prices of capital being much higher than the market rate of interest, the shadow rate of labour being sufficiently lower than the market average wage payment to labour and there being significant premium of foreign exchange (considering convertible or hard currencies) all supporting the need for shadow prices. However, the choice criterion for selection of particular set of prices should be the consistency of their analytical framework with the macro/planning framework of the country. Underestimation of capital cost and overestimation of labour-cost, on the basis of market rates, are not likely to cancel each other due to different shares of the factors in value added and differentials in capital/labour ratios among different activities clear from empirical studies in the past [Staelin, 1972]. By now, in India, the use of consistent adjustment factor in place of the exact shadow prices appears to have come to stay in BCA and in DRC/ERP studies in terms of sensitivity analysis [e g, CEI, 1985 and Pursell, 1987], and study with/without premium/discount [Narain, 1987].

USE OF WORLD/BORDER PRICES

Why prevailing world market prices cannot be taken on their face value? The well known reasons include serious imperfections in the world market structure, tendency for dumping in certain products by producers of the developed countries, possibilities of transfer pricing by TNCs; and increasing trend in favour of counter deals hiding the relative price position over time; reflecting more of the bargaining power of the barter dealers, world prices representing a preference function of the industrialised countries notwithstanding. The imperfec-

tions relate not only to statistics even if they are weighted, but also to supply structure, to the availability of number of buyers, quality and technology differences, information about demand/supply and prices, and above all to payment clearing as many of the supplies are tied to credit/aid. In very few cases such as primary commodities one finds the information about really competitive world prices. There remains the problem of wide fluctuations, partly due to imperfections, and partly due to business cycles. Forecasting of world prices, compared to home prices, therefore, is a more hazardous task. The problems of search for 'true' prices, therefore, are only compounded when use is made of the world prices.

Terms of Trade and DRC in DCs

With the observed significantly higher growth of manufacturers of the developed countries *vis-a-vis* of developing countries, over long run, international value added of major manufacturers are likely to be on the higher side compared to the value added manufacturers in the developing countries. One can question, therefore, the estimation of DRC and ERPs based on mere value added comparisons based on world prices, without the adjustments implied in DRC analysis of comparative advantage. The unadjusted value added comparisons are likely to suppress the comparative advantage of the DCs in certain activities (especially in import substituting) emerging from their natural endowments, low-cost hard working labour, insignificant R and D and low foreign expenditure due to borrowed technology. Thus, the observed terms of world prices and present international trade of the DCs should not be allowed to lead to over-estimation of DRC and suppress their inherent comparative advantage in certain manufactures. The comparative advantage as is frequently indicated by the ratio of world value added and DCs' domestic value added is indeed highly misleading defeating the very purpose of external sector planning.

Price Elasticity, MR and DRC

Considering that manufacturers by nature of demand and supply are likely to be price elastic, analysis of elasticities in DRCs based on particular prices (i e, average revenue, AR) is highly useful in order to cross check the assumption of infinite elasticity. If the price elasticity (η_p) is in fact not finite, we are faced with a differential between average and marginal revenue (MR). Bruno suggested [1969] that in such a situation we should consider MR ($=AR.1-\frac{1}{\eta_p}$) rather than R. According to Bruno,

> In principle one should allow for a margin of error. The best procedure, most probably, is to analyse the project under alternative assumptions as to future world prices and work out the sensitivity of the results to changes in these assumptions. If, for example, the commodity in question has a very high total import content a relatively small fluctuation in the price of the export of import goods may upset one's conclusions completely.

The same issues arise in estimating costs. The elasticity of foreign supply of importable inputs may not be infinite. This is especially relevant, as Bruno observes, when importable inputs constitute a significant proportion of costs and "when these are highly sensitive to the assumption about the price or unit input of some major factor of production."

It is also noteworthy that shifts in demand schedules are not independent of shifts in supply schedules, and the supply of exports depends, *inversely* upon factors affecting the internal demand for the product, and *directly* upon factors affecting the total supply schedules for the type of product exported by the producers. Therefore, supply elasticity is also worth considering in reaching any policy conclusion based on the DRC estimates.

The elasticity consideration is also relevant to the estimates of foreign exchange benefits and to the comparison of DRC and SER, for if the elasticity of demand for the country's foreign exchange with respect to growth of the economy is not infinite, we should consider marginal SER.

It is found that[5] DRC declines with high price elasticity and becomes negative with low price elasticity (meaning that activity is not socially acceptable at any shadow exchange rate). DRC remains at the level of estimate when price elasticity is very high, i e, more than 3 or so.

Distinction between Currency Areas

Yet another issue is whether a distinction needs to be made between trade with the convertible currency area (CCA) and the inconvertible area, that is, the bilateral trade area (BTA) or the rupee payment area (RPA).[6] The BTA represents, in common parlance, the 'bloc' countries or the Centrally Planned Economies (CPEs). To the extent the export earnings facilitate necessary imports from both CCA and BTA, such a distinction is unnecessary. However, it is widely believed that the degree of freedom to operate at world prices, besides convertibility, is less in the case of the BTA than in the case of the CCA. Some more arguments can be advanced in favour of making a distinction.

The extensive trade of the CPEs with one another at the expense of trade with non-block nations is attributed by Holzman [1974] in part, to "the unwillingness of non-bloc nations to adapt themselves, without a charge, to large-scale trade with the CPEs, under the CPE ground rules". The fact that the imbalances among bloc nations are settled in convertible currencies or gold implies a premium on the CCA. It also amounts to paying a charge of discount on bloc currencies. "The actual statistical picture", according to Holzman [1974], "shows bloc exports to the west at lower prices and import from the west at higher prices than those prevailing in intra-block trade. This is believed (to be) the result largely of western discrimination against and controls over trade with the east".

Holzman [1974] gives many other strong reasons for making the distinction between CCA and BTA. He says, for example, that extra effort (or cost) is involved in trading with the CPEs. It is possible to enter into trade with countries of the western customs union by surmounting tariff barriers, but it is very difficult to break into the planned intra-bloc trade regardless of cost advantage or need. Moreover, state traders of the CPEs have much more power for driving a hard bargain (subject to a given share in the world market and assorted elasticities) than even private monopolists. Further, since the CPEs are more interested in imports than in exports, the burden of achieving a well-balanced trade largely falls on the trading partner. Holzman [1974] observes that "this may involve accepting in payment goods of lower priority and higher price than are available elsewhere in the world market". Further, inconvertibility remains a constraint on multilateralisation of trade.

For the above reasons, it is only natural that bloc currencies should sell at a substantial discount relative to western currencies and gold. Likewise, the SER may work out to be lower in the case of the BTA than in the case of the CCA. The SER estimate should, therefore, be weighed according to the existing and projected shares of the CCA and the BTA in the total trade. Alternatively, export earnings may be valued by applying different SER in the case of the CCA and the BTA on the basis of their respective shares in exports.

Imports for Exports

In the projects for approval especially in the export-oriented projects, net foreign exchange earnings (NFEE) criterion is generally applied in India. Thus, we may have the following investment rules:

(1) The scale of the activity may, if feasible, be expanded so long as NFEE is non-zero, and
(2) The activities may be expanded, if feasible, to levels where they result in the same NFEE.

If Rule 2 is satisfied, the planners seek to maximise the net foreign exchange earnings from the investment. Resource allocation is 'optimal' in terms of NFE, defined as exports, direct and indirect, minus imports direct and indirect. Indirect exports and imports are computed with the help of the input-output table of the country.

The criterion of DRC is indeed superior to that of NFEE or dollar 'value added' criterion[7] prescribed in import policy, particularly in case of a project which is primarily export-oriented and which involves

large imports (e g, in 100 per cent export-oriented units, selection of which presumes the country's comparative advantage). DRC facilitates consideration of the social cost of the net foreign exchange earned from such a project.

IV

Conclusions: More Can Really Be Done

Considering the emphasis laid, by the recent high-level official committees on industrial and trade policies, on DRC analysis for comparative advantage of Indian industries in India, the present paper has brought out the need for more careful estimation of DRCs. It is found that the practice followed in the recent empirical work done by the international and national organisations/individuals leaves much to be desired in terms of following the appropriate theoretical basis, necessary adjustments and extensions, and drawing conclusions in respect of comparative advantage of the selected industries. It is maintained that, in view of the basic tenets of the DRC framework propounded by Bruno et al, and clarified in the follow-up discussions, careful use need to be made of the parameteric estimates (like price elasticities) required in making necessary adjustments in input and output prices and factor evaluation. It is felt that more can really be done to strengthen the DRC analysis in order to draw really meaningful policy conclusions. They include necessary adjustments in respect of 'true' prices of factors of production and foreign exchange, adaptation of appropriate border and domestic prices, exchange rate and risk, and inflation; sensitivity analysis for price elasticity; complimentary analysis of industrial structural ratios; and projections into potential DRCs taking into account the unfavourable terms of trade of DCs and 'learning by doing' effect is important in development process, all in the macro context of the industry under consideration. The macro context is extremely important to take into account insofar as the choice in industrial development may not only be 'make or buy', but also 'buy, learn and make' and/or 'buy, make and back-sale'.

We believe that the present band of practising economists, econometricians, programmers and modellers in India,[8] information technology, and research financing, if motivated and given due priority, would not find it difficult to develop a database and analytical framework for readily usable and 'rolling' estimates of parameters (viz, price elasticity) and updated input-output and import coefficients, we mentioned in the present paper for what more can be done in regard to DRC analysis, so crucial for planning and policy formulation.

How a specified database is important is corroborated by the need to have DRC estimates on the basis of a reasonable number of observations. It is highly risky to draw any firm policy conclusions on the basis of one or two observations.

Indeed, the DRC criterion is found to be superior to the criterion of net foreign exchange earnings applied in evaluation of industrial and trade activities which has been the mainstay of sectoral and project appraisal as part of Indian planning and policies. However, this superiority of DRC criterion is achieved only if necessary care is taken in adopting the analytical framework.

Given the manifold objectives of Indian planning, DRC analysis can only be a guide to industrial development, and thus should be found useful to locate the industries/projects which fall in the segment of reasonably low DRC area which compared with the 'true' value of foreign exchange continues to be one of the biggest constraints of growth viewed in a open-loop system of multi-sectoral framework. Once an appropriate DRC framework is followed, for optimal industrial development, it is also essential that a symbiotic link for harmonisation is developed among the planning and policy procedures, covering industrial licensing, trade, tariff and financial policies.

TABLE A

η*	Multiple $1-\frac{1}{\eta}$	MR = P $(1-\frac{1}{\eta})$ (P = Rs 1.4)	DRC $1-\frac{1}{\eta}$ (DRC Rs 6.8)
0.25	−3.00	−4.20	**
0.50	−1.00	−1.40	**
0.75	−0.33	0.46	**
1.00	—	—	**
1.25	0.20	0.28	34.0
1.50	0.33	0.46	20.6
1.75	0.44	0.61	15.4
2.00	0.50	0.70	13.6
2.25	0.56	0.78	12.1
2.50	0.60	0.84	11.3
2.75	0.64	0.89	10.0
3.00	0.66	0.92	10.3
3.25	0.69	0.97	9.8
3.50	0.71	0.99	9.6
3.75	0.73	1.02	9.3
4.00	0.75	1.05	9.1
4.25	0.76	1.06	8.9
4.50	0.78	1.09	8.7
4.75	0.79	1.11	8.6
5.00	0.80	1.12	8.5

Note: Estimated P and DRC (average) of cotton textiles in India [Raipuria, 1977].
* The minus sign is ignored customarily.
** Negative DRC which implies that the activity is not socially profitable at any shadow exchange rate.

Notes

[This paper has been prepared in the author's personal capacity. The usual disclaimers follow.]

1 A review of these found in the various issues of annual *Economic Survey* of Ministry of Finance and in the *Annual Reports* of the Department of Industrial Development, Ministry of Industry, and Ministry of Commerce.

2 In fact, according to BICP, there is *no symbiotic use*, in the current procedure, of the concept of DRC in awarding licences. *The Economic Times*, July 19, 1988, p 1.

3 Chakravarty [1971] has illustrated how the concept of 'corner solution' can usefully be employed in analysis of India's political economy, given the plurality of environment pronounced after Second Five-Year Plan period.

4 It is shown by Nambiar and Mehta [1987, followed by interesting discussions in the same journal] that "there appears to be an asymmetrical link between tariff rate and the relative foreign prices; the latter has a tendency to be low when tariff is high and conversely tend to be high when tariff is low", and that substantial tariff reductions in the presence of imperfections in this world market are suspect; the foreign produce would rob some, if not all, the benefits of such tariff reductions.

5 How sensitive is marginal revenue (MR) and DRC to price elasticity is shown in Table A.

6 Kornai [1967] introduced two separate balance of payments constraints accounting for Hungary's trade with eastern and western capitalist blocs, on the basis of varying degrees of convertibility between currencies.

7 For example, as defined in the context of present import and export policy for export houses and trading houses [MC 1988 A, Para 212] and for 100 per cent export oriented unit scheme [MC 1988 B, Appendix XXIII-A].

8 Klein observed in this regard while delivering the Silver Jubilee Lecture at the Institute of Economic Growth [1984] that "there is nothing in India like the long-standing Mexican model project that has been used on a replicated basis for projections and policy analysis for India with frequent updating" while "The people are here in India. The hardware is becoming increasingly available, and Indian statistics are excellent."

Applicability of Monetary Approach to Balance of Payments

V S Raghavan
M K Saggar

THE view that money market disequilibrium plays a fundamental role in the determination of balance of payments (BP) has gained considerable importance in economic literature in the past three decades. In what has come to be known as the Monetary Approach to BP (MBOP), it has been propagated that BP is essentially a monetary phenomenon. Disequilibrium in BP is the direct consequence of mis-match between demand for money and supply of money. Furthermore, a major proposition of the MBOP is that a devaluation will be successful unless accompanied by an equiproportionate expansion in domestic credit.[1] The MBOP, developed by the economists associated with the 'Chicago Workshop' in the sixties and early seventies, soon became the cornerstone of the stabilisation programmes sponsored by the International Monetary Fund (IMF).[2] In fact, the Fund has been an ardent advocate of the approach in case of developing countries, notwithstanding its stagflationary potential and the questionable causality from domestic component of money to net foreign assets.

Recently, in a case study of India, [Kannan, R, 'Monetary Approach to Balance of Payments—A Case Study of India, 1968-85', *EPW* Vol XXIV, No 4, March 25, 1989, pp 627- 636] an attempt has been made to test whether disequilibrium in the domestic money market exerts any influence on the balance of payments. Applying the MBOP, the author estimates the reserve flow and sterilisation equations and uses Granger and Sims causality tests to show that the direction of causation runs from domestic credit to international reserves and not vice-versa. The author concludes on the lines that the state of equilibrium or disequilibrium in the Indian money market had a dominant influence on India's international reserves or, in other words, the MBOP seems relevant in the Indian case.

It is our considered view that the results of the study needs to be interpreted with considerable caution. The MBOP subsumes all monetary and non-monetary factors under 'money'. This oversimplifies BP analysis and limits its usefulness as a guide to policy-makers. More importantly, the characteristics of the Indian economy are inconsistent with the conditions which make MBOP relevant. Also, our own empirical results are at variance with those of Kannan and show that the theory of MBOP is not an appropriate model for explaining movements in net foreign assets in the Indian case.

Historical Perspective

The MBOP dates back to David Hume [1752] and the classical price-specie flow mechanism. Its contemporary revival can, however, be traced most notably to the works of Harry G Johnson [1958] and F H Hahn [1959]. Johnson relied on generalisation of the 'absorption approach' to show that BP-deficit is monetary in nature resulting from dishoarding of domestic money by residents or credit creation by monetary authorities. The deficit associated with dishoarding or the increasing velocity is self-correcting as cash balances are run down as a consequence of external deficit. The deficit then is sustained only through continuing credit creation. Hahn demonstrated the short-run impact of devaluation in a monetary general equilibrium on the lines of Don Patinkin's closed economy model of money, interest and prices.

The approach was further developed by significant contributions from R A Mundell [1968, 1971], McKinnon [1968], Frenkel [1971], Johnson [1972], Swoboda [1973], Dornbusch [1973] and Musa [1974].

Mundell introduced the money market equilibrium, the external equilibrium and the domestic real sector equilibrium in his model to show that BP problems persist because of failure of authorities to balance budgets. He also established a world monetary equilibrium in a two-country model that links inflation, interest rates, money stocks and credit creation to BP.

McKinnon's endogenisation of money supply showed the crucial role of public finance and capital mobility in BP. Frenkel developed a dynamic model, integrating real and monetary sectors to show that trade or capital account surpluses reflect excess supply of goods or securities, respectively, and a surplus in money account reflect an excess demand for money.

Johnson developed a monetary model to establish a direct link between devaluation and domestic credit creation through a scale factor but added that improvement in BP as a result of devaluation is transitory in nature. Swoboda expounded the view that the fiscal and monetary policies should be used in tandem to seek goal of internal and external balances and that monetary policy should be assigned to external balance.

Dornbusch developed a monetary ap proach to currency devaluation and showe that BP improves as a result of devaluatic through reduction in real value of mone unless the nominal quantity of mone increases equiproportionately in which cas the only effect will be an increase i domestic price level. Musa studied th monetary effects of tariff policy and foun that the belief that tariff improves BP wa fallacious.

The MBOP analysis is largely based o the Walrasian concept in which the exces demand of goods and services, bonds an securities and money, considered togethe equals zero. In an open economy, macro economic framework excess demand fo money causes an outflow of goods an services or sale of securities in the foreig market. This leads to reserve inflow till th BP deficit is eliminated. Similarly, exces supply of money leads to imports of good and services or a capital outflow. The BF is, therefore, self-correcting unless the dis equilibrium is sustained by a policy o sterilisation (continued domestic credi creation) followed by monetary authorities

Inapplicable Conditions

In case of a country like India, where tariff and non-tariff barriers (NTBs) distort free trade and where strict control is exercised on international capital movements by the government, it is difficult to accept that excess supply of money can be drained through imports and investments abroad till real cash balances become in line with desired stock of cash balances. So even if sterilisation does not take place, the enormous BP-deficit may not be cured in a MBOP fashion.

Furthermore, that typical MBOP models of the 1972 tradition assumes that key economic variables and the real income or its rate of change are exogenously determined by long-run full-employment assumption. In the small country case, prices and interest rates are assumed to be exogenously determined. Also, it is believed that changes in money supply brought about by movements in international reserves are not sterilised. So the proponents of MBOP say that monetary authorities have no control over the international component of the money supply and can thus control only the domestic component of it.

Such an analysis is far from the real world reality. 'Full-employment' condition can no longer be imposed on models for several OECD countries, not to speak of developing countries. Why a growing economy should be considered a non-growing one is difficult to understand. Perhaps it stands so to bring MBOP models in tune with the IMF philosophy in which money market equilibrium takes precedence over political and economic necessities of growth.

In addition, the monetary approach has overlooked the fact that in most less developed countries (LDCs), as well as in several developing countries, including the United States, sterilisation is being effected by running a government budget deficit corresponding to a BP-deficit. Sterilisation in much a manner becomes all the more important in case of a country like India, where the central bank has little say in targets for fiscal deficits and can control the credit creation by banks alone.[3]

The monetarist proposition that devaluation adds to aggregate demand and is inflationary is no longer accepted as a stylised fact. Theoretical and empirical evidence advanced by recent developments in economic literature show the likelihood of devaluation being deflationary or stagflationary.

Taylor and Krugman [1978] identified devaluation with contractionary effects because with an existing trade deficit, devaluation increases price of traded goods and so reduces real income at home and increases it abroad, leading to a fall in home country aggregate demand. Also, if trade is initially balanced, devaluation by redistributing income from private to government sector and from labour to entrepreneurs producing tradables (as a result of lagged increase in wages) will increase aggregate savings in the economy because of higher marginal propensity to save of the gainers. This will have a deflationary effect on the economy.

Bruno [1979, 1986] in his analysis of LDCs, specially semi-industrialised countries showed that devaluation could be deflationary in a situation where credit rationing occurs and where raw materials are being imported. The Basevi-de Grauwe's vicious circle hypothesis in the context of EFO-Aukrust Scandinavian model of inflation in small open economies show that currency depreciation leads to inflation via increase in wages and prices of intermediate inputs, necessitating further depreciation in turn.[4]

FUND-BANK APPROACH

The justification for IMF obsession with a standard policy prescription in the name of 'stabilisation' or 'adjustment' is then indeed open to question. Its standard package consists of: (i) A reform of trade policies judged by the yardstick of devaluation, removal of NTBs and lowering of import duty structure (ii) a ceiling on monetary expansion designed to trade-off inflation against growth, and (iii) A cut in government deficit, largely by decreasing subsidies and increasing administered prices.

The basis of the Fund's package is the underlying premise that money is the root cause of disequilibrium. It does not recognise that it is possible for inflation and BP deficit to exist when there is no excess supply of money. Both, the neoclassical economists and the structuralists have demonstrated the fallacious nature of this belief. Counter-examples have been

developed within the Walrasian framework to show that inflation and increase in money stock can take place independently. A curb on credit leads to substantial reduction in levels of employment and output by raising the capital costs. Devaluation results in a deflationary impact, more so in the cases large deficits co-exist with high tariff wall. Import liberalisation make the BP deficit even more unmanageable, at least over the short and medium run. Political economy constraints do not permit a cut in government deficit in the first case. Even if they do, the cuts can fuel a prolonged recessionary impact in the economy besides accentuating an already skewed distribution of income and wealth in most LDCs.

Apparently, there is a need for the IMF and the World Bank to re-orient its programmes by looking beyond regulating money supply in a bid to attain BP-equilibrium. Experience with monetarist packages for Chile and Argentina in the mid and late seventies or more lately in Tanzania and Zambia has shown that success with these programmes can at best be meteoric. Chile is often cited as a success story by the monetarists, but Chile's GDP growth rate turned negative after 1982, amply demonstrating that Fund programmes are costly in terms of growth. There is a need to dovetail Fund's BP adjustment programmes into the programmes of growth and structural adjustments being promoted by the bank.

Empirical Evidence

Having elucidated the theoretical inappropriateness of the MBOP and the fund adjustment programmes we now turn our attention to the empirical validity of the MBOP proposition. We had earlier stated that the results of the study by Kannan [1989] needs to be interpreted with considerable caution. We shall now show that the empirical work in the area of MBOP has failed to throw conclusive evidence either in favour or against the approach. In case of not so open developing economies, in particular, the applicability of the approach is all the more suspect. Furthermore, the methodology adopted in Kannan's paper needs to be looked at more carefully.

The paper uses the traditional approach of estimating the reserve flow and the sterilisation equation to study the causality between domestic credit and international reserves. However, the specification of these two equations is unique as more explanatory variables have been included than has been the convention. It is, however, not clear whether the explanatory power of the model has been enhanced in the process. The use of wholesale prices (WP) and a separate inflation rate (RAINFLA) seems somewhat unwarranted specially when it has not been possible to estimate the expected inflation rate as a distributed lag polynomial as hypothesised, with coefficient for rate of change of inflation at time t-1 turning out to be insignificant.

A more serious objection with the specification of the model is the possibility of identification problem. As the author writes in the paper, "If we adopt OLS estimation method, to estimate independently offset and sterilisation equations, a simultaneous bias is introduced in the equation in view of money supply identity [Kowri and Porter 1973, pp 453-54 and Magee, S, 1976, p 165]. Hence we have estimated these equations by two stage least square method..." [see Kannan, 1989, p 629]. It is not clear from the author's write-up whether he has estimated the demand for money equation simultaneously with the reserve flow and sterilisation equations.[5] In case he has not done so, then we are afraid both the reserve flow equation as well as the sterilisation equation seem to be under-identified, making 2SLS technique inapplicable to the system.

Also, the use of a host of explanatory variables with only 17 observations, results in a considerable loss of degrees of freedom in both these equations.

Table 1: Reserve Flow and Sterilisation Equations

1 Reserve flow equation:

$$(R/H)\ \ln R = \underset{(4.58)}{-6.55677^{*}} - \underset{(12.37)}{0.95351^{*}}\ \ln m_1 + \underset{(6.18)}{1.04259^{*}}\ \ln YPD + \underset{(8.78)}{0.67127^{*}}\ \ln WP - \underset{(112.46)}{0.85303^{*}}\ (D/H)\ \ln D.$$

$\bar{R}^2 = 0.998$ DW = 1.538

2 Sterilisation equation:

$$(D/H)\ \ln D = \underset{(3.01)}{5.56637^{*}} + \underset{(0.89)}{0.43008}\ \ln WP - \underset{(32.48)}{1.17747^{*}}\ (R/H)\ \ln R + \underset{(2.02)}{0.07948^{*}}T$$

$\bar{R}^2 = 0.981$ DW = 1.300

Notes: Figures in brackets denote t values and * denotes variable is significant at 5 per cent level.

Where, R = Net Foreign Exchange Assets of RBI;
H = Reserve Money; D = Domestic Component of Reserve Money (D = H – R);
WP = Wholesale Price Index; m_1 = Money Multiplier of Narrow Money (M1);
YPD = Real income (GDP at factor cost, at constant prices);
T = Time trend.

Among the other studies undertaken to test validity of MBOP to Indian case, the study by Sundararajan [1986] has been mentioned in the paper. The study which pertains to the period 1952-77 does not say anything about the causation between domestic credit and foreign exchange reserves. In addition, two more studies deserve mention, viz, S I. Bhatia [1980] and M Sohrab Uddin [1985]. Bhatia finds that for India's BP during 1951-73, it is not possible to reject the hypothesis of a significant log linear relationship between the explanatory variables and the dependent variable of the reserve flow equation, indicating support for the MBOP validity. The study, however, does not include a sterilsation equation and, therefore, ignores the possibility of sterilisation.

Sohrab Uddin's study covers the sample of three LDCs—India, Pakistan and Thailand. His results show that the reserve flow equation fails to adequately explain the movements in international reserves in the Indian case as the $\bar{R}^2$ is as low as 0.15. The offset coefficient is significant but does not have the expected sign. Several different specifications of sterilisation equations are estimated but the fit of these equations was very poor. Clearly, the MBOP view was found to be not an appropriate model for explaining international reserve movement for India. The results for Pakistan also provided no support for MBOP. Only in case of Thailand the results were found to be not totally inconsistent with MBOP though no definite conclusions were possible from the sterilisation equation.

Since empirical evidence on the applicability of MBOP to the Indian case was found to be inconclusive, with results of Sohrab Uddin and Kannan being at variance with one another, we decided to undertake our own empirical investigations on similar lines for the period 1960-61 to 1985-86. Our results are summarised in Table 1 and Table 2.

The estimated reserve flow equation has a high $\bar{R}^2$ ($\bar{R}^2$ = 0.99) and all the coefficients are of the expected sign and significant at 5 per cent level. An increase in real income (YPD) or prices (WP) are expected to have positive impact on reserves, as both these variables lead to an increase in the demand for money by the public relative to the supply of money. An increase in money multiplier or domestic credit leads to reserve outflow by raising the supply of money relative to its demand.

From the reserve flow equation one might be tempted to argue that MBOP is applicable in the Indian case. However, before we are led to such a hasty generalisation, it is crucial to prove that it is the domestic credit which causes changes in international reserves and not vice versa. In order to see whether such a proposition holds true in the Indian case, we have estimated the sterilisation equation along with the reserve flow equation by the 2SLS technique. The estimated sterilisation coefficient is around

−1.17 and significant at 5 per cent level, while for MBOP validity it should be approximately close to zero. One is, therefore, not sure of the direction of the causation.

The use of Granger's and Sims' test to resolve the causality problem reveals that the causation from international reserves to domestic credit is much more powerful than vice versa. For Granger's causality test the following two equations were estimated:

$$\ln D_t = a_0 + a_1 \ln D_{t-1} + b_0 \ln R_t + b_1 \ln R_{t-1} + u_t$$

$$\ln R_t = C_0 + C_1 \ln R_{t-1} + d_0 \ln D_t + d_1 \ln D_{t-1} + V_t$$

For Sims' causality test the estimating procedures consist of the following:

$$\ln D_t = h_0 + p_{-1} \ln R_{t-1} + p_0 \ln R_r + p_1 \ln R_{t+1} + U_t$$

$$\ln R_t = g_0 + q_{-1} \ln D_{t-1} + q_0 \ln D_t + q_1 \ln D_{t+1} + V_t$$

Looking at the F-values summarised in Table 2, the Sims' test invalidates the core proposition of MBOP that domestic credit creation feeds to BP deficit while the Granger test indicates that there is a strong causal relationship from international reserves (R) to domestic credit and a weak causal relationship from domestic credit (D) to international reserves (R).

The limitations of MBOP in explaining the BP movements in Indian case are now far too obvious. By merely getting a good fit for reserve flow equation one should not be tempted to accept the MBOP validity. Since money is the measuring rod, factors affecting BP will get reflected in money. This is somewhat tautological. What the BP theory should aim at is to go beyond money and look at real and financial factors[6] affecting BP.

The greatest limitation of MBOP, acknowledged by its proponents themselves, is that it ignores fiscal linkages to money supply process. In the Indian context, one of the principal source of changes in H is the net Reserve Bank credit to the government. Table 3, shows that for the period 1960-61 to 1981- 82, this source accounted for more than three quarters of H for most of the years. Kannan (pp 635-36) also acknowledges this factor by pointing to the need for monetary targeting. The political economy constraints in keeping budget deficit in check is apparent to anyone conversant with the Indian economic realities.

TABLE 2: GRANGER AND SIMS CAUSALITY TEST

Null Hypothesis	F-Values
Granger's test	
1) R does not cause D	11.00*
2) D does not cause R	4.71*
Sim's test	
3) D does not cause R	0.71
4) R does not cause D	3.30

Note: * Denotes F-value is significant at 5 per cent level.

TABLE 3: CONTRIBUTORY FACTORS TO RESERVE MONEY, 1960-61 TO 1981-82

Source: Supplement to the Reserve Bank of India, *Occasional Papers*, Vol 3, No 1, June 1982.

This may be the single biggest factor which neutralises the possibility of BP correction through control of money supply.

Notes

[The views expressed in this article are those of the author(s) and not of the institution to which they belong.]

1 Initially, the monetarists felt that since devaluation is a one-shot affair, it can only be a transitory factor in improvement of BP. See Johnson [1972] for instance. They believed that devaluation was inflationary as it adds to aggregate demand. The Fund economists, however, view this MBOP view as a theory which highlights the need for contractionary demand management policies like credit ceiling to accompany a devaluation.

2 The 'Chicago Workshop' views can be found in Frenkel, J A and Johnson, H (eds) (1976), *The Monetary Approach to Balance of Payments* (London, George Allen and Unwin). A collection of research papers of Fund economists is presented in IMF, *The Monetary Approach to Balance of Payments* (IMF, 1977).

3 D A Currie [1976] brings out the implications of sterilisation through fiscal deficits by hypothesising a situation where government deficit equals the BP deficit. In this situation even if the monetary authorities do not intervene in any other way, the drain of high-powered money (H) as a result of BP deficit may be entirely offset by an equal expansion of H to finance the government deficit. Domestic credit will then expand by a multiplicative of H.

4 The vicious circle of cumulative depreciation-cum-inflation is equally likely in the case of the Indian economy where most imports are of intermediate nature. Moreover, since imports are mostly licensed against export commitment, depreciation will also affect export-competitiveness of Indian goods. The stagflationary potential of devaluation and its adverse impact on trade balance in such a case is far too obvious. Output may fall in a dynamic fashion as scale economies are affected.

5 The convention in the literature has been to solve the two equations on reserve flow and sterilisation simultaneously using 2SLS method.

6 Here, we make a distinction between MBOP and the Asset Market Approach (AMA) to BP. AMA is an extension of MBOP. It, however, recognises the alternative to hold funds in form of wide array of financial instruments and so enables one to understand the capital account movements in BP. The AMA propagates that asset market imbalances affect interest rate differentials and expectations of exchange rate changes which affect the capital flows.

Invention of Tradition

In contemporary Indian theatre, to what extent has 'tradition' been used in the context of 'handing over knowledge' or 'passing on a doctrine'? And to what extent has it been 'invented' in response to larger political, economic and social factors? **1907**

Myth of Land Reform

Evaluations of the implementation of tenancy legislation in Karnataka without taking stock of the extent of tenancy in the pre-land reform period have tended to overstate the success of land reform in the state. An attempt to assess the gravity of the problem of tenancy in Karnataka at the time of the reorganisation of states in 1956 and, on that basis, to identify the effect of tenancy legislation in changing Karnataka's agrarian structure. **1896**

Too Little Too Late?

The Common Fund for Commodities, which has at last been ratified by the required number of countries and is to be based in Amsterdam, has come into existence a decade too late and a billion dollars too short in terms of the funds at its disposal. **1885**

Planning and the Capitalist Path

The trends of change in Indian society in the last 40 years can be understood properly only if it is firmly grasped that they are the consequence of the specific path of capitalist development pursued by the rulers, their public proclamations of commitment to a socialistic pattern of society, to centralised economic planning and to building up the public sector notwithstanding. **1887**

As economic planning in India approaches the end of its fourth decade, a sufficient time-span now exists to allow an adequate consideration of its longer-term functioning and achievements in relation to both the domestic and the foreign sectors. Report on a conference. **1877**

Cheerless Teachers

The start of the new academic year in Maharashtra has brought little cheer to college and university teachers in the state. Even after two long-drawn and bitter strikes in the last two years, the pay and perks problems of the teachers, which have occupied so much of their energies for the past decade, have yet to be settled and it does not appear that teachers and the leaders of their organisations will be able to turn their attention to pressing educational tasks. **1875**

Lopsided Growth

Dissection of the growth of the electronics industry in India shows that, with investment decisions left to market forces under the government's economic liberalisation policies, much of the investment has been guided towards less capital-intensive and quick profit yielding consumer goods based on imported and penultimate stage raw materials. This lopsided product structure has had its adverse effect on the industry's capability to generate value added, employment and foreign exchange and has also severely restricted the electronics industry's impact on the growth and modernisation of the industrial sector as a whole. **1915**

Gathering Storm

Article 368 of our Constitution is an open-ended invitation to a cynical government, such as the present one, to push through amendments which progressively snuff out democratic functioning. Some recent political occurrences provide ominous pointers. **1871**

Language speaks the political man. Face to face with the general election, prime minister Rajiv Gandhi has found a new language which now speaks him rather than he speaks it. He treated the Lok Sabha to a fascinating taste of the new language of electoral politics on the occasion of the introduction of the urban bodies bill. **1869**

Expert opinion on the state of the economy and the government's economic policies is increasingly tending to converge and economists of different political persuasions now acknowledge the crisis situations building up on many fronts. **1873**

Dowry Debate: Responding to a Misrepresentation

PLEASE refer to the dowry debate (C S Lakshmi, J P Jain, Madhu Kishwar, Veena R Poonacha and Usha R Lalwani). Even after Madhu Kishwar made it clear that she has never argued in favour of treating dowry as inheritance Lakshmi, Veena and Usha continue to misrepresent her and criticise her, and me for supporting her argument. This can only be described as intellectual dishonesty.

Veena and Usha accuse me of wishing away unpalatable facts by refusing to accept the veracity of the example cited by Lakshmi as proof that dowry is something that forces fathers to sell their kidneys. Let me give a few facts in favour of my conviction that *anti-dowry campaign without effective inheritance rights for women is anti-woman.* Let Veena and Usha decide whether they find them palatable.

I have five sisters all of whom are married. The oldest age of marriage was 24 years. Now I am 32 years old and if I calculate the rental value of my parents' house, where I have lived for at least eight years more than any of my sisters, it amounts to much more than the dowry given to any one of them even after taking into account the inflation and interest. Whenever I raise the question of my sisters' shares in this house it evokes the most hostile response from my parents and brothers. My sisters, of course, never dare raise the issue. They in fact dare not think of a right even to stay in their parents' house, even for a week, of their own volition.

When my youngest sister Santosh was married she was, of course, not involved in any decision-making, except the choice of colour and design of her sarees, chappals, etc. My father provided a dowry that was much less than the amount he had promised to her in-laws. This was certainly not for lack of means, because soon afterwards he invested heavily (more than the dowry amount) in buying conveyance for one of his sons and in enlarging his house. My sister had to face harassment at the hands of her in-laws for the breach of promise. Even now, whenever my sister raises this issue with my father, she is shouted down for being too greedy for dowry. Now if my father relates his version to the anti-dowry campaigners like Lakshmi, Veena and Usha, they will be easily duped into sympathising with him without verifying the (unpalatable) facts behind the whole episode.

I will highlight the profile of an anti-dowry campaigner by citing another example. Recently my brother beat his wife (her name is Veena) and she approached a social worker, Savita Dogra. The social worker took her to the police station and despite my sister-in-law's vehemant assertion that there was no dowry demand in this case, she made her lodge a complaint of dowry harassment. She also collected her group of anti-dowry campaigners and raised slogans against dowry in front of my brother's house. The irony of the whole episode is that the social worker told my sister-in-law at the police station that she was getting her daughter married and was going to spend about a lakh of rupees for this marriage. When she was to justify the giving of dowry to her daughter, she clarified that it was not dowry because she was giving it of her own volition and without any demand for it from the groom.

All the cases of bride deaths (suicides and murders) I have come across amongst my relatives, neighbours and acquaintances, were described by the parents as dowry deaths but on slightest of probing none of them was remotely connected with any dowry demand. (I have not revealed the names here for lack of space but if Lakshmi, Veena and Usha are interested I can introduce them to at least six such cases.) My point of contention is that by branding these cases as dowry deaths, attention is diverted from the real and myriad forms of domestic harassment of women and their lack of options, especially the lack of assurance of a place in their parents' house and the consequent inability to walk out of a violent marriage.

It is easy to state for argument's sake that inheritance implies a share in the family property on the death of parents but apart from my own example if they only look around Veena and Usha will see innumerable examples of sons continuing to live in their parents' house even after marriage and taking possession of business, land, shops, etc, and other income generating assets much before the death of their parents.

Lakshmi says that when dowry becomes a condition for marriage the woman also accepts other terms that go with it like working or not working, deportment, responsibility for household work, ritual celebrations, choice of having children, accepting a partner chosen by parents, etc. I would like to know from Lakshmi how many cases of refusal of these terms have followed refusal of dowry. I can certainly give her examples of marriages amongst my acquaintances where young girls have been married to widowers (who have children or who are bride murderers) and to bigamous grooms (Hindus) to save on dowry and to get rid of the girl at the same time.

When Lakshmi says that a working woman's job is also considered dowry, does she as an anti-dowry campaigner recommend that women should not work for income after marriage? Again consider the case of 15-year old Sneh Lata, who immolated herself because her father had decided to mortgage his house for her marriage. I don't imply that her father should have sold his house to provide for her dowry. What I contend is that when the parents who perpetrate the custom of dowry by demanding it for their sons and then criticise it at the same time, the only purpose this criticism serves is to make the girl feel guilty of a 'crime' which she is not even given a choice not to commit. Dowry is a ploy to deny the daughters a right in the property of parents and it can only be eradicated by ensuring inalienable equal property rights to the daughters.

When I ask for the address of the supervisor who donated his kidney to arrange for the future dowry of his daughters, I am not doubting the veracity of an unpalatable fact. I merely want to convince myself that there exists a male victim of dowry because so far I have only heard of female victims of this abominable custom. Even in the example given by Veena and Usha it is a woman who is victimised and I shall not desist from expressing my curiosity to know whether the mother of the maid servant made her sons also sacrifice their careers in the same manner as she made her daughter do.

I have tried to give names in all the examples quoted by me and I am always available to help in establishing the veracity of every example given by me.

ECONOMIC AND POLITICAL WEEKLY

Charade of Debt Relief

WHEN the Brady Plan was first announced, doubts were expressed in these columns about how much difference it would actually make to the third world's debt problem. It may have marked an advance over the Baker Plan in conceding the case for reducing not just the burden of debt servicing but also the burden of debt itself, though the basic objective evidently remained that of ensuring some net inflow of new capital into the countries burdened with heavy external debts. By envisaging debt reduction as well, the Brady Plan could be said to have shifted the emphasis in the matter of debt relief to the long-term. However, the fact remained that if the immediate purpose was to ensure a net capital inflow into the debt-ridden countries, the impact of whatever debt relief plan was worked out on current debt servicing (i e, outflow on account of repayment of principal and interest) had still to be the touchstone. The doubts expressed in these columns with respect to the Brady Plan related to its vagueness not only on the numbers envisaged but also on the size of net capital inflow aimed at in return for the conditionalities imposed on the debtor countries. Of course, the basic argument against the Brady Plan as also its predecessor, the Baker Plan, has been that it takes no account of the debtor country's debt-servicing capacity as reflected in its export earnings. Any plan that ignores this basic statistic is bound to come to grief.

Now, after a long and gruelling process of negotiations extending over a period of four months has emerged an agreement said to have been negotiated under the Brady Plan. In fact, Nick Brady, US treasury secretary, is reported to have been personally involved in the final phase of the negotiations among the parties involved, namely, Mexico and the major lender banks, with the World Bank and the IMF possibly making their inputs from the sidelines. According to the agreement, the commercial banks to whom Mexico owes some \$ 69 billion—out of the country's total external debt of \$ 100 billion—have been offered three options: (1) they may reduce the outstanding existing loans by 35 per cent and swap them for 30-year bonds; (2) they may reduce the interest rate from the present floating rate, currently 9.5 per cent but which has ranged from 9 to 14 per cent, to a fixed rate of 6.25 per cent on 30-year bonds of the same face value as existing loans; and (3) lend new money to the extent of 25 per cent of their current exposure over the next four years. The interest payment on bonds accepted by banks under this arrangement is guaranteed for the next 18 months at least. The World Bank, the IMF and Japan have joined Mexico in setting aside \$ 7 billion to finance the guarantees. The US treasury will provide an immediate bridge loan of \$ 2 billion.

What does it all add up to? When the negotiations started, the Mexicans' target was a 55 per cent reduction in their total bank debt. It now appears that under the plan agreed upon, debt reduction may not exceed \$ 4 billion, i e, a mere 6 per cent of Mexico's total debt to the banks. As for reduction in interest payments, the most optimistic estimate, as put out by the US treasury, is \$ 1.5 billion as against Mexico's annual interest payments bill of \$ 9.6 billion. This means a reduction in interest payments of 15.5 per cent. Whether or not some banks will choose at all to opt for the third alternative, namely, to lend new money without agreeing to any dilution of their existing loan or the interest due thereon only time will tell. But here again the best that can be counted upon is a capital inflow on this score of \$ 2.5 billion. All this does not by any means ensure that Mexico will, at the end of the day when all the details have been worked out, be anywhere in sight of a net capital inflow under the new accord so that the country can think of rebuilding its economy and putting it back on a reasonable growth path.

Mexico was not being over-ambitious in expecting a sizeable reduction in debt and debt servicing. After all, it has been known for some time now that third world debt has been traded in the secondary debt market at discounts exceeding 66 per cent. With guarantees forthcoming under the Brady Plan from the international financial institutions and countries like Japan, over and above the pledging of resources by Mexico itself, it surely was not too much for Mexico to look forward to a 55 per cent debt reduction. But all that Mexico may actually end up with is a debt reduction of a mere 6 per cent. Interestingly, it would appear that if the accord Mexico has been able to work out with its creditor banks is taken as a guide, the situation today is not significantly different from what it was in the period after the Baker Plan was announced in 1985. It is still to be a matter of case-by-case negotiation of some reduction or staggering of the debtor country's current debt servicing liability in return for the country accepting various conditionalities.

This proves the doubting Thomases generally right when they are cynical about these so-called debt relief plans—Baker, Brady or what have you. All these plans are really meant not to help the debtor countries but to give the creditor banks more time to make adjustments. The debtors will continue to be kept on a leash, no matter how high the discount on their debt in the secondary debt market. If anything, the accord on the Mexican debt exposes more plainly the real intent behind these debt relief plans. What is significant is that even the so-called multilateral institutions are ready to play this game. But whoever said that these institutions did not ultimately take their orders from the few rich and powerful nations?

KARNATAKA

Suppressing Peasant Struggles

AURANGABAD in Bihar, Warangal in Andhra Pradesh, Bastar in Madhya Pradesh and now, it is the turn of Raichur in Karnataka. The police have begun to terrorise peasants who dare to fight against the feudal oppression of their landlords.

Over the last few months, several activists of the PYC (Progressive Youth Centre), an organisation which had been leading peasants' struggles in Karnataka, have been arrested, tortured and implicated in false cases by the Karnataka police. The so-called 'anti-Naxal' squads of the Karnataka state government in collaboration with their counterparts of the Andhra Pradesh government (since Raichur borders Andhra Pradesh) are known to have stepped up their operation against peasants' organisations in these areas. On July 6, two activists of the PYC, Chouri and Babu, were arrested from a village in Raichur, and till today have not been produced before any court. On August 3, a young advocate, Narasappa, who had earlier intervened to locate Marappa, the district secretary of the Raichur PYC (who was taken away by the police some time ago), was dragged out from his house by the police, beaten up and taken into custody. Now the Raichur superintendent of police has issued a statement alleging that both Marappa and Narasappa had been involved in a bank dacoity.

The role of the judiciary in Karnataka—as in other states in similar cases—has been deplorable. When a *habeas corpus* petition was filed for the production of Chouri and Babu before a division bench of the high court, the two judges comprising the bench dismissed the petition (on August 2). Incidentally, the same two judges on an earlier occasion had dismissed a writ petition filed by civil liberties activists in connection with the arrest of Veeramani, the state secretary of the PYC, who was handed over to the Tamil Nadu police by the Karnataka police. The Tamil Nadu police implicated Veeramani in a bank dacoity case, but had to release him in January 1989 after three and a half months, when they admitted that he had had nothing to do with the dacoity.

The ire of the Karnataka government against PYC is understandable. Along with its sister student organisation the Pragathipara Vidhyarthi Kendra (PVK), it has been spearheading struggles all through Karnataka against the eucalyptus plantation programme of the government, the Kaiga atomic power plant and other cases of environmental degradation. Since its inception in 1981, it has been active in the struggles of the textile workers and the release of bonded labourers in Kolar district. From 1986, it started organising the peasants in Bidar and Raichur. In Bidar, the Karnataka governent collected thousands of acres of land from the small farmers to promote eucalyptus plantation in order to supply timber to the Birla factory. The PYC launched a struggle for the reoccupation of these lands and to restore foodgrains production there. In Raichur, the PYC organised peasants in some villages to fight against the oppressive landlords there.

State governments, whether run by the opposition, the Congress(I) or the president (as in Karnataka today), never learn from the past. Wherever the authorities had treated peasant's struggle against feudal oppression as a law and order problem and had deployed the trigger-happy police to suppress peaceful democratic demonstrations, and wherever a servile judiciary had refused to protect the victims of such oppression, the poor peasants had been forced to take up arms and seek justice outside the prevalent politico-juridical system. Raichur may be forced to go the way trodden by the peasants of Bhojpur, Aurangabad, Jehanabad, Adilabad, Warangal, and now in the forests of Bastar.

SUGAR

Production Expectations Belied

OVER the last two months, sugar prices have been rising continuously. Although the government has taken a number of steps such as higher monthly releases, restrictions on a weekly basis on the sale and despatch of sugar by factories and imposition of stock limits on traders, it has not been successful in arresting the spiralling prices. Rather the trend has become more bullish in recent weeks. Last month, for the first time in eight years, the open market price of sugar touched Rs 9 a kg at the retail level. This month it has gone up further. Currently sugar prices in the wholesale markets are ruling between Rs 940 and Rs 975 a quintal. Trade circles expect them to cross the Rs 1,000 mark soon in view of the festival season. At the retail level, the prices will be well above Rs 10 a kg. In large parts of the country sugar is no longer available at the controlled prices through the public distribution system.

A number of factors have contributed to the unprecedented spurt in sugar prices in recent weeks. Although the country had started the current sugar season on an optimistic note, there has been a big drop in sugar production in the past few months. Consequently, against the initial expectation of sugar production touching a new peak of 10.2 million tonnes in the current sugar season (October 1988 to September 1989), surpassing the previous season's output of 9.1 million tonnes by over a million tonnes, production may actually turn out to be only about 8.7 million tonnes, even as consumption is expected to cross the 10 million tonne mark. The optimistic projection made initially was based on Krishi Bhavan's forecast at the commencement of the season of a record sugarcane crop of 198 million tonnes, an impressive increase of 18 million tonnes over the previous season's production of 180 million tonnes. As it turned out, the agriculture department's forecast of cane production was wide of the mark. Actual production of sugarcane is unlikely to exceed 185 million tonnes. In fact cane supplies to sugar mills in different parts of the country had almost dried up by April-end and a majority of the mills had to discontinue their operations. The sugar industry had been able to achieve a record production last year mainly because it had managed to corner a larger share of the available cane at the cost of gur and khandsari units by offering much higher prices to farmers. This year, the opposite has happened.

With the big drop in production, earlier hopes of the country becoming self-sufficient in sugar and even emerging as a net exporter have been dashed, and the government has had to consider importing at least five lakh tonnes worth over Rs 500 crore. The delay in the release of foreign exchange for sugar import has added to the upward pressure on prices. There are also reports of large quantities of sugar being smuggled out of the country, accentuating the shortage. These reports may not be baseless as sugar prices in Nepal and Bangladesh are known to have crossed Rs 30 a kg.

The proposed nation-wide strike by sugar industry workers in the coming sugar season on the pending wage revision issue has also added to the bullish sentiment. Naturally, speculative forces have become very active. There is reason to believe that substantial stocks have gone underground in anticipation of the shortage getting aggravated. The government notification imposing restrictions on sale of sugar among wholesalers in Punjab, Haryana, Uttar Pradesh, Bihar, Andhra

Pradesh, Tamil Nadu, Karnataka, Gujarat, Maharashtra and Delhi has had no effect. The hike in the minimum margin requirements for bank credit by the Reserve Bank from July 20 by 7.5 per cent to 25 per cent on sugar stocks with mills and by 15 per cent to 75 per cent on stocks with trade has also failed to curb the rising prices.

WEST BENGAL

Hasty Action

THOUGHTLESS action by the Left Front government has landed its leading partner in a messy situation. All on a sudden and without any sort of notice either to the general public or to the institution/persons concerned and even without mutual consultation within the Front, the local self-government and urban development minister, CPI(M)'s upcoming young leader, Buddhadev Bhattacharya, superseded the Congress(I)-held municipal administration in the town of Behrampore in the Murshidabad district.

The state Congress(I) which had been, presumably on getting the nod from the party high command in New Delhi, trying to put up some sort of a counter-show in CPI(M)-led West Bengal to blunt the edge of the opposition's 'Bharat bachao' campaign, if and to the extent possible, received the Left-Front government's Behrampore ukase as a god-send. Less than a week ago, the state Congress(I) had organised a not at all unimpressive 'jail bharo' campaign on August 2, in the course of which it was able to 'invite' police lathi charges in several places in a number of south Bengal districts. More than 75 Congress(I) workers were reportedly injured and 55,000 arrested, according to official estimates. The state Congress(I) chief, A B A Ghani Khan Chowdhury who had personally led the show in Calcutta called upon his followers "to free West Bengal from the clutches of the CPI(M) and its allies". "There is," he declaimed, "the need to purify the soil of West Bengal and if in doing so some lives have to be lost, so be it".

With this as the immediate background, Chowdhury's party lost no time in responding to the government's provocation, with a wide-fronted counter-attack, ranging from a writ petition to the Calcutta High Court through a series of meetings and demonstration to a quite impressive bandh in Behrampore town and its vicinity. The last was accompanied by the usual quota of police lathi charges. It would be premature to conclude that the agitation has run out of steam.

What compelled the Left Front government/minister to take the drastic step of superseding an elected body at this particular juncture is not at all clear. The official explanation about the prevalence of corruption and inefficiency hardly washes. For these are not unique accomplishments of the Behrampore municipality. The leading municipal institution, the Corporation of Calcutta, presently headed by a CPI(M) mayor cannot be said to have outgrown its well known traditional epithet of 'chorporation'—a thieves' den. Even the CMDA, directly under the minister who initiated the supersession, has recently been castigated by the CAG for similar failings in more than a dozen cases. Let alone public opinion, the minister has failed to carry conviction even with his Front partner, the Forward Bloc.

This light-hearted—and light-headed—action of the CPI(M) minister clearly betrays his—and his comrades'—lack of understanding of the gravity and explosive potentialities of the prevailing situation in the wake of the opposition's withdrawal from the Lok Sabha and the circumspection that the situation demands of the Left leaders.

NICARAGUA

Qualified Victory

'MANIFEST DESTINY' appears to have come a cropper in its own backyard. The Contras have been all but laid to rest with the signing of the Tela agreement by the five Central American presidents—those of Costa Rica, El Salvador, Guatemala, Honduras and Nicaragua—and the US, which, having revived the Monroe doctrine, had taken to prowling about the region, has emerged from the caper more than a little embarrassed. The accord, signed ten years after the Sandinista National Liberation Front ousted the effete Somoza regime, offers hope for the termination of the devestating eight-year old civil war between the Sandinistas and the Contras that has left in its wake a trail of destruction. The five-nation pledge disavows the use of their territories for destabilising other states and seeks to prevent aid to armed groups. The accord envisages the demobilisation and repatriation of the Contras to be effected through the instrumentality of the International Commission of Support and Verification, consisting of the secretaries-general and representatives of the United Nations and the Organisation of American States, which is to be formed within 30 days of the signing of the agreement. The com-

TWENTY YEARS AGO

EPW, August 16, 1969

With the outcome so precariously dependent on the frisky consciences of so many self-proclaimed Gandhians, this is not the best time to write about the power struggle in the Congress... The safest course in the circumstances is to go back to the beginning and ask what it is all about. Is it really a fight for the presidentship, stemming from the calculation that in a fluid political situation, such as might emerge after the 1972 general election or much earlier, the president could decisively tilt the balance of power within the party? Or is it the conflict over ideology, with the prime minister deciding that the time had come to translate socialistic slogans into action? Or is it, again, a tussle between those who are surreptitiously seeking an understanding with Jana Sangh, Swatantra and those who are looking for an opening to the Left?... None of these, it appears, is of the essence of the matter. The present conflict really represents the surfacing of issues left unsettled at the time of the supposedly 'smooth' succession after Jawaharlal Nehru. Both Lal Bahadur Shastri and Indira Gandhi had secured the prime ministership with the so-called Syndicate's active support. Apart from the fact that it could not agree on anyone else, Indira Gandhi was supported by the Syndicate because the party needed a vote-catcher for the 1967 election. Relevant as this calculation was, it was not enough to ensure a working relationship between the party and the prime minister. It did not take the Syndicate long to find out that by virtue of her office the prime minister acquired a position in the party which upsets its own king-maker relationship with her. For her part, the prime minister realised that without much greater direct influence over the party, she would be permanently cramped in her role as the head of the government and leader of the party in parliament. For the first time, conflict between the organisational and the governmental wings, which had been confined to the state level during Nehru's time, now emerged at the centre and has persisted ever since... As the developments of the last few days have once again confirmed, when the chips are down effective power in the Congress is with the state leaders... Factional squabbles at the centre encourage factionalism lower down and foster opposition to established state leaders. From this point of view, these leaders have an interest in backing the prime minister because they know that there is practically no stable alternative to her.

mission is to be entrusted with the responsibility of facilitating the demobilisation, repatriation or relocation of the Contras within 90 days of its constitution. The Tela accord follows a bilateral agreement between Honduras and Nicaragua trading off mutually contentious issues. Thus, Honduras agreed to demobilise the Contras in response to the Nicaraguan offer to withdraw the charges it had lodged with the International Court of Justice at the Hague, and drop the demand of compensation for loss suffered due to the activities of the Contras operating from Honduras.

Semantic hair splitting may yet pose a few problems. The word 'voluntary' in the original Spanish text lends itself to differing interpretations. While president Ortega of Nicaragua holds that the word voluntary pertains only to the issue of repatriation and relocation, and that disbanding the Contras is mandatory, both Arias of Costa Rica and Azcona of Honduras have categorically rejected the use of force in the disbanding process. But this discord between the signatories can bring little solace to the Contras. Even if demobilisation is to be a voluntary exercise, the Contras will nevertheless be adversely affected. In the first place there are an estimated 3,000 to 4,000 men forcibly conscripted into their ranks. Consequently voluntary disbanding will find takers among at least a fourth of the total Contra muster of 10,000 to 12,000 currently sheltering in Honduras. Again, the complexion of regional politics has undergone a transformation. Honduras, which played host to the Contras for long, is no longer keen on their continued presence lest it lead to internal instability. The terrain, thus, is altogether too hostile for Contra activities. Bereft of the kind of support that they have been accustomed to receiving from their benefactors, the military potential of the Contras is likely to be severely attenuated. In the face of such odds sheer survival demands the repudiation of armed struggle. Consequently demobilisation is an eventuality that they will have to accept.

Their last hope too has been reduced to mere straw. The Bush administration's last ditch effort to prop up the Contras, by pressurising the other Central American leaders to delay the disbanding until the forthcoming February polls in Nicaragua on the ground that the Sandinistas might renege on their commitment to conduct elections, has yielded no results. With the emphatic refusal to make the demobilisation conditional on the Nicaraguan election the Contras have been left without an option.

The agreement has provoked strong reactions from right wing Republicans, who have criticised the administration for permitting what they term 'a sell out of Contras'. The administration has in response conveyed its displeasure to Arias. However, American displeasure unaccompanied by tangible expressions of it—economic or military intimidation—appears to have had little effect.

The Sandinistas will have every reason to welcome the termination of a war that, in eight years, has ravaged the farm economy, put the exchequer under severe strain and most importantly left 58,000, out of a population of about 3.5 million either dead or wounded. The Contras, likened in Reagan's panegyrics to the 'American founding fathers' and recipients of military training and aid from the US, had made a fetish of attacking schools and health centres and wiping out the landless beneficiaries of the agrarian co-operative reform movement, in an effort to obliterate the visible achievements of the revolution. However, the removal of the military threat is only a partial salve for the Sandinistas' problems. There is, first, the problem of post-war reconstruction, to be undertaken in the face of a sustained US embargo. Moreover the agreement is not likely to stop covert US interference in Nicaragua. For the February 25th election, involving 21 parties including the Contras, the US has been generous in funding the opposition. If anything has changed in the US policy towards Nicaragua it is the form more than content. The Reagan administration's palpably obtuse policy of aggressively transplanting a 'Rambo' fantasy on an unyielding reality derived from an overdeveloped phobia for left wing regimes. The same pathological condition, which sees a security threat in an impoverished nation of 3.5 million people, still lies at the root of the current administration's policy towards Nicaragua. Reagan refused to let reality contaminate his vision and persisted with the military option, which included such disreputable intriguing as the Iran-Contra scandal. The current administration, a little more in touch with Central American reality, recognises that military options short of direct invasion will not produce the desired end. Consequently it will not be unlikely if the US turns to covert activities, at which it is far more adept, in order to destabilise the Sandinistas.

LARSEN & TOUBRO

Focus on Core Sector

LARSEN & TOUBRO has turned in encouraging working results for the 18-month period ended March 1989. Sales have amounted to Rs 1,085 crore against Rs 559 crore for the previous period of 12 months, gross profit is Rs 109 crore against Rs 67 crore and net profit is Rs 42 crore against Rs 28 crore. These figures, however, show significant contraction of profit margins. The directors have recommended a dividend of 30 per cent against 20 per cent paid for the preceding 12 months. The distribution is covered 2.45 times by earnings as against 2.65 times.

Cement production was 23.66 lakh tonnes. The second cement plant at Awarpur went into commercial production in October 1987 and its operations were stabilised by January/February 1988. The shipping division performed well due to the sharp increase in freight rates since the first quarter of 1988.

The company fared well on the export front too. It exported hydraulic excavators to Iraq and suspended particle drying plants for dyestuff to Thailand. It also received an order for two such plants from the USSR. The company has entered the South Korean market for air circuit breakers. Its bottle closures are exported to several countries against stiff competition from established international companies. Castings were exported for the first time to West Germany and Nepal. The company also received an order for export of floppy disk drives to USSR.

The company has developed capability to weld duplex stainless steel used in process skids and modules for offshore oil platforms and x-20 alloy steel used in high pressure piping in thermal power plants. The company's heavy engineering complex at Hazira has become fully operational to undertake heavy and sophisticated fabrication. Located on the water front, it has facilities for load-out and lifting 500 tonnes apiece. The company has successfully diversified into the field of 400 kv transmission lines and its unit for fabrication of transmission line towers at Pondicherry is ready for commercial production.

The company has received a letter of intent for the manufacture of wheeled tractor loader backhoe at Pithampur, MP. The company has entered into collaboration agreements with Sundstrand Sauer, USA, for the manufacture of axial piston units; with Case Vibromax, West Germany, for the manufacture of vibratory compactors and with JI Case, USA, for the manufacture of wheel loaders. A memorandum of understanding was signed between the company and Colas SA of France for setting up a joint venture company for the production of asphalt emulsion. At Mysore, the company is implementing a new project for the manufacture of medical electronics products, viz. electro-surgical equipment, ECG equipment, ultra-sound scanners and patient monitoring systems.

Commenting on the prospects, the new chairman Dhirubhai H Ambani says there are very good immediate prospects of booking orders in the areas of modernisation of steel plants, nuclear power programme, oil and gas, petro-chemical complexes, etc. The company has already booked some large orders since the beginning of the current financial year. The management is also planning to get into new activities related to the core sector of the Indian economy.

ESSAR GUJARAT

Export-Oriented Steel Project

ESSAR GUJARAT has registered all-round growth in turnover and profits in the year ended May 31, 1989. Total income rose from Rs 47.38 crore to Rs 50.8 crore. Gross profit rose to Rs 19.91 crore (Rs 13.82 crore) and net profit after depreciation and taxation was Rs 10.28 crore (Rs 6.10 crore). The directors have recommended a dividend of 35 per cent on the increased equity base.

The three divisions of the company—energy, offshore and construction—continued to maintain their progress in their respective areas. Among the noteworthy achievements during the year were the successful commissioning of four mobile rigs for drilling 120 developmental wells in the Cambay basin, drilling of the country's largest oil producing well on land at Nada in Gujarat and completion of the Off-shore Water Injection Project. The energy division has received a letter of intent for an additional land rig which is expected to start operations during the current year.

The implementation of the first phase of the company's sponge iron project with a capacity of 8.8 lakh tonnes per annum has made good progress. All the major plant and machinery have arrived and it is expected that the plant will start production in the first quarter of 1990, ahead of schedule. With the sponge iron plant going into production the company's turnover is expected to rise significantly.

The company has received a letter of intent for setting up a 100 per cent export-oriented steel plant for manufacturing steel

IN THE CAPITAL MARKET

Bindal Agro Chem

BINDAL AGRO CHEM is setting up a Rs 695 crore gas based fertiliser project at Shahjahanpur in UP to produce 1,350 tonnes of ammonia and 2,200 tonnes of urea per day. The company expects to commission the project in a record period of 24 months from the zero date, that is October 15, 1989. Projects and Development India, a government of India undertaking, has been engaged as prime consultant for execution of the whole complex. Abhey Oswal, chairman and managing director, expects this complex to generate annual turnover of Rs 375 crore. At 100 per cent capacity utilisation, the project will yield cash profit after tax of over Rs 140 crore. Earning per share of Rs 10 will be Rs 10 in the very first year of full operation. To meet a part of the project cost the company proposes to issue fully convertible bonds of Rs 500 crore, subject to approval by CCI. Each bond will be of Rs 200 carrying interest at 12.5 per cent per annum. Out of the total issue, bonds of Rs 100 crore will be offered to the existing shareholders of the company on 'rights' basis and bonds of Rs 400 crore through a public issue. In the public issue, shareholders of Oswal Agro Mills and Oswal Agro Furane and holders of convertible bonds of Oswal Agro Mills will be offered bonds on preferential allotment basis. The company's employees, NRIs and agriculturists will also be offered preferential allotment. Indian public will be offered bonds of Rs 111.25 crore. According to the proposed conversion terms, Rs 50 out of the face value of each bond will be converted into one equity share at a premium of Rs 40 per share on expiry of six months from the date of allotment and balance Rs 150 into 3 equity shares at the same premium on expiry of 18 months. In the case of public issue, Rs 50 will be converted into one equity share of Rs 10 each at a premium of Rs 40 per share on expiry of six months and another Rs 50 on the same terms on expiry of 18 months and the balance Rs 100 on expiry of 36 months.

G V Films

G V FILMS, promoted by G Venkateswaran, a successful flim producer and distributor, is entering the capital market with a public issue of 30 lakh shares of Rs 10 each for cash at par. Out of the issue, 2.5 lakh shares have been reserved for preferential allotment to the employees of the company. This is the first time that a film company has received the consent of the controller of capital issues to make a public issue of shares. The proceeds of the issue will go to finance the company's forthcoming projects. Apart from producing and distributing films, as its long-term objective the company is also exploring the possibilities of entering the communications business, establishing ultra modern studios and cinemas, setting up high-tech video production centres as well as manufacturing cine equipment.

coils at an estimated project cost of Rs 1,400 crore. This project will earn foreign exchange of about Rs 2,500 crore and all the inputs required for the project can be imported free of duty. The profits from this project will be totally exempted from income tax.

GSFC

Higher Lendings

GUJARAT STATE FINANCIAL CORPORATION has achieved all the targets in the year 1988-89. It has sanctioned loans worth Rs 143.74 crore which is 63.8 per cent higher than in the previous year. Assistance rendered by the corporation has generated an investment climate of about Rs 326 crore which will create job opportunities for more than 31,000 people in the state. Scheduled caste and scheduled tribe entrepreneurs have been given financial assistance, under the soft loan scheme at concessional terms, amounting to Rs 591 lakh. Women entrepreneurs have been sanctioned loans of Rs 244 lakh. Of the total assistance sanctioned during the year 66 per cent has gone to backward areas of the state. The disbursement of the loan sanctioned during the year stood at Rs 80.84 crore and recovery of loans amounted to Rs 70.89 crore. The net income of the corporation was Rs 35.47 crore. Managing director Balwant Singh announced that the corporation had evolved a novel approach of arranging spot management screening committee meetings where entrepreneurs could discuss their projects.

VOLTAS

Bonus Shares

VOLTAS' board has recommended issue of bonus shares in the ratio of one share for every two shares held and sub-division of the existing Rs 100 shares into shares of Rs 10 each. The company has turned out good working results for the seven-month period ended March 31 last. According to brief preliminary figures incorporating the operations of Volrho which has been amalgamated with the company effective March 1, 1989, sales including consignment sales, have amounted to Rs 353 crore against Rs 545 crore of the previous 12-month accounting year and profit before interest, depreciation, and tax is Rs 17.85 crore against Rs 29.85 crore. Profit after tax is Rs 8.63 crore (Rs 9.78 crore). The board has not proposed any final dividend. The interim dividend of 14 per cent declared earlier worked out to 24 per cent on annualised basis, as against 22 per cent for the previous full year. The interim distribution has taken away Rs 1.80 crore out of the profits. Transfer to reserves has amounted to as much as Rs 7 crore. As at the year end, reserves stood at Rs 34.84 crore as against the share capital of Rs 13.23 crore. Gross fixed assets were Rs 105 crore and net fixed assets Rs 72.14 crore.

FORM II-A

THE MRTP ACT, 1969

[See Rule 4-A (1)]

Form of general notice to be given to the members of the public before making an application to the Central Government under sub-Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969.

NOTICE

It is hereby notified for the information of the public that INDOFIL CHEMICALS COMPANY, A DIVISION OF MODIPON LIMITED, Nirlon House, Dr. Annie Besant Road, Worli, Bombay 400 025, proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new unit. Brief particulars of the proposal are as under:

1.	Name and address of the applicant	: INDOFIL CHEMICALS COMPANY (A Division of Modipon Limited) Nirlon House, Dr. Annie Besant Road BOMBAY - 400 025. Regd Office: Hapur Road Modinagar - 201 201
2.	Capital structure of the applicant organisation Authorised Issued, subscribed & paid up	: Equity / Preference 20,00,00,000 / 5,00,00,000 7,83,80,570 / 1,45,49,500
3.	Management structure of the applicant organisation indicating the names of the Directors including Managing/Whole-time Directors and Manager, if any	: The Company is managed by the Managing Directors under the overall superintendence of the Board of Directors. Names of Directors are us under: Mr. S. B. Lal — Chairman Mr. K. N. Modi — Director Mr. K. K. Modi — President Managing Director Mr. M. K. Modi — Vice President Managing Director Mr. J. J. Doyle — Director Mr. A. F. Smith — Director Mr. C. O. Metzger — Director Mr. J. T. Subak — Director Mr. M. L. Modi — Director Mr. Prabhat Kumar — Director Mr. S. K. Modi — Director
4.	Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division	: New Unit
5.	Location of the new undertaking/unit/division	: It is proposed to locate the new undertaking in the State of Maharashtra preferably in a notified backward district/area.
6.	Capital structure of the proposed undertaking	: The proposal is to be implemented by the existing Company whose capital structure is given in item 2 above.
7.	In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:	:
	I. Name of goods/articles	II. Proposed licensed capacity
	1. Fat Liquors	6000 MT per annum
	2. Leather auxiliaries	3000 MT per annum
	3. Synthetic Tanning Agents	3000 MT per annum
	III. Estimated annual turnover	About Rs. 40.50 Crores
8.	In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income turnover, etc.	: Not applicable
9.	Cost of the project	: About Rs. 11.32 Crores
10.	Scheme of finance, indicating the amounts to be raised from each source	: Internal resources, rupee and foreign currency loans from institutions and debentures/deposits.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Sd/-
(I. K. GUPTA)
SECRETARY

Dated this Fourteenth day of August 1989

Laying Out of a Rose Garden

Bhabani Sen Gupta

Among the many faults of Rajiv Gandhi's political leadership none is as damaging to himself and to the country as his apparent conviction that he and his party own the Indian state and nation. How can one believe that the prime minister is rearing to take democracy to the frontier village when his government and his party cannot live with a CAG who dares to function as he is required to under the Constitution?

LANGUAGE speaks the political man. Face to face with the national election, prime minister Rajiv Gandhi has found a new language which now speaks him rather than he speaks it. On August 7, he treated the Lok Sabha to a fascinating taste of the new language of electoral politics. The occasion was the introduction of the urban bodies bill, the supplement of the panchayat bill both of which the prime minister determined to pilot himself. He did not speak extempore. Nor from notes. He read a written statement. It is known that the 'speeches' of the prime minister are composed with great care by members of his staff. He himself goes over different versions drafted by different people. The final draft is written under his personal vigil. Rajiv Gandhi rehearses the important 'speeches' he delivers.

This particular speech was remarkable for several reasons. Perhaps the most remarkable about it was a sentence that Rajiv Gandhi spoke with special care. The nation, he implored, should "get out of the colonial categorisation of India into separate rural and urban India by a rural-urban continuum, which threads the furthest rural hamlet to the largest megapolis in a *rudrakshamala* of democracy and devolution".

This single sentence of a very important speech shows up the great toils the prime minister has been making in recent weeks to measure up to the challenge of an election which he has to fight without the great advantage of the assassination of Indira Gandhi. He is himself grappling heroically with the task of discarding his urbane upper middle class image and wearing the mask of a villager. More than anyone else, Rajiv Gandhi needs an urban-rural continuum in his own image. He must be seen by the rural mass of Indians as their *bhaiya.* He must be able to wriggle out of the vintage Rajiv Gandhi image of a technocrat trying to pilot India to the 21st century on the wings of imported technology.

Rajiv Gandhi persuaded himself in 1988 that he was on the trail of the mantra that would transform him from an urban technocrat into a villager. From Rajiv Gandhi to Raju Gonda. All through the year he was in search of grassroots democracy, a flagship on which power could smoothly sail from the 'power-brokers' to the people through the relatively placid waters of a parliament in which his party held a brute majority. In the summer of 1989, he stood formidably armed with two grand pieces of legislation which, passed and given presidential consent, would make periodical elections to village panchayats and urban municipalities and corporations constitutionally mandatory. Proudly he piloted both legislations in the two houses.

If those who wrote the script for him had mucked up history and blotted out facts known to many Indians, it wasn't the prime minister's fault. He has never been a student of Indian history, has he? Did he ever have an emotional or physical problem with 'British colonialism'? True, his parents and his grandfather had gone to jail, and had been at the forefront of the freedom struggle. But he grew up in plenitude and affluence and enjoyed the hospitality of the British educational system to train himself for the career of an airline pilot, though not of a prime minister.

When did the British divide India artificially into urban and rural? They conquered an India that was overwhelmingly rural and they left an India that too was overwhelmingly rural. If anyone divided India into an urban enclave and a rural universe of poor masses, it was Mohandas Karamchand Gandhi, not related to Rajiv Gandhi. The Mahatma brought the two together in the largest and longest freedom struggle waged anywhere in the colonies and semi-colonies without violence. One can quote chapter and verse from the Mahatma's speeches and writings to show how the Mahatma tirelessly and persistently tried to narrow the gap between the two Indias and how he said the failure to do this as one of the major unsuccesses of his lifelong struggle for the emancipation of the poverty-shackled rural humanity.

The British did keep India divided against itself. They divided it by religion. They helped the Muslim League to craft and develop the two-nation vision of India and to sell it successfully as a political reality. They rooted on the dangerous divide of Hindus into 'caste Hindus' and scheduled castes.

The urban-rural divide was a grim reality of underdevelopment. The development model that was chosen by Jawaharlal Nehru with the consent of almost the entire elite and in the tooth of the Mahatma's agony had a clear bias for the cities with its emphasis on building heavy industry and a national base of science and technology. The national leadership discarded the Gandhian developement model woven around molecules of self-sufficient, self-governing villages. Land reform was eschewed as poison. The Americans rushed to help with mountains of grain shipped under the generous terms of PL-480 until Indira Gandhi discovered that the price was support for Washington's Vietnam war or at least non-criticism of Johnson's escalation of the war in the mid and late sixties.

It is not being suggested here that the Nehruvian model was wrong. It had undoubtedly the right kind of developmental thrusts, and these have, in forty years, given some substantive independence to the Indian economy. It would have been more right if rural India was not neglected, if land reforms were added to the building of heavy industry, if food self-sufficiency was aimed at in the fifties rather than at the turn of the seventies. The point that is being made is that the urban-rural divide that accounts for much of India's present discontent is the inevitable result of the development model pursued in India under successive Congress-run governments, from Jawaharlal Nehru to Rajiv Gandhi.

This divide has assumed major political dimensions in 1989. Rural India is no longer the political fortress of the ruling Congress party. The peasants have emerged as the largest and newest politically organised segment of the population. The sweep of the peasant movement extends from Haryana to Maharashtra, covering the political swathe of India where the Congress(I) is most vulnerable. The prime minister has therefore been trying a language of politics which will soothe the ears of the villagers and bring them to the once-pervasive electoral hold of his party.

A fascinating word of that language is *rudrakshamala.* It has a religious soft-tone and a homespun undertone. It symbolises the holy and the pure. It stands for simplicity, the dignity of the humble. It symbolises moral power, derived from a divine source. It stands for peace and harmony. Whoever among the prime minister's speech-writers picked up the word deserves a pat on the back. One can imagine how amused Rajiv Gandhi was to have the word at the tip of his fingers and how delighted he was to think of its potential power to influence the mind of the villager. Here was the prime minister of the country about to link the largest megapolis to the humblest frontier village with the holy, harmonising, peaceful thread of the *rudrakshamala.* He who wields the *rudrakshamala* must be, and is, above corruption and selfishness. He is the epitome of humility.

But did the emotive word reach the people in the humblest hamlets and the most arrogant metropolis? Delivered on the floor of the Lok Sabha, the statement could not be telecast live or even in a recorded programme. Carried in Hindi newscasts, it did not particularly hit its target ears. The peasants who gathered on the banks of the Ganga Canal near Muzaffarnagar under the leadership of Mahendra Singh Tikait were not impressed. Tikait himself did not think much of the two legislations on the floor of parliament that, the prime minister promised, would 'revolutionise' Indian politics. The *Times of India* in a nationwide survey came up with the chilly warning that the panchayat raj argot would not enable the Congress(I) ship to sail through the electoral ocean that is rural India. The ocean is too vast and too turbulent. The flagship means little to the villagers. Despite its heavy cargo of words and promises.

That does not mean that the legislations are not important. They are. They provide India with a democratic infrastructure, the lack of which is the single biggest weakness of our democratic system. The panchayati raj created in the 1950s perpetuated the agrarian *status quo*, giving the kulaks the sway of rural India. Even the partyless elections were not held by Congress governments for 10-18 years. It was the same story with municipalities. Of the 300 odd municipal corporations in the country, more than 60 per cent are superseded, and most of them are in the Congress-run states. If any group of power-brokers have stubbornly refused to transfer power and resource to the local bodies and done everything necessary to perpetuate the rural *status quo*, it is the ruling Congress(I) party.

It is this recorded historical fact that Rajiv Gandhi's long 'fighting' speech or statement in the Lok Sabha deliberately ignored. He pretended that the opposition parties stood between centralised power and the people, that they were opposed to the creation of democratic self-governing bodies in the villages and towns. That too was a deliberate falsification of recorded contemporary history. The example of four opposition-run states building effective, though different, networks of panchayats persuaded the prime minister that he too must proceed in that direction if he were to get the support of rural voters. For understandable political reasons, he had to trivialise the panchayat or zilla administration systems introduced in West Bengal, Tripura, Karnataka and Andhra Pradesh. But he could not have remained indifferent to the fact that these states were the strongholds of opposition parties which, except for Tripura, his party could not snatch away through the electoral process.

The concept of building a constitutionally provided democratic infrastructure in the country has been in the air for several years. In the minds of persons genuinely and honestly concerned with the health and vigour of Indian democracy, this is organically linked with an overall democratic restructuring of the political process, with significant transfer of power and resource from imperial Delhi to the states and then to the local bodies. The pressure for decentralisation grew enormously when the Congress(I) lost Andhra Pradesh and Karnataka in 1983. Indira Gandhi promptly appointed the Sarkaria Commission to review the gamut of centre-state relationships even though she took her own time to issue the commission's terms of reference. At a seminar in Bangalore in 1984, much conceptual and operational work was accomplished to give decentralisation a constitutional frame. The Centre for Policy Research of New Delhi worked as the 'think tank'. The political initiative came from Ramakrishna Hegde, then chief minister of Karnataka.

In June 1986, a group of scholars, drawn from CPR and other bodies, met with the prime minister for a broad exchange of views on domestic and neighbourhood issues. The political presentation underlined the urgency of creating a network of elected bodies in the villages and urban areas. It was argued that there must be a constitutional mandate for holding elections to local self-governing bodies every five years and that the resources to be transferred to these local self-governing bodies should also be identified in the Constitution. In the absence of an infrastructure of democratic self-government, the states were facing popular pressures far in excess of their capacities to endure them, while a great many local issues were being transported to the heart of Delhi to confront the national government. Furthermore, only a network of self-governing bodies at the local level could provide India with a live school for the training of political leaders and administrators tuned to the needs and urges of the common people.

It was not before 1987 that Rajiv Gandhi woke up to the idea. He realised after the state elections of that year that panchayat power alone could make the Congress(I) hold in the country-side strong and durable. He worked through 1988 on the concept, but, somewhere during the process, he was seduced bv the idea that the central government in Delhi must keep as much of the third-tier under control through the obliging instrumentalities of governors and collectors. To the best in knowledge of this analyst, the idea was sold to him by a pack of IAS and IFS officers as the only way to hold India together under the guardianship of imperial Delhi.

The legislations will be on the statute book if they pass the Rajya Sabha. However, Rajiv Gandhi will find it far from easy to actually build the third-tier provided in the bills. If he is returned to power at the centre, Congress(I) chief ministers will take their time to implement the scheme, while the opposition-run state governments will do everything within their power to stall and change the legislations to their liking. It will not be surprising if Rajiv Gandhi's own government loses a great deal of enthusiasm for the power-to-the-people scheme once it were returned to power.

The rural masses have enough intimate knowledge of the Congress Party to expect of it any real transfer of power to their own hands. They will test the will and intentions of the ruling party before allowing their imagination to fly. The power-to-the-people slogan will not have a fraction of the impact the *garibi hatao* slogan had on the poor masses in 1969. Having seen the fate of that slogan, the village voters will refuse to dance to the pop music of power to the people.

The whole thing could have been accomplished with much greater effectiveness if the prime minister did not find himself desperately hustled by the need of an emotive electioneering slogan. He could have engaged the nation in a long, comprehensive debate in order to churn out a consensus. He did indeed engage in marathon discussions with different groups of people. But, the whole thing was an attempt to claim his personal authorship and ownership of the third-tier. Rajiv Gandhi's charge that the opposition chief ministers, with only two exceptions, kept out of discussions is only formally true; they kept out because he would not take them as true partners of a

grand design to give Indian democracy a third popular dimension.

Among the numerous faults of Rajiv Gandhi's political leadership nothing is as damaging to himself and to India as his apparent conviction that he and his party own the Indian state and nation. That's why his men in parliament can hurl the worst possible invectives at opposition members. That is why his political style has had the effect of undermining India's democratic institutions. There is unfortunately a crisis of confidence. How can one readily believe that the prime minister is rearing to take democracy to the frontier village when his government and his party cannot live with a CAG who dares to function as he is required to under the Constitution?

In a rare moment of candour, so much unlike Rajiv Gandhi after 1986, but so much like Rajiv Gandhi of 1985, the prime minister told a gathering of ad men in New Delhi on August 10 how his efforts to change the system came to nought. "When I tried to change the system, to push it to deliver, I came up against vested interests which just would not let go. Every time I thought I had identified the solution, I could not convince those at higher level, whether in politics or in the administration".

Elaborating on his failure, Rajiv Gandhi continued, "We worked at opening up the economy to involve more people in the development process...At every step, we found that there was somebody telling us that this was all wrong and shouldn't be done...and he had enough friends in the system to block it even if it went through the cabinet...and the parliament. At the real life level, it didn't work because people were not interested in allowing things to change."

These pathetic words reminded this writer of what one of the closest advisors to the prime minister told him in 1987, "The point is that we cannot get anything done through this machinery. Orders issued from PMO get lost 250 yards from this place."

Did Rajiv Gandhi expect the system respond to his innovative initiatives without resistance? Did he take the people into confidence with his initiatives? Did he, like Gorbachev, try to enlist the support of the people against the system, to change the system with the help of the people? Or did he withdraw into his cocoon and reverse to the beaten track of power, manipulation and secrecy? What makes him hope that the system will work out his People's Raj project without resistance?

The pathos of pathos, he turned to advertising men to take the image of his reforms to the people. Ad men to package Power to the People for sale at election time! To package the language of politics, so that the language can speak Rajiv Gandhi sweetly and convincingly to the people.

Calcutta Diary

AM

Article 368 of the Constitution is an open-ended invitation to a genuinely cynical government, such as the present one, to push through amendments which snuff out democratic functioning. Some of the latest political occurrences provide ominous pointers.

A NATIONAL constitution which permits itself to be mauled on sixty-five different occasions in the course of less than thirty-nine years must be *ipso facto* bad. The procedure for passing amendments, as laid down in Article 368 of our Constitution, is extraordinarily lax. The urge to amend this or that article, which for some reason inconveniences the authorities, is therefore difficult to resist. With elections decided according to the first-past-the-post principle, for a particular party to run up a two-thirds majority in the Lok Sabha is not that difficult. It may obtain such a majority even when barely one-third of the votes are cast in its favour. The problem is trickier in the case of the Rajya Sabha. But there is that provision of nominating eminent citizens as members. The ruling party has, in recent years, unabashedly chosen quite a few of its servitors to seat in the august second chamber: eminence, after all, depends on how you define it. Once the two-thirds majority has thus been contrived in both houses, the government is in a position to pass constitutional amendments almost at will. It is on only a few specific matters that the amendments also need ratification by one-half of the state legislatures. That is not much of a hurdle provided the two-thirds majority in parliament has been successfully arranged for. Since such balmy days might not last for ever, the regime could then be tempted to rush with a long list of amendments. The present regime has been so tempted.

But there is never a shortage of doubting Thomases. A two-thirds majority in parliament or no, it is not that easy for a government, it will be argued, to amend the Constitution in such a manner as would qualitatively transform the polity. Has not the Supreme Court, for one, refused to go along with any change in the Constitution's 'basic structure'? Which of the proposed changes constitutes or does not constitute a mutilation of the 'basic structure' is however also a matter for the Supreme Court ultimately to decide upon. By appointing judges who hold certain specific beliefs, the regime can always hope to 'manage' the decisions of the court. Franklin Delano Roosevelt showed how this can be done, if not with finesse, at least with a certain panache. We live in a non-genteel milieu. Most things are here done with a degree of crudity; the packing of courts too has assumed a more direct form. It is the outcome that counts. It will be altogether naive to assume that the judiciary as constituted at present will stand in the way of constitutional amendments however outrageous their nature. The judges are by now accustomed to play the role of the complaisant husband, the government, with its unending package of amendments, has succeeded in rendering the Constitution into a document which need no longer be taken seriously.

What is done, counsel the wise men, can also be undone. Well, not quite. True, the Thirty-ninth and the Forty-second Amendments, rushed through in 1975 and 1976 respectively, were followed close on their heels by the Forty-third and the Forty-fourth; most of the infamous clauses Indira Gandhi had inserted were taken out. Still, inertia is inertia, a few of the clauses remained, and at the end of that period of turmoil, the Indian Constitution became much more officious in its general bearing than it was earlier.

Article 368 in any event is an open-ended invitation, its use for non-zero sum pastime is patently unlikely. Once a genuinely cynical government, such as the current one, comes along, sooner or later it is bound to push through amendments which snuff out democratic functioning altogether. Consider, for example, some of the latest political occurrences. Spirits are running low in ruling party circles because of the report of the Comptroller and Auditor-General on the Bofors transactions and all that has happened in the aftermath. Suddenly, the party's electoral prospects appear to be rather dicey. But never say die, exciting ideas are again afloat. Surely there must be some stratagem whereby the elections could be postponed at least for some months and yet it would look as if the constitutional proprieties have not been breached. Never mind the withdrawal of the opposition, could not the present Lok Sabha itself meet for a brief session in the early part of January and pass a vote on account for the first few months of 1990-91? True, it would immediately cease to be. So what, since, according to the Constitution, six months can intervene between sessions of the Lok Sabha, once the vote on accounts is passed, the date of the Lok Sabha poll could be pushed back to somewhere as late as next June; meanwhile, hopefully, the electorate might be persuaded to forget the catty comments appended by that abominable creature, the CAG. Were a manoeuvre of this nature to be ruled out for whatever reason, since crisis time is crisis time, even more impatient suggestions could emerge from the wings. These could well include proposals of a breathtaking genre involving drastic amendments of the Constitution. The life of the Lok Sabha might be proposed to be extended from five to ten years. Or, fasten your seat belt, notwithstanding the other provisions of the Constitution, this being Jawaharlal Nehru's centenary year, an amendment could be introduced under Article 368 to the effect that no descendant of Nehru, once appointed as prime minister, be removed from that office until his death or unless he voluntarily abdicates. Did you say this is bizarre and full of flummery and could never happen? The Thirty-ninth

Amendment of the Constitution, passed with much eclat in September 1975, was however hardly any less bizarre; it forbade the standard legal processes which applied in the case of others, for challenging the election to the Lok Sabha of the incumbent prime minister and the incumbent speaker. Authoritarian proclivities have developed further in the course of the past dozen years; it need not any longer be considered as absurd that the Constitution should spell it out explicitly that this fief, India, owes its existence and survival exclusively to the Nehrus, the latter household must therefore have a permanent niche in the governance of this nation. Since the Lok Sabha has been rid of the opposition, and, with some fudging, it might be possible to contrive a two-thirds majority in the Rajya Sabha, an amendment of this nature might pass without much effort. It might not do too much damage to our reputation as the world's largest democracy either, for democracy is how Foggy Bottom and *Wall Street Journal* define it. We have, besides, done, over the past few years, so much damage to that reputation that this extra bit could even pass almost unnoticed.

But forget this depressing, what they call, scenario. Suppose elections to the Lok Sabha did actually take place according to schedule. It is likely to be a no-holds-barred poll, with thousands of crores of rupees invested to ensure a victory. Killings as much as booth capturing can be expected to take place on a large-scale. Consider however one situation that could emerge at the end of the gory exercise. The ruling party is beaten comprehensively in the south, fares equally badly in the east, loses in both Haryana and Delhi; its success in Maharashtra is neutralised by its reverses in Gujarat; the Hindi heartland however once more delivers, so that the regime just squeaks through with a bare majority. Or it does not even manage to do that. But since a Jakhar of a speaker can always interpret the Anti-Defection Law to suit the ruling party's interest, a number of those elected on the ticket of the opposition parties are bought over, so that the ruling party remains in power. A demoralised opposition then crumbles, and we are back to square one: the technology of the twenty-first century continues to be deployed to propagate the glory of medieval authoritarianism; even without a constitutional amendment, the Nehrus stay for ever, or so it would seem.

In terms of this scenario, the ruling party might obtain barely one-third of the total votes cast in the country, it might lose in as many as two-thirds of the states, it would still form the government at the centre. That is to say, as long as one or two key states continue to turn their face against the forces of progress and enlightenment, the rest of the country would have to go along. In the United Nations Security Council, a handful of major powers can exercise the veto whenever they dislike a particular move or resolution. A couple of states could begin to exercise a similar veto on the Indian destiny. Because these states would not move forward, the rest of the nation must also stay stuck in the milieu of the Middle Ages. Because these states would be held in thraldom by a particular dynasty, the rest of the nation must continue to put up with some of the most offensive rituals of sycophancy and obeisance. And, rest assured, in these circumstances the persons likely to come up as the government's principal decision-makers would continue to be bigoted, narrow-minded, and devoid of imagination. Having just pulled off a what-at-one-time-looked-to-be-patently-impossible electoral victory, they would also be haughty to the core. Such individuals are in all seasons incapable of seeing beyond their noses. To try to put it across to them that democracy is an emotional concordat, and that a formal majority in parliament might not mean much unless one also took into account the morphology of the majority, might be totally futile.

It could then be a Tripura-like situation, but on a magnified, national scale. In that eastern state, the Left Front obtained a clear majority of the popular votes in the last assembly elections, but failed to win—or was denied—a majority of the seats in the assembly. Tripura is a puny, little piece of real estate, hardly the size of a regular district. Should what was made to happen to her be repeated on a national scale, the reaction is however unlikely to be docile. Many unsavoury things might then occur. Questions might be raised, nagging, sullen, impatient questions, such that why must the people in the south, or Bengal, or Assam, or Punjab, or Haryana, agree to proceed in a particular direction, even when they knew in their heart of hearts that that could do them no good, merely because a couple of other states think that direction to be lovely? Why must they go along with the Indian army's misadventures in Sri Lanka when they realised in their heart of hearts that nothing could be a greater evil? Why must they put up, day after day, with the idiocy and insolence of Doordarshan and All India Radio? Why must they concur with the policy of officially organised orgy of murder and mayhem in Punjab and the consequent brutalisation of the Sikh youth? Or with the planned extermination of the landless in the northern and central states? Or with the sale of the national economy, lock, stock and barrel, to dishonest industrialists, fly-by-night operators, foreign banks and trans-national corporations? In other words, the social contract that is the Indian nation would be in danger of breaking down.

Even were one an atheist, one would be sorely tempted at this juncture to pray, to pray that good sense dawns upon those who are the ultimate purveyors of decisions within the portals of the ruling party, so that the Lok Sabha poll is allowed to be held on schedule. The atheist might also be equally tempted to pray that the party which has ruled over this nation, almost uninterruptedly, over the past forty years receives a comprehensive drubbing in that poll, for, as things now stand, only such a denouement could still save the polity.

But, then, an atheist is not normally given to praying; dark, tough days, lie ahead for the nation. Unless, of course, certain developments take place irrespective of the presence or absence of prayers, because the masses, in a sudden, nation-wide surge, decide that enough was enough, the crooks had a sufficiently long innings, this country now deserved better. That is, the people might choose to give themselves a break and side with what, sniggers notwithstanding, qualifies to be described as the historical process.

NEW DELHI

Liberalisation Road to Economic Ruination

B M

Expert opinion on the state of the economy and the government's economic policies is increasingly tending to converge and economists of different political and ideological persuasions now acknowledge the crisis situation building up on many fronts.

THE Indian economy is facing a serious crisis. This warning was sounded by some 40 distinguished economists at a meeting sponsored by the *Social Scientist* in New Delhi on August 7 and 8. Their opinion was, of course, in sharp contrast to the euphoria that the leaders of the government and official spokesmen and publicists have been trying hard to create about the state of the Indian economy and the progress that is claimed to have been made as a result of official policy and management under the leadership of the prime minister. The official side may indeed like to argue also, in order to blunt if they can the impact that the criticism by the experts may make on public opinion, that the economists who met in New Delhi were by and large of leftist persuasion and were not friendly to the present government and its leadership. This would not, however, be a wholly correct view of the New Delhi meeting of economists.

There were indeed significant divergences in their views and assessments of the state of the economy, the social forces at play in the economy, society and polity and the pressures and tensions that have to be reckoned with. There were some, for instance, who felt that it would be wrong not to take into account the new demands and sentiments of the middle classes in India who no longer are swayed by such patriotic slogans as 'buy Indian' regardless of quality. They felt that the television culture had indeed taken hold of large numbers in the country and this fact, disquieting though it may be, cannot simply be wished away. Then there were others, prominent among them L C Jain, who has just received the Magsaysay award for public service, taking seemingly a strong Gandhian stand (but actually inspired by the Mahalanobis model) on protection of handicrafts and village industries from the official policy of promoting indiscriminately and recklessly capital-intensive industries and production structures.

There were indeed many shades of opinions which were articulated by the economists in their meeting in New Delhi. But they were all agreed that the economy was not in good health and that the economic policy and management of the government was misconceived and harmful to the development of the economy in keeping with the needs of the mass of the people. They issued at the end of their meeting an agreed statement sharply critical of the government, refuting the claims of progress, pinpointing the weaknesses and distortions that the economy is suffering from and offering an alternative set of policies, beginning with "restoration of faith in planning, purposeful interventionism and public investment policies aimed at immediately reversing the present trends". In the short term, the statement emphasised, "import restrictions are a must to prevent further burgeoning of external and internal debt which has already touched unmanageable proportions". Further, till such time as demand can be managed in keeping with the potential of the economy, "the splurge in consumption by a few at the expense of the majority must be curbed".

The government and its publicists and propagandists will only be fooling themselves if they dismiss, as is their tendency, the sane and sound advice of such a large group of economists on the ground that they are not friendly to the government and do not occupy advisory positions in the present government set-up. The fact to be reckoned with by the government as much as by the people is that expert views about the state of the economy and the government's economic policies and management are tending now to converge.

This was demonstrated forcefully at a seminar at Jaipur on August 3 and 4 organised by the Jaipur Institute of Developments Studies on the external debt problem. The participants in the seminar were indeed a variegated lot, some of them holding official positions and some with even strong political sympathies for the ruling establishment. But they were no less distinguished as economists as those who met at New Delhi. The seminar was inaugurated by Sukhamoy Chakravarty, former member of the Planning Commission and at present chairman of the prime minister's economic advisory council. The keynote paper which held centre-stage at the deliberations was presented by Ajit Mazoomdar, a former secretary, planning and expenditure, in the union government.

What was remarkable about the discussions in the seminar was that starting with a meticulous exercise in determining the exact quantum of India's foreign debt and its composition, they extended to criticism of the liberalised economic policy of the government. The criticism was as trenchant and wide-ranging as that voiced by the later meeting of economists in New Delhi who declared that "the future of this country is being mortgaged and its economic sovereignty threatened". The position of Ajit Mazoomdar, which won near-unanimous support at the Jaipur seminar, was equally forthright in calling for a reversal of the present official policies. In his view, "if investment priorities and macro-economic (including fiscal) policies remain as in the last five years, the outcome will be a continuing increase in the current account deficit, accelerated foreign borrowing and a rise in the debt service ratio well over 30 per cent". He added, with his characteristic penchant for understatement, that "more than a new plan document will be required to reverse these trends". Sukhamoy Chakravarty, while declaring that there can be no general theory of borrowing had cautioned that the growth rate of foreign debt should be lower than the growth rate of the economy. He also drew attention to the rise of consumerism in society and of energy-intensity in production. Most significant was his warning that the drive for exports at all costs was no panacea either.

Participants in the Jaipur seminar were all agreed that the position in regard to external indebtedness was already alarming. The lone dissenter was an advisor of the Planning Commission who argued that the present level of foreign debt was 'of grave concern' but not 'alarming'. This feeble dissent was obviously inspired by his reluctance to admit that given the present official policies and the government's failure to mobilise domestic resources, playing around with a high growth target for the Eighth Plan would be dangerous and would amount to an exercise in recklessness and deception on the part of the planners as much as the government. It became obvious at Jaipur that the proposed 6 per cent growth target for the Eighth Plan, within the present economic policy regime, would gravely enhance the dependence of the Indian economy on foreign crutches with the inflow of foreign capital rising to more than 2.6 per cent of the GDP in contrast to 1.8 per cent of GDP at present. This is in contrast to the facile assumption of the planners that the foreign capital inflow can be scaled down to 1.6 per cent of GDP in the Eighth Plan. Given the persistence of the government with its present socio-economic policies and the projection of a 6 per cent and even higher growth target for the Eighth Plan, the country will surely be pushed into a foreign debt trap and will lose its economic, and eventually its

political, sovereignty. All healthy social forces and political formations have thus to be on guard and halt the drift to disaster which is under way under the present government.

It is indeed significant that what weighed most with the economists in both New Delhi and Jaipur is the danger before the country of getting caught in the foreign debt trap with all its grave consequences, economic, social and political. It is for the first time in recent years that economists with different social and political approaches and affiliations have raised their voice powerfully against the so-called liberalised economic policy and squarely blamed it for bringing the economy to the brink of disaster. Nobody takes the official figure of Rs 68,000 crore trotted out by the government in parliament as the true size of the country's foreign debt. At the Jaipur seminar careful calculations with the aid of RBI data showed that the foreign debt stood at over $60 billion, without taking into account debt incurred for defence imports and NRI deposits. The repayment liability on foreign debt already stands at about 30 per cent of India's foreign exchange earnings and is likely to rise further next year. No less disconcerting for economists of all shades is the fact that side by side with the rise in external debt there has been a relentless increase during the eighties in the internal debt because of the failure of the government to mobilise resources and control its expenditure. The result is that the prospect of growth of the economy as well as social equity stands blighted. The economists meeting in New Delhi rightly emphasised that official policy seeking to provide greater economic space for the private sector and foreign capital had sharply eroded the role of the planning process and the problems of unemployment, poverty, slow rates of growth and external vulnerability had been aggravated.

It is, however, remarkable that Rajiv Gandhi at the head of the present government, even as he has been engaged in recent months with an eye on the coming general elections with a great deal of populist gimmickry on a variety of issues, has not faltered in his commitment to the economic liberalisation policy and to an open economy. He has indeed been steadfast on these scores in spite of the deteriorating payments position and the rising external and internal debt. The acceleration of the rate of industrial growth is advanced by him and his publicists as the justification for the liberalisation policy comprising the removal of what are called unnecessary and unproductive regulatory controls, liberalised imports and wider opportunities for foreign investment. But economists have sounded the warning that while the acceleration of the rate of growth of new industries from a very low base, which finds a significant reflection in the new index of industrial production, may generate some euphoria about industrial growth in the short run, it does not amount to an upswing in the rate of industrial growth which can be sustained. The growth in the industrial sector has tended to be better in the case of industries engaged in the production of items of elitist interest, even as production of development inputs and essential goods of mass consumption has suffered big shortfalls. The new production capacities which have been set up have a very high import content. The idea that screw driver technology and a production structure based on heavy imports would enlarge and modernise some segments of industry and bring about a spurt in the growth of industrial production as a whole was misconceived to begin with and has been found to be unworkable in practice. If official spokesmen and some business circles like to gloat over the growth of the automobile industry, especially the sector catering to demand for private transport, as a 'pace-setter for industrial growth', and reliance is placed on the so-called 'sunrise industries', such as entertainment electronics, for boosting industrial growth, the fact has to be faced that industries producing essential consumption goods such as basic drugs and relatively cheap cloth and those producing development inputs such as steel and capital goods have remained stagnant. In the case of capital goods, which provide essential inputs for self-reliant and self-sustaining industrial growth, there has been a sharp slump. The prospects of industrial growth in the coming years can hardly be considered bright in the wake of these developments.

What has really happened under the liberalisation regime is that indigenous capacity and capability in the public and private sectors for undertaking the essential tasks of development of the economy have been emasculated. The ground is being prepared for handing over industrial and infrastructural development to foreign interests, which will necessarily rely for social and political support on the already powerful compradore political and business interests in India for operating in the Indian market. This is what further liberalisation and a more 'open economy' would add up to. The implications, economic, social and political, of these policy trends are indeed ominous.

The working of the Indian economy in response to official policy as brought out by the economists of different shades of opinion has an important bearing on the run-up to the general elections. The economists meeting in New Delhi emphasised as of the utmost importance the accountability and integrity of the government. They declared that "we are at present told too little by the government about economic realities and very important decisions, with major implications for the nation's future, are reached clandestinely. This must stop." Another issue of great importance that they forcefully raised was that of "greater degree of decentralisation of economic decision-making with an appropriate devolution of financial powers from the centre to the states and further to local bodies so as to further the process of development based on local resources and needs". They also emphasised the importance of land reforms accompained by co-operativisation and a guaranteed minimum wage for a "viable and vibrant agriculture".

Teaching Teachers a Lesson?

J V Deshpande

The Maharashtra government is clearly in the mood for a confrontation with college and university teachers. Unfortunately, the leadership of the teachers' movement in the state, trapped in the debris of recent ill-considered agitations, appears unlikely to be able to rise to the challenge.

THE start of the new academic year in Maharashtra in June has brought no cheer to the college and university teachers in the state. After two long-drawn and bitter strikes in the past two years, it looked in March-April that the pay and perk problems of the teachers, which have occupied so much of their energies for the past decade, will finally be settled at least for some time to come, so that the teachers and their leadership can turn their attention to the pressing educational problems on the campuses. But this has not happened.

College teachers in Maharashtra had joined the strike called by the all-India college teachers' body in 1987. It was only after a long strike that the governments agreed to implement the new salary grades for college and university teachers. A year later, late in 1988, when there was no further action on the issue by the state government in Maharashtra, teachers in the state had to resort to another indefinite strike. This was withdrawn only after extracting a firm commitment from the government that the relevant notification would be issued by the end of February 1989. However, teachers had to pay a price for this. They had to accept a marginally heavier workload; but more significantly, they also had to give up the protection on this point that they earlier had, in the form of an agreement signed in the high court in the seventies.

It was expected that after the government notification the new grades would be forthcoming within a few weeks. Much to the surprise of the college teachers, this has not happened. Six months after the notification, teachers are still waiting for the government and the university authorities to complete the 'administrative details'. Even now, it is not clear whether the teachers will start getting the new pay-packet in the next three months.

Even more surprising is the recent government decision to put—"for the time being"—every lecturer in the lowest of the three new grades open to them. As per the original decision, a college teacher could also get the senior or the selection grade in the new scales, depending upon his experience and qualifications. Now the teachers will be left to argue out their cases for the superior grades individually at a later date. This is being done ostensibly to expedite the implementation of the new grades. It is worthwhile to remember that no other state has found the administrative details of the transition to new grades as difficult and time-consuming as Maharashtra.

This has come as a bitter blow to rank and file college teachers in Maharashtra. What is more, apart from the non-payment of the new grades to the degree college teachers, several other steps clearly indicate that the state government, if not out to break the morale and the unity of the college teachers, is certainly bent upon driving a hard bargain with them.

In 1987 teachers in the degree and junior colleges had joined hands and gone on strike together—the former for the new grades and the latter for parity of pay with the degree college teachers. In fact, the strike was continued in Maharashtra for about three weeks more, after the settlement was reached at all-India level regarding the new scales of degree college teachers, in support of the demands of the junior college teachers. it had finally to be withdrawn without any satisfaction on the major demand of the junior college teachers.

The leadership of the college teachers' unions adopted a different mode of agitation in 1988. Even though, nominally, the teachers in both degree and junior colleges are part of the same union in Maharashtra, especially in Bombay, the strike action was launched only by teachers in the degree colleges and by a section of university teachers. At about the same time, the same leadership launched a separate agitation of teachers from the junior colleges, calling upon them to boycott the examination work connected with the two major state-wide examinations —the SSC and HSC Board's final examinations. This was for the separate charter of demands of the junior college teachers.

The response to the call for boycott was fair only in Bombay city, with the result that the HSC results from the entire state and the SSC results from all divisions except the Bombay division were declared more or less on time. Taken as a whole, not only was the call for the examinations boycott a failure but the teachers involved in it had other unpleasant surprises in store for them when they reassembled for the new academic year in June.

In Bombay, the teachers in junior colleges who had boycotted the examination work were not allowed to resume work. Although this order was withdrawn by the government after a few days, several thousand teachers in junior colleges have been refused salary for the vacation period on the ground that they had refused to help in the examination work. To add insult to injury, the government has arbitrarily reduced the number of days of leave available to a junior college teacher from 15 per year to 12. It is also likely that the student strength in many classes will increase from the already high figure of 80 to 120.

The inordinate delay by the state government in putting into effect the new pay-scales for degree college teachers and its deliberately provocative attitude towards the teachers of junior colleges should ordinarily have galvanised any active leadership into immediate protest action. That this has not happened is a sorry comment on the disarray that the teachers' movement finds itself in Maharashtra. The fact that the union is inactive even when a few thousands of its members are denied salary for two months or more shows the extent to which disillusionment has set in among the college teachers about the efficacy of their united actions in the past. Even a 'morcha' planned late in July had to be called off for want of support. Only recently, the government of Maharashtra has relented on the issue of vacation salaries, but not on account of any exertions on the part of the established leadership of the college teachers.

Several reasons can be cited for this sorry state of affairs. For over a decade now the college teachers' organisations in Maharashtra have been concentrating almost exclusively on the 'pay and perks' problems of their membership, totally neglecting the problems of basic educational reform. The same decade has also seen a precipitate decline in not only educational standards but even in the routine functioning of universities and colleges. The problems of teachers have ceased to be of much relevance to the rest of the community. In the recent strike and the boycott of examinations, the public was very clearly resentful of the teachers' actions. No agitation against the government can succeed without public sympathy, if not active support.

It has been argued in the past that in

the long run a meaningful united front of the teachers at all the stages of education can sustained only when such a front concerns itself with basic educational problems common at all levels. The events of the past two years have amply borne this out and now we see a union, ostensibly representing the teachers of both junior and degree colleges, reduced to launching two separate agitations for the two sections, for separate sets of demands. One may well wonder what is the purpose of having one union for both except perhaps to provide a solid vote-block for the leadership. It is noteworthy that when so many of the junior college teachers are facing a difficult financial situation, not even a relief fund has been started in degree colleges by the leadership. So much for fraternal camaraderie!

Apart from the total commitment to economism on the part of the leadership, there are other factors also which repel many persons, normally sympathetic to the teachers' movement. One of these is undoubtedly the mindless militancy of the present leadership group. It is now clear that the continuation of the strike in Maharashtra in 1987, when a settlement had been agreed to at the all-India level (by the same set of leaders) was nothing less than a blunder. It achieved nothing more and created sharp divisions in the fraternity of teachers. The same blunder was repeated at the state level in 1989 by the Bombay group, which insisted on continuing the boycott of examinations in the city even when the other units in Maharashtra had withdrawn it. Once again, without achieving anything, it created further serious dissensions, thus weakening the movement further. The result is that today, when action is needed most, the generals find themselves without an army.

With the state government clearly in a mood for a confrontation, it is all the more necessary for the teachers to close their ranks and work patiently and unitedly for solving the larger problems of education, which, *inter alia*, will also solve the problems of teachers in Maharashtra. This would require a great deal of patient work on part of the leadership to explain to the members the role of a responsible trade union movement in society not only for the economic betterment of the members but also for social upliftment. The present leadership, trapped as it is in its past firebrand rhetoric, is not expected to rise to the task. On the other hand, the way the affairs of trade unions are generally manipulated, it is also not expected that a new leadership with a broader vision will be able to emerge without a bitter struggle. All in all, the college teachers' movement in Maharashtra may be expected to remain in the doldrums for quite some time.

The State and Development Planning in India

As Indian planning approaches the end of its fourth decade, a sufficient time span now exists to allow an adequate consideration of its functioning and achievements over the longer term in relation to both the domestic and the foreign sectors. Within this perspective a recent conference organised by the School of Oriental and African Studies, London, explored the strengths and weaknesses of the planning process and experience in India. A report.

THE conference on "The State and Development Planning in India" organised by the School of Oriental and African Studies, University of London, from April 21 to 24 was not a part of Nehru's centenary celebrations but could easily have been the best tribute to the man. In exploring the strengths and weaknesses of the planning process and experience in India it underscored the uniqueness of that experience and offered critical and balanced perspectives on it. As Terry Byres, conference convenor and chairperson explained in his invitation to participants at the conference, "As Indian planning approaches the end of its fourth decade of operation, a sufficient time span now exists to allow an adequate consideration of its functioning and achievements over the longer term, in relation to both domestic and foreign sectors". Byres posed a set of questions offering a broad outline to the scope of the conference: "Are the supposed inefficiencies in resource allocation—in relation to both the internal and external spheres—as serious as some neo-classical economists make out? Are these, to the extent they exist, the inevitable concomitant of planning? Are they compensated for in terms of other criteria? Has planning generated a set of strategies which have been harmfully inward-looking? Would a more full-blooded espousal of market-oriented policies have achieved greater success? Has planning satisfactorily confronted the agrarian question? Has it produced a sound industrial base? Has it successfully mediated the town-country relationship? How has it impinged upon India's changing class structure, in town and country? Has planning secured the kind of structural change associated with successful economic transformation? Has the development of capitalism proceeded on a secure basis? Is the observed persistent poverty that which inexorably accompanies early capitalist development? Or could it have been markedly reduced with more effective planning? How has the planning process proceeded and developed in India? And with what result in terms of the mechanics of planning? What have been the major features of the institutional evolution of the Planning Commission? And what the determinants of that evolution? Is the nature of the Indian state such as to facilitate or impede successful development planning?" Unfortunately, though understandably, the papers presented at the conference did not answer all these questions. Nevertheless they offer a comprehensive and fairly balanced critique of Indian planning.

I
Historical Context

The historical context for planning in India came up for brief enquiry in at least two papers, those of Meghnad Desai and Utsa Patnaik (see appendix for full list of papers). Both located the role given to the state in development planning in the context of late industrialisation in a post-colonial economy confronted with the legacy of de-industrialisation and drain of surplus. Desai argued that "the pre-independence analysis of the root cause of India's underdevelopment was partial and flawed. It emphasised the imperial seizure of the economic surplus (the drain) rather than analysed the size of the economic surplus. It underplayed the issues of production and presumed that upon transfer of power and halt of drain, a correct allocation of the surplus to the appropriate sectors would solve the problem of Indian industrialisation." Thus the faith in planning and state intervention at the time of independence and its preoccupation with allocational issues neglecting productivity and the need to increase the overall size of surplus. Further, by viewing the problem in agriculture in largely institutional terms the early planners neglected the need to increase agricultural productivity and fell prey to the "neglect of agricultural growth as a *prerequisite* of industrialisation in the then prevalent theories of growth". He saw agricultural growth under the stimulus of the green revolution as having occurred independently of the planning process as an "exogenous shock" which has allowed capitalism to take over as the dominant mode in the countryside. "This transformation occurred outside the Mahalanobis perspective. The Planning Commission did play its part as it happened but did not initiate this change. Its focus was principally on industrial transformation. The bigger structural change in the Indian economy came independently of planning, outside its framework. What is more, this change undermined the presumption that plannin[g] would be an instrument for bringin[g] socialism to the country."

Utsa Patnaik cited various estimates (in[-]cluding her own) of the "drain of surplus" and questioned Desai's contention that th[e] absolute size of the surplus was either smal[l] or shrinking. More importantly, Utsa Patnai[k] argued, it was the legacy of colonialism i[n] India which necessitated state interven[-]tionism and planning as pre-conditions fo[r] economic development. What was thi[s] legacy? As Patnaik summed it up, "We se[e] several closely inter-related and inter[-]dependent phenomena emerging from the 1820s onwards which persist until the 1930s: de-industrialisation and de-urbanisation of India accompanied by industrialisation and urbanisation in Britain; the transfer of a portion of the Indian taxation revenues to Britain entailing a continuous excess of domestic investment over domestic savings in Britain; the realisation of this transfer through a continuously maintained merchandise export surplus from India with, on the obverse, a continuously maintained merchandise import surplus into Britain; and finally commercialisation of agriculture following the drive to expand the production of exportables in India (essential for realising the transfer) in the form of primary commodities entering as raw materials and wage goods into expanding industrial production in metropolises." In this context she saw the achievements of Indian planning as stemming from the "recognition that the unrestricted operation of market forces and openness of the economy in an ex-colonial country, given a world still dominated by predatory international capital, would only perpetuate industrial backwardness". Given the legacy of imperialism it was correctly seen that state intervention was essential to the strategy of independent, albeit capitalist, industrialisation in a post-colonial economy.

The discussion during the session focused upon the concept of economic surplus as it came up in Desai's paper and the relationship between the size of economic surplus and its mode of utilisation. The discussant for Desai's paper, Amit Bhaduri, said that in the Indian case, the Mahalanobis model assumed a fixed real wage, as is usual in surplus-maximising models of growth, while it was in fact a questionable assumption. If real wages are downward flexible then the size of the surplus was not as rigidly determined as the model had supposed. On the other hand, he suggested, one reason for the assumption of downward rigidity of the real wage in India may have been India's relatively high sensitivity to inflation, which in itself requires an explanation.

II
Political Dimension

A paper that directly addressed itself to the political role of planning in India was that by Partha Chaterjee. He examined the question of how the assertion of the "technical discipline" of planning can become an

instrument of politics. In late-colonial India, the Congress Party's, and Nehru's, attitudes to planning was not only a part of the anticipation of power by the leadership of the Congress, it was also an anticipation of the concrete forms in which that power would be exercised within a national state. More specifically, planning was used to legitimise the requirements of capital and the debate on the need for industrialisation was politically resolved by successfully constituting planning as a domain outside the "squabbles and conflicts of politics". According to Chaterjee, "A developmental ideology then was a constituent part of the self-definition of the post-colonial state. The state was connected to the people-nation not simply through the procedural forms of representative government, it also acquired its representativeness by directing a programme of economic development on behalf of the nation."

Rejecting the dichotomy between "planning in theory" and "planning in practice" and the claim that it is in implementation that planning has failed rather than in conceptualisation and formulation of the appropriate strategy, the paper sees a dialectical relationship between the two suggesting that the "failure" of planning is directly linked to the political logic of the "passive revolution" (*a la* Gramsci) which sought to promote industrialisation without taking the risk of agrarian political mobilisation. This was an essential aspect of the hegemonic construct of the post-colonial state: combining accumulation with legitimation while avoiding the 'unnecessary rigours' of social conflict. To quote Chaterjee, "While the planner thinks of his own practice as an instrument for resolving conflict, the political process uses planning itself as an instrument for producing consent for capital's passive revolution."

In his response the discussant, Gautam Sen, argued that while politicians have short-term objectives involving their immediate political survival the "autonomous Planner" is supposed to have the long-term objective in view with no personal stake in the short term. This was however not possible because while planning was intended to "legitimise" certain political processes, it is the politicisation of planning which has in fact made economic issues like planning a political phenomena. In the discussion that followed the following points came up: In any analysis of the post-colonial state it is important to capture the role of imperialism and the anti-imperialist content of state policy. State intervention in post-colonial societies, while obviously serving the interests of the dominant class, often had an anti-imperialist dimension which should not be neglected. It was asked if planning in a "strategic" sense had actually been replaced by short-term "crisis-management" given its inability to cope with interest group lobbying and political bargaining. Was planning in India ever anything more than a process facilitating accumulation for and legitimisation of capitalist development? Even if this was so, it was asked, had either of these functions been adequately performed? Finally, it was suggested, it is wrong to view planning in such a uni-dimensional way since the bourgeoisie had after all not accepted planning in its entirety and at least some part of the legacy of planning, especially of the First, Second and Third Plan periods, had become matters of contention between conflicting political tendencies. After all, planning had created a space for non-capitalist and non-market forms of economic activity which are difficult to wish away in contemporary India.

Some of these themes were taken up in Ajit Mazoomdar's paper which offered a useful and comprehensive overview of planning in India. It drew attention to the fact that the "national consensus" which had existed for planning in early post-independence years had yielded to increasing divergence in attitudes towards the planning process in general and the planning machinery within the government in particular. He emphasised the need for a wider historical perspective in current attitudes to planning in India and drew attention to the political philosophy underlying the concept of planning in India. Mazoomdar regretted the increasingly "party political" character of five-year plans and offered suggestions for strengthening the machinery of planning with greater decentralisation.

In his remarks the discussant, Jan Breman, contested the view that planning could be an apolitical, technical exercise and did not find it surprising that it was in fact partly political. It is the mistake of economists to view planning as a technical exercise and this was due to the fact that planning was seen as the domain of the "technocratic economist" rather than that of a "social scientist". Economics is inherently an "interventionist" discipline, unlike the other social sciences, and believes in the "makeability of the social fabric—that it can somehow be manufactured and shaped through state intervention". In this sense, post-independence planning in India was a continuation of the apolitical style of bureaucratic interventionism of the colonial period. In the ensuing discussion the following points were made: that the problem of planning in India was not one of technical capabilities of the system and its functionaries but had to do with the nature and levels of decision-making which was too bureaucratic and centralised; that the planning process has been diluted from one of long-term strategic planning to (a) arbitrating over inter-state resource transfers and allocations; and (b) overseeing inter-departmental conflicts in allocation of public resources; that planning at the macro-level was discredited by failures of the control system at the micro-level; that "planning" as much as "non-planning or liberalisation" were equally "political or ideological" categories and that it was wrong to see the case for a market economy as a non-ideological one; finally, it was argued that while planning and state intervention may be "inefficient" in economic terms they tend to be socially or politically "efficient" in the sense that they try to promote social harmony and reduce inequalities. The shift from a planned to a free market system may promote growth and efficiency but this would be at the cost of increased economic inequality and social conflict. The choice for any society would have to be between such alternatives.

Another dimension of the politics of planning examined in the paper by Sukhamoy Chakravarty (a chapter from his book on development planning in India which was introduced by Sanjaya Baru in the author's absence) was the dichotomy which is seen to exist between planning in theory and planning in practice. A simplistic way of viewing this dichotomy is in terms of the neglect of the "feasibility" of plans. Chakravarty suggests that a "good plan must minimally attempt a proper appraisal of the feasibility of what it normatively postulates". A second interpretation of this dichotomy would be in terms of the level of aggregation involved in macro-economic planning and its inability to influence the very large number of actors involved in implementation of plans. One possible explanation for this failure is that plan models have been improperly specified, in the sense that they have failed to capture the true state of underlying structural relationships. The paper considers other explanations as well like "information failure". Considering such distortions, is the solution to be found in the free operation of market forces and the price mechanism? Chakravarty is sceptical of this alternative and votes in favour of more effective planning. While it is true that state intervention has given rise to directly unproductive rent-seeking activity, Chakravarty does not believe that an open-trading market system can provide the needed set of signals, especially in the area of technological change, for a developing economy. After listing out the kind of reforms that need to be undertaken to make planning more effective the paper draws attention to the "fiscal crisis" in the Indian public economy and the need for a major attempt at resource mobilisation on a national scale as a pre-condition to any attempt at reinstating the importance of the planning process within the economy as a whole.

The discussant, David Taylor, while conceding the failure of a market mechanism in tackling the problems of a developing economy, was not sure if planning had all the answers. Indeed, despite planning inter-regional and inter-class inequalities do not seem to have reduced in India. In the discussion the problem of information availability and the quality of the available information came in for close scrutiny. The declining quality of data in India was attributed to an increasing "deafness" in the bureaucratic and political system which was not interested in generating the required information

because it was not willing to "listen" to what this information had to say. The availability of information is not independent of its utilisation and the political consequences thereof.

III

Agriculture

Trends in Indian agriculture were examined in papers by Krishna Bharadwaj, J Mohan Rao, Utsa Patnaik and Ravi Srivastava. Mohan Rao provided an overview of developments in Indian agriculture and the role of government policy. Not only was there little "strategic planning" in agriculture during the first three plans but there was unwarranted "rural optimism" and the government exhibited a peculiar non-interventionism, especially in the area of agrarian reform, which was not so evident in the industrial sector. While industry was subject to more regulation and planning, agriculture was left largely on its own till the green revolution strategy was adopted. This has been one of the major areas of failure for Indian planning and while famines have been avoided and the long-term rate of growth of foodgrain production has been pushed up above the pre-independence level, India has failed to increase per capita food consumption on a sustained basis. Rising food prices along with rising income inequalities have contributed to this. "Government interventions in the food market have, especially in recent decades, favoured the well-to-do net sellers of food and worked against the interests of the mass of the net food buyers, both rural and urban."

In his comments the discussant, James Boyce, built up a case for "democratic" as opposed to "technocratic" solutions for India's agrarian sector. Other reactions included disagreement with the author on his observations on trends in income inequality and its link with growth. It was also suggested that the "rural-urban" dichotomy was increasingly losing its significance both in the capital and labour markets with greater integration occurring as a result of the widening and deepening of capitalism in the economy.

The second part of Utsa Patnaik's paper was devoted to an analysis of agrarian change in India in the recent period. In her view, "the major failure [of planning] is embodied in the historic compromise reached by the Indian capitalist class with the landlords, in which any effective and radical land redistribution was shelved . . . It is this failure to break the monopoly of productive resources in a few hands which has determined the character of capitalist investment in agriculture and the consequent perpetuation of unemployment and poverty for the majority of the rural population". Given the historical legacy of colonialism in India a rational strategy of growth, in her view, "demands measures to expand rapidly employment and, therefore, the mass *internal market* for capital", and both early planners like Mahalanobis and contemporary policy-makers are accused of having failed to understand the importance of the unemployment problem and the strategy of development required to tackle it in a large ex-colony like India. The legacy of the strategy pursued thus far was summed up in several tables which present data on trends in unemployment, land ownership, food production and consumption, shares of wages and property-incomes in NDP and inter-regional inequalities in the agricultural sector. Finally, the paper presents a set of "rational" policy alternatives aimed at generating employment and redistributing income and assets. Short of land redistribution the only alternative was the formation of co-operative organisations of the rural poor. The author also builds a case for co-operative utilisation of rural resources from an ecological point of view.

In his detailed comments on the paper Michael Lipton agreed with the broad thrust of Patnaik's policy recommendations but was sceptical about her analysis of the statistical trends. Her conclusions were not "wrong statements but over-statements" which, in his view, exaggerated the negative impact of colonialism and of the role of "institutions" in the agricultural sector neglecting the role of "technical factors". Lipton believed that land reforms were still feasible in India provided the urban economy was willing to bear the burden of compensation for farmers financed by higher taxation of urban incomes. In the discussion it was pointed out that any experiment with rural co-operatives could succeed only if it was supported by a strong peasant and agricultural labour movement; otherwise such institutions would be dominated by the existing vested interests.

Krishna Bharadwaj's paper offered an analysis of agricultural price policy within the overall context of agricultural planning and the emerging inter-regional, inter-sectoral and inter-class conflicts in India. Prices are not simply manipulable variables since they are thrown up by a specific structure of production and exchange relations. Any planning or policy-making body which seeks to set prices that do not reflect these underlying forces will only be frustrated in its effort of effecting changes in income, production and consumption profiles. "Given the diversity of production conditions and relations as well as the geophysical and natural resource positions of various regions and the differences in technical advances in production methods of various crops, as well as the diverse pace of commercialisation of regions, or of crops and of producers, prices are formed reflecting this diversity of conditions . . ." While price policy has been an important component of agricultural policy in India it has not always succeeded in meeting the stated objectives because the policy framework has not come to terms with the extant structure of production and exchange which have often distorted the transmission of price and non-price signals in the economy.

The discussant, Ajit Ghosh, pointed out that agricultural price policy became an important aspect of official policy only in the mid-sixties, with the initiation of the green revolution strategy, and was never an important instrument of planning up to then. Indeed, at a time when the government began fixing agricultural prices macro-economic planning was itself in a crisis and early planners, including Mahalanobis, had neglected the role of agricultural prices and inter-sectoral terms of trade in macro-economic planning. The policy of setting agricultural prices, it was pointed out in the discussion, had only helped to stabilise fluctuations and had not helped in determining the absolute price level which was determined by institutional factors rather than by the policy framework.

In a well-documented and interesting analysis of uneven spatial development Ravi Srivastava examined the record of one of the major goals of macro-economic planning in India, namely, to reduce inter-regional inequalities. The paper brings out the inability of government policy to counter the impact of historical and contemporary institutional and demographic factors in shaping the nature of spatial development in India. In Srivastava's view "the planning process and the public investment strategies have played an important role in making the 'feasibility' of a certain change relatively more widespread. But the range of this opportunity itself varies from region to region. Moreover, whether certain classes reorient their strategies also depends crucially on the pre-existing modes of surplus appropriation" and other factors such as demographic changes and class formation in agriculture. The paper finds disparities in agricultural growth more marked than in industrial growth and these disparities have in fact widened over time. Significantly, regions with a greater proportion of middle-level households in agriculture with weaker landlord domination are shown to exhibit stronger growth tendencies. In summing up his analysis Srivastava is struck by the fact that "forty years into planning, the pattern of growth should still bear a substantial correspondence with the historical location of relatively more dynamic class formations," and is sceptical about the possibility of the "trickle-down" effects of uneven capitalist development reducing this spatial imbalance.

The discussant, Biplab Dasgupta, wanted greater attention paid to the role of state

policy, especially in the agricultural sector, in explaining inter-regional variations in growth. In the discussion it was suggested that the picture of inter-regional growth can be altered depending on how one classifies the data and alternative hypotheses can be supported by a regrouping of the same information.

IV

Industry

The session on industry discussed papers by Amiya Bagchi and Isher Ahluwalia. Bagchi's paper on the public sector in India postulated that one way to approach the macro-economic and macro-social setting of public enterprises in Indian industry is to look upon them as an answer, not the answer, to the problem of private investment failure. That is, "the inability of private merchants and industrialists to invest on an adequate scale in projects that have long gestation lags, require high levels of initial finance, and durable contracts with other supplying or consuming enterprises for them to be viable in the long run". In current debates on the public sector the "strategic" role of the sector is not often recognised by its critics. Bagchi argued that an important component of the lobby in favour of privatisation would be the non-resident Indians and foreign businesses who would like to see India's external indebtedness increase as a means of weakening the relatively autonomous basis of industrial growth in India. Having said this, it must be conceded that the overall record of the public sector, despite several and important exceptions, has not been a good one especially in the area of technology transfer, adaptation and development. The chain of "dynamic adaptability" of technology, from innovation or import to further innovation or adaptive upgradation and so on, has been broken at all possible points even in the case of the public sector, not to mention the private sector, accounting at least partly for its poor track record. Finally, Bagchi argued, the solution to the problems besetting the public sector cannot be purely managerial since many of its problems are political and social.

The discussant, Nigel Crook, emphasised the need to focus more clearly on the "changing relationship" between the public and private sectors. The "hidden agenda" of the public sector has been (a) to bear some of the "social costs" of industrialisation, and (b) to protect or promote employment in the economy. While the public sector has served the former objective it has failed to do so in the latter case and in the more recent period employment in the public sector had ceased to grow. In the discussion it was asked how one could explain public sector inefficiency (high costs of production) if it was in fact required to subsidise the creation of assets for the private sector. One way of explaining this obvious paradox was to argue that over time the public sector and its employees have acquired a relative autonomy within the system and they are increasing their share of the cake through rent-seeking. The political importance of the middle class, or of "intermediate regimes" (*a la* Kalecki), and their ability to demand higher wages and salaries could explain this and also the problem that capital faces in "privatising" the public sector. Part of the reason for the public sector entering into certain lines of activity, it was suggested, had to do with inter-corporate (or inter-business house) rivalry in India whereby rather than concede a licence to a rival business house the public sector was asked to invest.

Isher Ahluwalia's paper provided an overview of the strengths and weaknesses of the strategy of industrialisation pursued in India and the contribution of planning. She argued that the early five-year plans, including the Second Plan, had not built a case for protection based on the "infant-industry" thesis; consequently protection was blanket and this combined with export-pessimism of the early planners had created an insular and inefficient industry. In his response the discussant M R Bagavan suggested that export-pessimism in the 1950s could easily be explained given (a) the absence of any historical experience, at the time, of export-led growth in the third world (this was to occur only in the 1960s and 1970s); and (b) the strong influence of the success (at the time) of Soviet industrialisation experience. The thesis of "export-pessimism" may be relevant for the sixties or seventies but clearly not for the fifties, and yet after the foreign exchange crisis there was hardly any export-pessimism among policy-makers. If Indian exports did not increase during this period it was not due to policy blinkers but due to the strong lure of the domestic market in almost all commodities which India could have exported. He saw the need to distinguish between the government's "fiscal crisis" and an overall "resources crisis", the latter did not exist in India and the former was largely of the government's own making. Finally, Bagavan drew attention to major structural changes in Indian industry and said that while Indian industry had built up an impressive manufacturing capacity it had not succeeded in creating the requisite design capacity and here the impact of import and investment liberalisation in recent years could only be deleterious to the long-term interests of the industrial economy.

V

Foreign Trade, Aid and Investment

This session discussed papers by Deepak Nayyar, Nirmal Chandra and Pramit Chaudhuri. Deepak Nayyar's paper examined the role of the foreign trade sector in the wider context of planning for industrialisation in India, the interaction between the macro-economy and the foreign trade sector, and provided a simple analytical framework of the macro-economy of the external sector. Nayyar illustrated the nexus between exports and investment at the macro-level thus, "Exports provide an external market on the demand side and enforce a cost discipline on the supply side, whereas investment creates a domestic market on the demand side and transforms the industrial structure on the supply side. Hence, there is a possible cumulative causation that arises from the interaction between the effects of the foreign trade multiplier and of capacity creation combined with industrial cost-efficiency. On the demand side, high investment and high exports together induce market expansion and may be conducive to high growth. On the supply side, a high or rising proportion of investment in GDP may provide flexibility through more rapid supply-side adjustment, while a high or rising proportion of exports in GDP may provide discipline by enforcing cost-efficiency. Such a virtuous circle of cumulative macro-economic causation would be associated with a rapid growth in GDP, industrial output and manufactured exports."

"In large countries such as India", Nayyar summed up, "where the domestic market is overwhelmingly important, sustained industrialisation can only be based on the growth of the internal market. On the other hand, in small countries the possibilities of industrialisation may be limited by the size of the domestic market. In the ultimate analysis, large economies must seek to externalise internal markets whereas small economies must endeavour to internalise external markets. Therefore, industrialisation may stress manufacturing for the domestic market through import-substitution or manufacturing for exports to external markets. The emphasis, as also the quantitative and qualitative significance of the foreign trade sector, would depend on the size of the economy and the stage of its development. Unfortunately, this basic issue has often been reduced to a debate about trade policies for industrialisation or the choice between import-substitution and export-promotion."

In his response the discussant, V Bhaskar, questioned the view that import-liberalisation would induce efficiency and bring dynamic gains in the long run even if it meant that short-term costs would have to be incurred. The effect of trade on the economy would depend on the internal structure of the economy. If the domestic market is small and economies of scale are high then exports can help in achieving scale efficiency but this would be at the cost of exposure to the world market. Hence, there are both costs and benefits attached to a strategy of growth based on the external market. In the ensuing discussion the following points were made: that no general theory of the relationship between external trade and macro-economic growth can be constructed; that price-competitiveness was not adequate in judging the ability to export given the importance of a variety of non-price barriers to trade ranging from marketing ability and product quality specifications

to political and non-tariff barriers; that the concept of the "size of the internal market" was nebulous; and that any attempt at trade liberalisation should not be made when the internal economy was not otherwise sound since this could result in increasing external indebtedness and domestic inflation. This point came up for greater discussion in the last session.

Pramit Chaudhuri, in his survey of the contribution of foreign aid to India's development strategy, drew attention to the former's quantitative insignificance and its marginal role in influencing the objectives of planning. Foreign aid did give the government of India added economic power by placing at its disposal a key resource which was neither available to state governments nor to the private sector. On the other hand, despite its quantitative insignificance it did have the effect of blunting the radical stance adopted by the government in the early years of planning. Foreign aid had, however, no positive impact on any of the major goals of Indian plans, namely, achieving self-reliance, poverty removal and the establishment of a "socialistic pattern of society", though it has helped in crisis-management from time to time or in promoting special programmes like Operation Flood.

The discussant, Deepak Lal, saw the role of foreign aid as one of "bailing out" the planners from the problems created by the inefficiencies of the control system and preserving the "interest group equilibrium" that rent-seeking had given rise to. In the current context he saw little prospect for any increase in foreign aid to India so that the government, rather than being "bailed out", would have to resort to either of the two solutions to meet the extant economic situation: (a) reduce government expenditure, or (b) remove controls and unleash supply-side effects. Lal believed both were difficult options and so the government was being forced to borrow heavily abroad and thereby "mask the fiscal crisis". Increasing foreign borrowing, Lal suggested, was an "early signal of things to come", which in his view was a "Latin American type situation of hyper-inflation". A "positive" outcome of such a situation, in Lal's view, would be that the impending economic crisis would force politicians to take "necessary measures to fight the vested interests and break the interest group equilibrium". Rather than opt for this "reckless alternative" the government would be saner in opting for reduced external borrowing and fiscal deflation at home.

In the discussion that followed there emerged an interesting consensus across a wide theoretical spectrum on the dangers inherent to the current policy of the union government of resorting to heavy external borrowing along with import and foreign investment liberalisation at a time when inflationary pressures were relatively strong and the government's fiscal scenario was far from stable. There was disagreement on Lal's characterisation of the alternatives. India did not require a Latin American style hyper-inflation for political crisis to set in given the higher sensitivity to inflation here. Further, the kind of crisis outlined by Lal need not necessarily end up with the breaking up of the so-called "interest group equilibrium", rather, it could force such groups to close ranks and resort to more "authoritarian" forms of political control aimed at securing their share of the surplus.

Nirmal Chandra's paper probed the relative importance of foreign capital in the private corporate sector in India, the performance of foreign firms and the implications of recent changes in policy toward foreign capital. The paper documents the poor record of foreign firms both in import-substitution and in export-promotion and contrasts the Indian experience with the Japanese. It concludes, "If the Japanese story has a moral for India, it is that India's striving for an indigenous technological base cannot succeed without a long phase of purposive planning and protection against foreign goods, technology and direct investment." In his comments the discussant, V N Balasubramaniam, argued that India had a "love-hate" relationship with foreign capital and that the choice between "repatriation" and "reinvestment" of profits was not an easy one. Repatriation raised protests of capital outflow while re-investment raised fears of increased control of productive capacity. Drawing attention to increased Indian investment abroad he wondered why Indian firms seemed to perform better abroad than in India, had it to do with the burden of the control regime at home? In the ensuing discussion it was pointed out that the question of access to technology was central to any debate on foreign capital. Foreign investment was not bad in itself but it was the terms on which it came that were questionable.

VI

Macro-Economic Framework

Papers dealing with the macro-economic framework of Indian planning, by Prabhat Patnaik, Ashwani Saith, Vijay Joshi and I M D Little, confined themselves largely to an analysis of the Mahalanobis model and to a critique of recent policy changes. Prabhat Patnaik offered a critical examination of the Mahalanobis strategy arguing that it did not take cognisance of the fact that the production structure and the structure of income distribution, in any economy, are interlinked. In Patnaik's view, the trajectory of development in the Indian economy suggests that the naturally reinforcing changes in each of these structures have pushed the economy in a direction where its labour reserves may never get used up perpetuating widespread un- and under-employment. Mahalanobis' conception of the Indian economy, it is argued, had not only overlooked the possibility of such cumulative movements, by assuming, what Patnaik terms, "fiscal omnipotence" on the part of an absolutely autonomous and benevolent state, but had also assumed that the production structure would be rigid against the pulls of a demand structure thrown up by an income distribution structure generated and sustained by the former. In Patnaik's view the political economy discussion in India had committed a similar mistake as the technocratic view had done by postulating a one-way causation running from the income-distribution side to the production structure, with the former seen as independent of the latter and assuming "fiscal impotence" of the state *vis-a-vis* the propertied classes. Given domestic income and asset inequalities and an international demonstration effect an economy like India is bound to face pent-up demand for luxuries (a constant demand for "new goods") which would force the production structure to be moulded by the structure of demand. Given technological rigidities in the production of such goods, the capital and import intensities of production, a labour surplus economy like India is bound to be stuck with the problems of massive unemployment.

In his comments the discussant, S K Rao, noted that the outcome of the model was dependent on two assumptions: (a) that the production of "new goods" was a capital-intensive process and that additional employment created in this process was high-wage employment generating further demand for "new goods"; and (b) that the technology required for the production of these goods is constantly changing, necessitating continued imports. If such "new goods" could be manufactured with labour-intensive and domestically generated technologies then it would still be possible to solve the problem of unemployment even if the structure of income distribution had not significantly altered. Further, the model was seen to rest on the assumption that the technological gap between India and the developed countries, producing these "new goods" was not being bridged. In Rao's view, an important factor that influenced the demand for "new goods" was the structure of agricultural production. If land concentration was high and marketed surplus was generated by a small number of affluent farmers then the agrarian sector's demand for "industrial new goods" would be greater than if the agrarian sector was more egalitarian generating a pattern of consumption in which the demand for "new goods" was lower. In short, the smaller the number of farms and farmers from which the marketed surplus had to be extracted, the larger the volume of "new goods" that would have to be offered in exchange for this surplus. Rao also wanted the dynamics of the model to be linked to the problem of external indebtedness which had emerged as a major by-product of the present economic policy regime in India. In the discussion the following points were made: the process of industrial development in India has been such that on the demand side, income distribution has been distorting the pattern of consumption as assumed in the Mahalanobis model, and on the supply side, the lack of indigenous technological capability to meet this demand was forcing the country to im-

port the required technology and goods. Thus the capital-intensity of production in India was not simply a product of government policies, as often alleged, but of the extant structure of income-distribution and the consequent demand pattern. Parallels between the Indian and Brazilian experience (dubbed as the inequalising spiral strategy) were also drawn.

Ashwani Saith examined various critiques of the Mahalanobis model in relation to its treatment of distributional issues. Unlike in Gandhian and Maoist strategies of development where labour-intensive rural technologies are viewed statically and as alternative technologies, Mahalanobis saw them as a component part of modern industrialisation in a labour-abundant economy. The employment that heavy industry strategy could not provide was to be generated by rural, small-scale industries in this model. If this did not actually occur the fault was not with the model but lay with the political system—there was not enough political pressure in favour of rural industries or poverty-alleviation programmes as there was, for instance, in favour of the public sector. Saith thus believed the Mahalanobis strategy did not really take off because only one half of the strategy was implemented, creation of the heavy industrial base, and the other half, rural industrialisation, was not.

The discusant, Pranabh Bardhan, argued that all policy modelling on poverty was done in a political vacuum since no government has in fact been committed to a serious programme of poverty-eradication. He dwelt at length on the shortcomings of NSS data on consumption in estimating inequalities and suggested that given the under-representation of the rich in NSS consumption expenditure surveys, the under-estimation of inequality was in fact increasing over time. Consequently, inter-temporal studies understate the increase in inequality. Further, he presented a strong case in favour of combining different variables, like demographic data, and different methodologies, like macro-level statistical exercises with micro-level anthropological studies, to provide more realistic estimates and analysis of poverty in India.

While Vijay Joshi and I M D Little tabled a paper already published in *EPW*, they made an impromptu presentation of ongoing work on macro-economic trends in India. This is part of a 17-country study and Little brought out the contrasts between India's record and that of other countries. Indian macro-economic policy was seen as the most "conservative" of the 17 countries in as much as it allowed for the lowest rate of inflation, a tight monetary policy and had a good record on external debt. In the long-term, however, India's record was poorer in terms of GDP and export growth in comparison with ASEAN, Brazil and Mexico. Little also provided estimates that suggested a weak, if absent, link between public and private investment in India contradicting a widely held view on this relationship. Joshi's survey of macro-economic policy handling during different episodes of "crisis" in the economy (1965-66, 1973-74 and 1978-79) showed changing attitudes towards inflation with the government willing to allow higher rates of inflation to prevail instead of administering the monetarist squeeze. In contrast to "muddled" responses to crisis in the mid-sixties Joshi saw more maturity in later periods. Nevertheless, the Indian record was vastly different from that of most third world countries and it was not clear why India had such a low toleration level for inflation.

In his comments the discussant, John Toye, saw the Indian experience as being touted in defence of monetarism. He also emphasised that thus far it appeared that the benefits of controls seem to have outweighed the costs and that the timing of liberalisation was important since it could have different repercussions at different times given the internal and external economic environment. He saw the paper giving far too much importance to Indian bureaucracy in macroeconomic policy formulation and crisis-management and ignoring the role of the political leadership. In the discussion it was pointed out that better crisis management in the late-1970s, as opposed to the mid-sixties, was more on account of fortuitous developments like an increased inflow of foreign exchange remittances and improved external trade and payments trends, rather than due to policy reasons. The paper's analysis of inflation was seen as too monetarist, not taking account of the role of institutional factors, such as administered price increases, in inducing inflationary pressures. While India's record on growth may have been worse than other countries on a long-term basis it was important to remember that its ability to absorb external shocks and handle crises in the world economy was better largely on account of the policy of self-reliance pursued in the past. In his response, Joshi conceded that it is dangerous for any country to liberalise externally when the government is losing control on public finances and was building up a huge deficit and a debt burden, as was in fact the case with India currently.

VII

Summing Up

The conference concluded with a summing up of themes by Amit Bhaduri and Pranab Bardhan. Bhaduri drew attention to the manner in which the discussion repeatedly threw up the question regarding what constituted endogenous and exogenous variables in economics. This figured in three specific areas: information, investment and terms of trade. Was "information" exogenous to the economic system or endogenous to it (a manipulable variable)? Unless one is clear about the nature of the information one was using a lot of empirical analysis would be faulted. Further, mainstream (neo-classical) economic theory had not yet found a way of analysing the transition process from one state of equilibrium to another. So when one was analysing economies in transition (transitions in policy regimes, production and trade regimes, structures of proportionality between sectors, and so on) it was still not clear how to handle the problems of transition within these methodologies.

Pranab Bardhan was struck by the repeated conflict that seems to come up in the studies on India between the findings of macro- and micro-level enquiries. How does one reconcile the two? He argued in favour of a coming together of disciplines, the need for economists to use the tools of the anthropologist in arriving at a deeper understanding of the processes of change. He emphasised the need for incorporating trends in the political and social arena into economic analysis and outlined a list of areas in which economists could do more work.

A view was expressed that the conference had neglected to look at the impact of planning on the position of workers, in urban and rural areas, on women, tribals and the environment. Terry Byres will edit a volume of these conference papers and the book should be available next year.

Appendix: List of Papers

Ahluwalia, Isher J: Contribution of Planning to Indian Industrialisation.

Bagchi, A K: Public Enterprises in Indian Industry: A Macro- and Meso-level Analysis.

Bharadwaj, Krishna: Agricultural Prices Policy for Growth—Emerging Contradictions.

Chakravarty, Sukhamoy: Problems of Plan Implementation.

Chandra, Nirmal: Planning and Foreign Investment in India.

Chaterjee, Partha: Development Planning and the Indian State.

Chaudhuri, Pramit: Foreign Aid and the Planners in India.

Desai, Meghnad: Indian Planning—Techniques, Perspectives and Context.

Joshi, Vijay and Little, I M D: Indian Macro-Economic Policies.

Mohan Rao, J: Agricultural Growth and Planning's Contribution.

Mazoomdar, Ajit: (i) The Rise and Decline of Development Planning in India; (ii) The Political Economy of Indian Planning—A Note.

Nayyar, Deepak: The Foreign Trade Sector—Planning and Industrialisation in India.

Patnaik, Prabhat: Critical Reflections on Some Aspects of Structural Change in the Indian Economy.

Patnaik, Utsa: India's Agricultural Development in the Light of Historical Experience.

Saith, Ashwani: From Mahalanobis' Fourth Sector to Indira Gandhi's 'Garibi Hatao'—The Treatment of the Distributional Dimension in Indian Planning.

Srivastava, Ravi: Planning and Regional Disparities in India.

Stabilising International Commodity Prices
Too Little Too Late?

Satish Jha

The Common Fund for Commodities, first proposed in 1974, has at last been ratified by the required number of countries. However, the fear is widely shared that the Fund has come into existence a decade too late and a billion dollars too short in terms of the funds at its disposal.

IT has taken fifteen years to find a seat for the Common Fund for Commodities. This July the first governing body meeting of the Fund at Geneva decided to locate its offices at Amsterdam in Netherlands and appointed Budi Hartantyo of Indonesia (a former Dutch colony) its first chief executive. But considering that the Common Fund is the only concrete symbol of the idea of a new international economic order and should have meant a great deal for the developing countries, its birth was a rather quiet affair. Moreover, the process of giving it the final touches has left a few questions about its functioning and the future.

Amsterdam had to be chosen for its office in preference to Brussels even though the latter came up with a far more generous offer than Holland, offering office space virtually free of cost for ever compared to Netherlands' concession of free office for six years only. Secondly, a compromise had to be made in choosing its chief executive in favour of a country which belongs to OPEC and has led the negotiations for the Common Fund since the beginning, leaving aside a somewhat more suited candidate from India who had led the Common Fund cell in UNCTAD earlier this decade and was thought to have an edge over his competitors for the job. India did reach the third and final round of election only to get about a quarter of the votes. What is worse though is the virtually forced appointment of the candidate from Denmark as one of the three senior staff members of the Fund after he had been defeated in the first round itself. His biodata circulated at the time of election does not show any financial or commercial expertise that he may need to help run the Fund. This when the Scandinavian countries were in the forefront of the negotiation process leading to the founding of the Fund. Moreover, all the developed countries had been asserting all along that professionalism must not be compromised. This leaves the Fund with little continuity or the necessary first-rate professionalism so badly needed to make it a success. The governing body also failed to appoint two of its twenty-eight executive directors because those electing were not very familiar with the rules, thus leaving the developed countries with more votes in the executive committee than the developing ones even though it is supposed to be a body created to help the developing countries.

To top it all, the member countries, rather than work out the ways to make the Fund an effective instrument to achieve its set objectives, are worrying about whether the deadline for paying in the pledged capital should be Friday of the third week of August or Monday? Reliable sources expect up to 15 member countries defaulting in paying the pledged subscription. These points have left some of those concerned about the Funds' future a little despondent. In any case, for now the first account dealing with the buffer-stocking operations is unlikely to be an active account. In the beginning greater emphasis is going to be placed on the second account that will help find out how poor countries can improve their commodities and processing. The Fund itself is much smaller than it was originally expected to be. Rather than beginning with a capital of $ 1 billion proposed more than a decade back it is starting with half as much a decade later. It has taken so long to start that the initial enthusiasm for it has waned. Even UNCTAD does not seem too upbeat about it. The recent collapse of coffee prices, the experience of tin in particular and OPEC in general and the state of commodity markets in general have left little room for optimism. Still the Common Fund of Commodities is a reality. It may be interesting to look at how it was brought about.

As things stand now the Fund is going to function with $ 315 million of capital and about $ 230 million of voluntary contributions to the second account. It will function with Budi Hartantyo as the managing director and Henrik Skouenborg, a Danish foreign service officer, as chief of operations. Two more senior officers are to be appointed by Hartantyo with a budget of $ 0.5 million for salaries, etc. All countries are supposed to pay up their pledged contributions by August 18 and the managing director should assume charge by mid-September. Only two international commodity agreements based on buffer-stocking principle—rubber and cocoa—are to join the Fund to begin with. However, there are doubts as to how much can be achieved by such a small secretariat with such a small kitty. But some of the senior negotiators associated with the Fund's formation argue that while its capital is smaller, it will also be handling fewer commodities than were expected originally. Moreover, right now the second account involving research and development, quality and productivity improvment and market development will be the more active one. Still doubts persist due to the novelty of the experiment and those chosen to lead it failing to inspire enough confidence. However, what is seen by many close observers of the Common Fund negotiations is the fact that the Fund is there at last.

First proposed in 1974 under United Nations General Assembly resolution 3202 (S-VI) calling for an integrated programme for commodities and discussed in UNCTAD papers through the next year it was adopted at the UNCTAD meeting in Nairobi in 1976. Its protagonists trace the idea of a Common Fund back to Keynes who first proposed an international institution for regulating world commodity markets in 1942. A quarter century later the second UNCTAD meeting at New Delhi considered setting up a Central Commodity Stabilisation Fund. But the first proposal to establish a Common Fund was mooted formally by UNCTAD on December 12, 1974 following the UN resolution 3202. In the background was the overall failure of the commodity procedures to have international agreements to stabilise the prices or establishing floor prices. In the three decades following the birth of the UN system only a few international commodity agreements (ICAs) with economic provisions were concluded. Some of these pertained to wheat, sugar, tin, coffee, etc. Even UNCTAD could not do much better managing to have only one agreement by 1975—the International Cocoa Agreement.

It was then thought by the UNCTAD secretariat, which was supposed to be functioning as the secretariat of the developing countries as well, that buffer-stock financing was the major stumbling block in concluding ICAs. Therefore

availability of necessary finance for buffer-stocking could be an effective way of intervening in the international commodity market while serving the goals of UN resolution 3202. So the Common Fund was thought of as a way of financing individual commodity organisations' purchase and stocking of commodities whenever prices fell below a certain level and sale when prices turned favourable or for intervening in the market with similar intent. As the situation improved and stocks could be sold the loans would be paid back to the Fund. Spreading its role over more than one commodity could spread the risk, offer a possibility of profits and generally stabilise and/or improve prices. For the same reasons it was also seen as a more workable idea than a single commodity fund.

So originally the Common Fund was supposed to finance ten core commodities mainly exported by the developing countries. These included sugar, cocoa, coffee, tea, rubber, cotton, jute, hard fibres, copper and tin, two-thirds of whose exports originated in developing countries. Eventually other commodities could have come under the wings of the Fund. Original calculations for buffer-stocking the 10 commodities were estimated at \$ 5 billion and including 'non-core' commodities \$ 6 billion was supposed to be sufficient to launch the Fund effectively. However, initially the Fund was to start functioning with only \$ 1 billion as paid-up capital and \$ 2 billion to be generated from loans. The other half of the estimated \$ 6 billion was to be needed and generated later in the same fashion.

The required equity was to be generated by country subscriptions on the basis of an agreed set of criteria that were to include the benefit accuring to the country, GNP, per capita income and its share in the world commodity trade. Loans were to come from governments, international financial institutions and the capital market. For this it was necessary to make the Fund a financially viable institution. This was also the time when OPEC had come to acquire surplus funds. It was expected that in the name of solidarity OPEC would come up with substantial concessional loans, etc.

Once the idea had been spelt out, it was followed by a long drawn-out negotiation process with the governments and their delegations, presiding officers of the conference and its various committees and the UNCTAD secretariat as the principal actors. Negotiations were conducted according to the group system prevailing in UNCTAD—the Group of 77, Group B (OECD countries), Group D (East block) and China. Some innovations were also made in this negotiation process. Generally the chair-personship of the Group of 77 in Geneva rotates every three months. But to provide continuity to the Fund negotiations the group decided to establish a permanent group of 33 countries, with 11 coming from each region. Indonesia's Ali Alatas was elected the first chairman of this permanent negotiating group and though he had to leave the chair to take up a ministerial assignment in his country and a nominee of Philippines replaced him, he continued to be the main negotiator and spokesman. Later, to make the group even more compact, a committee of six was founded and was then expanded to include six more countries. Even this group was chaired by the chairman of the Group of 33. However, in the name of transparency any country could participate in the deliberations of either group.

The main negotiations, however, took place between the Group of 77—with Group D and China declaring their agreement with the idea—and Group B which was led by the French ambassador to the UN in Geneva. This did not reduce the internal conflicts though. Group of 77 was not a homogeneous group with Africa on the one hand and ASEAN and Latin American commodity exporters on the other. The autonomy of the existing ICAs also had to be defended. Moreover, some of the G 77 countries were also importers of these commodities. Within the Group B as well there were major differences—among the US, the hard core opponent of the idea, the UK which was divided between its ideology, short-term interests as a major commodity importer and the burden of meeting the pressure of the Commonwealth countries, and the Nordic countries which were generally sympathetic to the cause of the G 77.

The major difference, however, could be seen in the composition of the negotiating groups from G 77 and G B with the latter coming from technical ministries while the majority of the developing countries were represented by their lay diplomats. Group B also had the advantage of a competent secretariat in OECD while G 77 could bank on the help of UNCTAD which, unlike OECD, had to appear to be less than wholly partisan. Besides, at the pre-negotiation stage the US sent Henry Kissinger himself to kill the idea of a Common Fund and instead propose an alternative idea of International Resources Bank (IRB) with an initial capital of \$ 1 billion, to guarantee against political risks that may be associated with investments to produce commodities. West Germany proposed stabilising earnings rather than prices and the French suggested the idea of ex-post pooling. These differences continued from the pre-negotiation stage to the agreement being signed and after. The US, though a signatory to the agreement, is not a party to the Fund as it did not send the agreement for ratification by the US Congress.

The major differences were on the concept itself, with the G 77 pressing for prior finance and Group B favouring the concept of pooling, and within the G 77 disagreements on the method of assessing the contribution, commodity coverage and how the ICA and the Fund were to relate. Also, most developing countries could not agree to subscribe to the Fund's capital significantly as their commodities were not covered by ICAs and it was seen as a transfer from one developing country to another. All these differences led to a compromise position which allowed for some pooling as capital of the fund was to be increased by the association of ICAs by direct subscription of guarantee capital from the country-members of ICAs. The second account of the Fund was also a result of efforts to give it a broader appeal, including to the countries which did not have exportable commodities belonging to the existing ICAs.

It was not before the 1980 UNCTAD that an informal agreement was reached and voluntary pledges were invited for the second account. It took nearly a year to draft the Articles of Agreement and on June 27, 1980 the agreement was finally adopted by consensus establishing the Common Fund for Commodities.

However, it has taken these countries nearly twice as long to make the agreement effective by 90 countries accounting for two-thirds of the capital ratifying it. It is suggested by those closely associated with the negotiations on the Fund that after the collapse of oil prices many countries were not as enthusiastic about the Fund. Abdelaziz Megzari, the senior advisor to the Common Fund in UNCTAD, argues that ratification was a problem because developing countries mostly sent diplomats to the negotiations while ratification involves technical departments as well. Some others see a coincidence between the change of leadership at UNCTAD, its decline and the Fund being relegated to the background. A senior negotiator argues that UNCTAD virtually lost interest in Common Fund to the extent that while addressing the Group of 77 in 1987 at Havana the UNCTAD secretary general did not even refer to the Fund while president Mitterrand of France was enthusiastic about the Fund. Some others, having successfully negotiated it, would like to see it function well but are far from optimistic about it. It would seem as though the Fund is born a decade too late with a billion dollars too short.

Trends of Change in Indian Society since Independence

A R Desai

The trends of social change in India in the last forty years can be understood properly only if they are seen as a consequence of the specific path of development pursued by the rulers.

RAJIV GANDHI and his (ever changing) team are proclaiming, through their massive and expanding TV and radio network that during the remaining 15 years of the 20th century a face-lift will be given to Indjan society by ushering in changes of a far-reaching nature through economic policies, technological thrusts, educational and cultural programmes as well as by making governance clean and efficient. This promise of a face-lift is described as ushering Indian society, within a decade and half, into a computer-laser-age founded on high productivity and efficient and clean management.

The Rajiv regime has also proclaimed that it is generating specific trends of change in Indian society by making drastic alterations in the ethos of the Seventh and the subsequent Five-Year Plans. It has announced that to accelerate high technology production, transport and services and to lift the productivity of Indian economy, polity, education and administration to qualitatively higher planes far-reaching measures are being adopted in various fields. Similarly, it also promises that with a view to removing the poverty of the vast mass of Indian people living below the miserably low poverty-line accepted by the rulers, a poverty-removal programme is being launched to counteract the after-effects of the policies pursued up to now which have generated grave problems in terms of widening the gap between the beneficiaries of the plans and those who are more and more adversely affected by their operations.

With a view to stimulating an 'optimistic', 'forward looking' and 'cheerful' atmosphere and a mood permeated with the scientific temper among the people, Rajiv Gandhi has launched a highly expensive series of festivals and cultural extravaganzas both in India and abroad—in France, the US, West Germany, Russia, Japan, etc. Also, spectacular displays to mark 'Forty Years of Freedom' in the form of torch-processions by film stars, sports heroes and others, culminating with Rajiv Gandhi and his wife heading the spectacle.

Similarly, with a view to evoking Indian—i e, upper caste Hindu—pride and appealing to their spiritual ethos, massive displays extolling what is described as 'our great spiritual heritage' are undertaken. These take the form of publicising temples, religious festivals and melas, pujas and yagnas and holding exhibitions of art, dance and sculpture-architecture. This propaganda is now being carried out on a scale which transcends all such endeavours even by the late Indira Gandhi.

More than four years passed since the Rajiv regime began to introduce various programmes to prepare Indian society for a take-off to prosperity in the 21st century. The Seventh Plan has completed four years of its operation and a mid-term appraisal of the plan was undertaken. Preparation for the Eighth Plan is under way. However, the mid-term appraisal of the Seventh Plan, conducted officially, does not confirm the rosy picture of the inauguration of a march towards efficient, more productive, equitable and socially just socio-economic and politico-cultural development publicised by the Rajiv regime.

The four years of the Rajiv regime and its programmes in different spheres have hardly been, even according to official and other appraisals, path-breaking as proclaimed by the rulers. Instead they reveal merely a continuance of the basic alarming trends generated by the policies adopted by earlier regimes since independence. In fact they reveal that the programmes espoused by Rajiv regime have, in a short period of three or four years, accelerated these alarming trends. The measures adopted by the Rajiv regime have exhibited their pro-rich, pro-propertied, anti-poor and anti-toiler orientations more openly and more ruthlessly than those of the earlier regimes.

With a view to properly assessing the transformation that is taking place under the Rajiv regime it is necessary at the outset to grasp the fact that the Rajiv regime is pursuing with greater tenacity (as suited to the changed circumstances) the path followed by the rulers since independence, viz, the capitalist path of development. This path was chalked out in the Constitution as well as in the plans and policies of the government right from independence. The trends of change in Indian society and the profile of Indian society that is being contoured can be grasped in their essential features only if we trace them basically to the capitalist path of development pursued by the rulers.

I have pointed in several of my studies with evidence from the Constitution (with all the modifications in it since its formulation), from the principles guiding planning, from the operation of the economic, educational, politico-administrative and legal-judicial measures adopted by the rulers that they have from the inception of independence, in fact from the process of framing the Constitution, chosen the capitalist path of development. I emphasise the need to realise that the path pursued is capitalist for a number of reasons.

First, it alone helps us to make a clear formulation of the type of socio-economic formation which is being evolved from 1947 and which continues during Rajiv regime. Second, it is necessary to grasp that the path pursued is capitalist because both the rulers and the overwhelming section of the intelligentsia still try to propagate the myth that Indian development is attempted to be moulded on non-capitalist lines or some variant of the socialistic or the Gandhian pattern. Third, the rulers as well as their ideologues comprising administrators, policy-makers and a majority of academics and researchers create a myth that the Indian state is a supra-class welfare agency operating as or capable of operating as a gigantic funnel which endeavours or is capable of endeavouring to transfer resources and purchasing power from the higher to the lower income and the no income groups in society, even though it operates within the matrix of production for the market and for profit relying on the proprietary classes as crucial agents of growth and development. Fourth, the rulers and the ideologues supporting the path pursued by the rulers want to hide the basic fact that resource-generation and allocation by planning is contoured by the major premise of the development strategy—that the private owners of the means of production are to be treated as the major agents of growth and development and that only within the limits of class inequality implicit in this can the state endeavour to redistribute income to the non-owning classes. The state is encouraging the acquisition of the lion's share of resources both extant and to be generated by the property-owning classes. This is done by permitting them to augment their wealth through interest, rents and profits or through gigantic direct and indirect assistance given by the state in the form of loans, subsidies, tax concessions and administered prices or by the state shouldering the responsibility of providing expensive infrastructural facilities, of making available inputs and of ensuring markets for final products. Finally, refusal to recognise that the path pursued by India since independence is the capitalist path helps the rulers and their intellectual supporters to create an illusion of all-round progress and development through the massive and expanding media for communication and propaganda. The limited luxury and armament led growth strategy adopted

since the beginning of the eighties and pursued with greater zeal and opennes during the years of the Rajiv regime is sought to be depicted as beneficial to all sections of society and is likely to lead to poverty removal and upliftment of the vast sections of the toiling poor.

A few incisive scholars have pointed out the basic features of this luxury and armament led growth strategy. This strategy involves the state providing enormous facilities to the private sector by adopting what is called the liberalisation policy as well as by actively cutting out a small enclave provided with more purchasing power and inducements to purchase luxury goods produced by the private sector. The provision of purchasing power to this special enclave is achieved by adopting measures like raising salaries and perquisites of selected strata engaged in services, trade and manufacturing, by schemes of tax exemption and tax reductions, by policies of public borrowing at enticingly high rates of interest, by pumping sizeable amount of public money via loans at subsidised interest rates to promote markets for luxury goods. Some sensitive observers have also pointed out how this armament and luxury led growth strategy, by pumping purchasing power into a limited enclave, is leading the state into a deficit trap with large foreign and internal borrowings and other categories of financial liabilities, on which the payment of interest and repayment of principal is becoming almost an unresolvable dilemma confronting the rulers.

I have emphasised the need to recognise the path of development pursued by the rulers as the capitalist path because during last forty years certain crucial, consistent trends of change in Indian society are taking place which cannot be explained in any other terms. Nor can one explain the process of social transformation generated since independence.

All of us are aware that the objective of the rulers of independent India has been to transform the poor, backward and underdeveloped social order left by the British rulers into a prosperous, independent, developed modern society based on technologically efficient industrial, agrarian and service sectors. The path adopted to realise this objective has been 'planning'. We already have the experience of a series of plans with their erratic unfoldment. The first three five-year plans were followed by three years of plan holiday which were followed by the Fourth Plan and a stormy Fifth Plan. We then witnessed the shortened Sixth Plan formulated by the Janata regime, characterised as the Rolling Plan, and the reformulation by the Indira regime of the Sixth Plan. We have also experienced the operation of the Seventh Plan with its proclaimed new thrust to generate social processes which will prepare the Indian people for the technological modernisation of the economy and society as they enter the 21st century.

Every five-year plan has been commended in different flamboyant terms. Some were hailed as plans to evolve the socialistic pattern of society. Some were described as instruments for ushering in 'growth with social justice'. At a later stage they were considered effective instruments for 'garibhi hatao'. In the short post-emergency spell of Janata rule it was proclaimed that the five-year plan being evolved by that regime would usher in a society based on the Gandhian principle of Sarvodaya, a path considered to be different from the Nehruite concept of development. The subsequent plans formulated under the Indira regime and modified during the Rajiv regime have been characterised as plans to develop a strong and independent India with 'garibhi hatao' as one of the main planks. Subsequently the emphasis shifted in favour of a liberal dispensation in terms of providing open incentives and facilities to the private sector and streamlining and cutting to size the public sector to make for efficient productive profit-earning and technological modernisation. In spite of the high-sounding goals proclaimed by the rulers for the various plans, the overall trends of social transformation which in spite of minor zigzags reveal a certain constancy during the last forty years. From mid-seventies and particularly during the eighties and much more during the last four years of the Rajiv Gandhi regime, these social processes and trends of social transformations have been accelerating at an alarming pace.

These social trends can be broadly summed up as follows:

(1) India has remained one of the poorest countries in the world both in terms of GNP and per capita income, even after forty years of development.

(2) Within this overall picture, the inequalities of wealth and income distribution are increasing. Gradual enrichment of the capitalist class comprising industrial, commercial and financial groups; a segment of the rural rich comprising of landlords operating in a new setting, kulaks and rich farmers; and a section of the higher echelons of professionals and employees connected with the rapidly expanding service sector. B V Krishnamurti described this sector as the 'U sector'.

(3) Further, within this sector, keen competition to capture markets and gain control of government facilities and assistance is resulting in further asset and income concentration in the hands of smaller and smaller groups. As pointed out earlier, this process of asset and income concentration has been accelerated by the new policies adopted by the Rajiv regime which has been rightly described as armament, defence and luxury led growth.

(4) The state faced with greater and greater difficulties in mobilising resources in the context of its policy of assisting the rich tends to use a variety of measures to throw greater burdens on the common people. This is done for pumping out more resources to be placed at the service of the newly emerging propertied classes considered as agents of growth and development. Deficit financing, increasing resort to borrowings, both internal and external, greater and greater reliance on indirect taxation, making public sector facilities more and more costly and economising by lowering the quality and quantity of public sector products and services are some of the important measures adopted by the state pursuing the capitalist path of development.

(5) One of the significant trends generated of late is the result of a policy deliberately adopted to transform and streamline the organised sector in the name of efficiency, higher productivity, and greater profit. This policy is resulting in a sizeable segment of industrial and service units falling sick or closing down. This causes tragic social consequences. Thousands and lakhs of workers lose their jobs or now work under conditions wherein their security benefits and other perquisites and facilities are set aside. Workers and employees affected by such measures are placed in a situation where they are underpaid, over-exploited and forced to work under insecure, unprotected and hazardous conditions at their work places. These insecure, unprotected conditions of work are glorified by the government as the income-generating, labour-absorbing 'informal' sector.

This shift from secure, stable and legally protected work in the organised sector to the proliferating informal sector has, as brought out by a number of studies, had a very devastating impact on women, dalits, the tribal populations, petty craftsmen, agricultural workers and other segments of the poor and propertyless population.

The operators of the informal sector, including the government, use the helplessness of the employees to foment caste, communal, linguistic and gender tensions in the course of selectively employing them or providing loans or other facilities. The emergence of a chain of contractors, middlemen, musclemen as well as other categories of intermediaries to recruit, regulate, discipline and even terrorise the employees who demand some relief or attempt to unionise is another important social process with the expansion of the informal sector.

(6) Another trend generated, particularly after the completion of the Second Plan, is to make the public sector increasingly subservient to the 'U sector', helping to strengthen and augment its economic, political, social and ideological hold over society.

(7) The number of the unemployed and the under-employed reaching staggering dimensions is another social trend which has developed since independence, particularly after the Second Plan. The growth of the unemployed and the under-employed and its differential impact on different castes and linguistic, regional and religious groups and on adivasis and women is generating fierce competition among these groups and sections within these groups. This has resulted

in a social process of ever increasing violent internecine clashes for procuring minimal survival needs as well as for securing limited jobs and services. The employing classes utilise the situation to promote various types of organised and unorganised criminal processes for their gains and to keep these strata divided and increasingly prone to internecine struggles. The accentuation of unemployment and under-employment reveals how the path pursued by the rulers—development by 'betting on the rich'—is unable to utilise the vast human resources available and crying to be used productively and for economically gainful purposes.

(8) Another process generated since independence and continuing is the process of pauperisation and proletarianisation of the vast majority of the population.

(9) The above mentioned processes, in the context of the rapidly growing market and money matrix, have trapped more and more people in the coils of the market which are being elaborated systematically by the rulers pursuing the capitalist path. This market net comprises a bizarre and corrupt network of ration shops, fair price shops, open markets and black markets. This complex and corrupt constellation operates as a strangulating noose around the vast mass of common humanity, hurling them into an eddy of insecurity and forcing them to indulge in various illegal and criminal activities even for bare survival as human beings.

This constellation also provides an excellent venue to reap enormous gains and illegal earnings at various levels by suppliers of commodities and services, generating an unholy complex of profiteers and the law-enforcing authorities, breeding corruption and illegality all the way from the smallest market unit to the national and international commercial and trade complexes.

This social trend is becoming stronger and more widespread with the passage of time as plans based on pursuit of the capitalist path have unfolded themselves in the last forty years. During the four years of the Rajiv regime, against the background of its liberal policy of supporting the private sector and its emphasis on industrialisation based on capital-intensive sophisticated technology, this social trend has been aggravating at an alarming rate with its frightening consequences in terms of prices soaring higher, corruption growing at exponential rate and inflationary trends acquiring an unprecedented tempo.

(10) The policies pursued to develop and modernise society by adopting the capitalist path, against the background of a labour surplus situation, are resulting in deterioration of the condition of the overwhelming majority of women, scheduled castes and scheduled tribes. They have also resulted in the acceleration of regional disparities.

(11) Another trend which is acquiring alarming proportions is the corrupt liaison between the political machinery, business and the emerging lumpen strata in society. This liaison has assumed such brazen forms that the political, economic and socio-cultural processes themselves have become highly criminalised, authoritarian and corrupt.

(12) The vast mass of workers, peasants and other categories of the exploited, oppressed and poor people who made immense sacrifices and contributed substantially to the anti-imperialist struggle expected that freedom would at least ensure them security of jobs, adequate purchasing power in the ever-expanding market-economy, availability of essentials necessary for dignified existence, provision of minimum needs in the form of education and medical facilities and removal of caste, communal, ethnic, class, gender and linguistic discrimination, exploitation and oppression. They expected to have more active participation in vital affairs concerning the Indian people. The consequences of government policies, based on the pursuit of the capitalist path, slowly generated a sense of disillusionment and discontent among the people. The illusion of growth resulting in trickling down of benefits to the poor was getting shattered. The discontent acquired greater poignancy and articulation after the mid-sixties. The decade of the seventies intensified the feeling of discontent and disillusionment and became a decade of growing protests and struggles by the exploited, petty proprietary and non-proprietary classes, both in the urban and rural areas. The decade of the eighties has almost turned into an epoch of explosive outbursts with the struggles of the people acquiring massive dimensions and taking resort to more and more militant forms.

The rulers are resorting to increasing use of extraordinary anti-democratic laws and are launching repression of a more and more brutal nature. This is mainly to contain and suppress the accelerating protest movements and crush the organisations spearheading and building up such movements, even if they be for very elementary demands like access to jobs, security of services, humane conditions of work in work places, cheaper and hygienic shelters and medical facilities, supply of at least the basic wage-goods at reasonable and fixed prices and universal and free education and other means of acquiring knowledge. In fact the state is itself actively involved in the non-implementation of laws already passed, like those dealing with untouchability, the prohibition of exploitation of child labour, minimum wages and protection of women. The rulers are increasingly resorting to the perfidious practice of sponsoring and supporting trends which would generate internecine conflicts among the oppressed to prevent the masses from being unified for their main struggles. As pointed out by Upendra Baxi in his *Crisis of Indian Legal System*, the rulers are the most significant violators of laws enacted in the country. They are resorting to massive operations to suppress the movements of the people in the name of maintaining 'law and order' and counteracting the forces which, according to them, are threatening national integration. From 1968 a spate of repressive legislation in the form of draconic ordinances and enactments have been resorted to by the rulers. Similarly, more and more ruthless and complex forms of repressive operations in the form of arrests and detention without trial, increasing atrocities by the police, the semi-military police formations and even the army itself, including resort to murders masked as 'encounter deaths'. These repressive operations have been highlighted by democratic rights organisations, by a number of fact-finding committees as well as a growing body of reports and accounts of the organisations conducting the struggles of the people.

During the last four years of the Rajiv regime this anti-democratic and authoritarian trend of repression has gathered momentum, threatening to transform the last decade of the 20th century into a decade of explosive struggles by different strata of Indian poor on the one hand and emergence of a highly authoritarian, criminalised, corrupt and pro-propertied regime on the other. This will place the people under an iron fist couched in a velvet glove of promises of a take-off to a prosperous, modern society into which the Indian people would supposedly enter with the beginning of the 21st century.

The trends of social change in the last forty years indicated above can be grasped properly only if they are understood as a consequence of the specific path of development pursued by the rulers. Genuine improvement in the condition of the toiling people and their active participation are possible only if endeavours are made to generate and assist social processes which would break the shackles of the present capitalist path being pursued by the rulers of India.

External Resources and Self-Reliant Growth

Arun Ghosh

Foreign Money in India by B P Mathur; Macmillan India, 1989; pp 281, Rs 120.

B P MATHUR exemplifies the rare breed of civil servants capable of independent thinking and sustained scholarly analysis; additionally, he has demonstrated the strength of character required to pursue research investigations and studies in the face of enormous practical difficulties and at considerable personal cost.

The subject he has chosen is a controversial one, for he has dared to take up cudgels against the accepted theory of development, against the extant policies and philosophy of the government of India, against the superficially obvious advantage of external finance for bridging the gap between the needs of domestic investment and the availability of domestic saving so as to speed up the growth of the economy. And having reached the conclusion that external finance—in the manner it is available—is detrimental to the long-term interest of the recipient country, having had the benefit of observing why this happens as a player in the game within the government, he has shown enormous tenacity of purpose in piecing together all available data to prove his point that foreign funds, in the form and manner available to developing countries, help only to sustain the exports of the capital exporting countries to the detriment of the recipient countries. And even though some of his conclusions are not backed by data but only by logic, he has hit up on a cardinal truth—that self-reliance calls for the mobilisation of internal effort and resources for which there is no substitute; that exceptions to this golden rule, pace assistance under the Marshall Plan to post-war western Europe, do not provide evidence of the unimportance of domestic mobilisation; and that the flow of external resources today is primarily motivated by the self-interest of the capital exporting countries rather than by pure altruism (leaving out a few notable exceptions). Mathur has been able to collect evidence on two important areas of the flow of external funds: one, US food aid under PL 480, and the other, the net balance of external payments, insofar as India is concerned, arising from foreign investment in India.

There has been considerable debate among researchers in the past on the precise impact on Indian agricultural growth of the availability of concessional foodgrains from the US under PL 480. It is not either necessary or relevant to go into details of that controversy here, for Mathur has approached the problem from a wholly new angle: what impact did the export of agricultural products (at concessional prices) under PL 480 have on the US? And in this context, Mathur has been able to demonstrate (a) that the real value of the supplies under PL 480 was no more than the concessional price charged by the US for these exports; (b) that these exports were able to sustain incomes and (agricultural) production in the US which would otherwise have seen a collapse of the type witnessed during the Great Depression of the thirties; (c) that as a result of PL 480 exports, the US was able to *increase* its share of agricultural exports in the world over a longer period, so much so that many developing countries having got used to imports under PL 480 became commercial importers (of agricultural commodities) from the US, to the exclusion of other exporting countries; and (d) that the rapid increase in agricultural productivity in the US in the post-war period was due in no small measure to the price (and income) support provided through the mechanism of PL 480 by offloading burdensome surpluses of the US. In the absence of PL 480, the Commodity Credit Corporation would not have been able to sustain the price support provided to US agricultural producers. Indeed, so telling has been the marshalling of data by Mathur that one finds that the US—a marginal producer of rice—has of late become a major rice exporter in the world (on commercial terms), to the exclusion of the traditional rice exporting countries of south-east Asia. This is primarily because PL 480 enabled the US to maintain stability of export prices which shifted the market away from the traditional exporters; the availability of concessional imports also encouraged many importing countries to switch their import pattern, and once this had been achieved, commercial imports continued from this newly established source of supply.

For wheat, wherein productivity gains have been startling in the US, PL 480 gave an adequacy of total world demand (for US supplies) which provided the main stimulus for increased production, the real pay-off coming later with the very large demand for wheat as animal feed from the USSR. But, quite apart from the gain to the US, the general atmosphere of availability of supposedly concessional supply of wheat from the US induced in many developing countries an atmosphere of smugness which militated against growth of production in these countries. This latter effect has been established by many scholars insofar as the Indian experience is concerned.

Mathur's other detailed inquiry pertains to the balance of payments effect of foreign investment and foreign collaboration in India. In this part of his analysis, there are admittedly some flaws; Mathur has correctly analysed the generally pernicious role of transnational corporations, but his analysis of the impact of foreign investment and foreign technical know-how import is only partially valid. It is certainly correct to state that the primary objective of a transnational corporation is to maximise global profits; and because of divergent tax rates in different host countries, there is widespread practice of manipulative transfer pricing with the result that most developing countries—at least those that seek to raise resources for development through direct taxation—are left with a negative balance of payments impact arising from the operations of transnational companies. It is also correct to state that by and large such companies bring in little by way of investment funds; they tend to capitalise know-how fees, royalty, and sale of capital goods (at inflated prices) and they take advantage of a protected market for palming off outmoded technology.

All this is well known. Mathur has cited the example of the multinational drug companies whose record of exploitation of developing countries has been analysed by many authorities and scholars in the past. In fact, even other than drug companies, the record of foreign companies in India has been somewhat dismal generally. For example, even *100 per cent foreign owned companies* like Goodyear and Firestone debited their Indian subsidiary companies for technical know-how obtained from the headquarters even though it later transpired that—certainly for Firestone—both the

TABLE: GROSS PROFIT AS A PERCENTAGE OF CAPITAL EMPLOYED

	1977-78	1978-79	1979-80	1980-81	Average
1 Subsidiaries of foreign companies	17.9	17.3	17.3	14.8	16.8
2 Minority participation foreign companies	11.9	12.1	12.6	11.8	12.3
3 Foreign controlled rupee companies (313 companies)	15.4	16.2	16.2	14.7	15.6
4 Indian controlled companies (2,438 companies)	9.6	10.2	11.4	11.1	10.6

equipment and know-how used by them (in India) were outmoded, inefficient and high cost. In fact, the remittance of such payment for know-how goes directly counter to the claim of protagonists of foreign investment that the inflow of foreign funds in the form of equity is cheaper than foreign borrowing because the former involves risk capital. In the instant case cited, there was not only no risk (in a protected market), there was a wholly unwarranted payment for technical know-how by a subsidiary of a wholly-owned foreign company.

Mathur is also correct in evaluating the latest changes in the Foreign Exchange Regulations Act (FERA) as entirely counter-productive. The requirement to reduce foreign equity in non-Appendix I industries to 40 per cent, at the same time conferring on them a status at par with wholly Indian companies—thereby allowing them all facilities for expansion and diversification—has in fact resulted in increasing payments (and repatriation) of dividends abroad, and at the same time keeping control over the companies in foreign hands.

Although Mathur is correct in highlighting the historical necessity for capital to seek investment opportunities abroad, as stated earlier, he is yet only partially correct in this part of his analysis. In the first place, one cannot, one should not, rule out the flow of foreign technology. This is not to say that our present technology import policy cannot be faulted; in fact, of late our policy in this regard has, in many ways, been both unplanned and erratic, and we have not paid adequate attention to the problem of developing our capability to absorb, adapt and develop imported technology, without which the import of technology has no long-term positive results.

Mathur's focus is, of course, different; he is only highlighting the net balance of payments impact of the import of foreign capital and foreign technology. Even here, however, it would be incorrect to include payments for royalty and technical know-how in the aggregate receipts and payments in regard to foreign capital, since know-how payments are largely made by wholly Indian firms whose net balance in regard to external payments we are not able to isolate. Even though Mathur has shown all three types of remittances separately—namely, the net outflow in respect of subsidiaries of foreign companies, of minority participation companies, and purely technical collaboration companies—the net payments balance in respect of the last mentioned group is added to derive the overall share of these three in the current account payments deficit. This procedure is not warranted.

Nonetheless, even if we were to remove the outflow of foreign exchange in respect of royalty and technical know-how fees, the net payments balance of subsidiaries of foreign companies and minority participation foreign companies would account for 26 per cent of the overall balance of payments deficit of the country on current account during the decade 1960-1961 to 1969-70. If one were to consider only the last year, namely, 1969-70, these companies would account for as much as 92 per cent of the overall current account deficit in the balance of payments of the country that year. Unless one is to presume that the contribution of these companies to India's overall economic growth has been outstanding—and there is no reason to make this supposition—it would be seen that notwithstanding the earlier restrictions on foreign investment, imposed since the early years of planning (prior to the introduction of FERA, 1974), foreign investment has proved to be a significant net drain on the Indian economy.

Mathur's analysis does not extend to the post-1974 FERA period. However, judging from the figures of profitability of foreign-controlled and minority participation foreign companies relative to the profitability of purely Indian companies over 1977-78 to 1980-81, one may reasonably surmise that in spite of FERA—may be because of it—the net balance of payments impact of the former has if anything worsened. The figures of profitability of different types of companies, cited by Mathur, are worth reproducing here (see the Table).

One has to add that these are balance-sheet figures. Profits earned through manipulative transfer pricing (by foreign controlled companies) are not part of the profits shown above. In the latter context, Mathur has quoted a study by a US economist (Roland Muller) to suggest that "the dictates of global profit maximisation would lead one to expect underpricing of exports averaging 40 to 60 per cent and overpricing of imports ranging anywhere between 20 per cent and 8,000 per cent... In many cases, the transactions involve a 'triangular trade', being routed through a holding subsidiary located in an offshore tax haven such as Panama or Monaco."

What lessons emerge from Mathur's painstaking study? The conclusion is inescapable that there is no quick short-cut to development; that the path to self-reliance calls for discipline, strength of purpose, and the will, the determination to make the sacrifices necessary to increase the rate of saving in the economy and to apply all available resources for the overall national good. That in turn requires certain domestic policies which need not detain us for the present. But heavy dependence on external finance has its own booby traps. That is not to say that a country must become 'isolationist'. But the effort calls for, first and foremost, development of the capabilities of the people of the country; and that, in turn, requires care and discrimination in regard to dependence on external support. External finance—especially external finance which is superficially and deceptively easy and cheap but which has its own insidious effects in the longer run—can sap the 'will' of developing countries to make the effort required to achieve self-sustaining growth. This is also emphasised by Mathur when he says (with Swamy Vivekananda) that "nations like individuals must help themselves".

B P Mathur's analysis of three sub-sets of the problem of foreign funding—the rationale and impact of US assistance under PL 480, especially for promoting US exports; the activities of foreign drug companies in India; and the net balance of payment impact of foreign companies (both wholly owned and minority participation) in India—is a valuable contribution to the existing literature on the subject of foreign finance as a means of bridging the gap between domestic investment and savings in developing countries.

Overlooking the Essentials

Padmini Swaminathan

The Voice of Enterprise: 150 Years of the Madras Chamber of Commerce and Industry by R Tirumalai; Macmillan India Ltd, 1986; pp 464 + xxii, Rs 150.00.

THE book under review purports to chart out a definitive history of the Chamber against the background of the economic growth and development of the southern region. The author has divided the stretch of 150 years into four periods: first, from 1836 to 1900—the period of the formation of the Chamber, and its 'intense activity for creating the infrastructure'; second, the period 1900-1920—the period of the reforms and the Chamber's reactions which the author characterises as a 'revolutionary phase in its history'; third 1920-1950—characterised by a transition from a colonial administration to the constitutional set up of free India; and fourth 1950 to 1986—the era of modern industrial growth and commercial extension.

The author views his work as being set against a broader canvas—not a mere 'in-house history' of the Madras Chamber but one encompassing the growth and development of commerce and industry in their several facets in the Madras Presidency (as it then was) and later in Tamil Nadu state. The activities of the Madras Chamber are sought to be superimposed on this canvas. ("It can hence have a wider appeal to the general public interested in aspects of the economic history and the industrial evolution of the region".)

The composition of the Madras Chamber (almost up to 1950) is revealing. Unlike the Calcutta Chamber and the Bombay Chamber which had a fair sprinkling of Indian merchant houses, in the Madras Chamber, however, of the eighteen founding members only two were Indians. The number decreased to one in 1917. In the centenary year (1936) it still had only two Indian members (p 31). Even in 1955 although the majority of the members were firms in which British capital had predominated, most of them were rupee companies with Indian investments (p 322).

The significant contributions made by the Chamber to the creation of infrastructure has been elaborately described—the organisation of postal and telegraph services, the building of the Madras harbour and the extension of railway lines. Besides, the Chamber articulated its standpoint and pressed for a number of reforms with regard to legislation concerning direct and indirect taxes, import and export duties, currency and exchange, banking, labour legislation, local and judicial administration.

What is conspicuous by its absence is a critical examination of the facts. The book displays an inability to go beyond mere description and probe, if not at least hypothesise, what motivated the Chamber to go in for particular kinds of activities, particular decisions, particular standpoints, etc, at various junctures in the course of its long history. Meticulous attention to details concerning taxation, infrastructural facilities and the like has been achieved. The book however, overlooks, almost completely, the intense debates that took place at specific points of time over certain issues, a discussion of which would have shown the Chamber in its true colours.

At various points in the book one does come across statements such as:

(a) The Chamber objected to an Indian succeeding a European collector of income-tax (p 66).

(b) The Chamber was intent on retaining the original jurisdiction of the Madras High Court unabridged, ostensibly because international, commercial and mercantile laws had to be applied, but underlying that was the antipathy to Indian judges and magistrates hearing cases involving the Europeans and the foreign firms (p 84).

Such passing statements conceal not only the lengthy debates that took place, but more important, fail to convey the whole ethos of the period in question. For example, the subject of the industries carried on in jails, with special reference to their competition with similar industries carried on by private enterprise, was a bone of contention between the Chamber and the government right from 1880s to the 1930s, so much so that even the Conference of Chambers of Commerce of the Empire held at Sydney in 1909 passed a resolution in these terms:

> Whereas private enterprises has the right to be protected against the competition of articles manufactured by convict labour at an artificially lowered cost of production; and whereas there are indications of a tendency in certain parts of the Empire to develop the commercial element of jail labour to the injury of private manufacturers, this Congress approves the principle that the produce of jail manufacture shall be used in government service only, but in no case should power machinery be employed in jails for the production of articles of trade.[1]

The colonial government's disagreement with the Chamber on the whole issue was spelt out in no uncertain terms:

> the commercial community in general appears to hold the opinion that, as soon as an individual is placed in jail, his labour would be lost to the country and he is no longer entitled to earn his living. There is a large prison population for which some suitable labour must be found, and I consider that the ordinary tax payer may reasonably expect that the labour shall be as far as possible remunerative, and that the prison population should be to some extent self-supporting, and this cannot be done without some interference with private enterprise... The whole truth of the matter is that Messrs Binny and Company consider that they have a grievance against this jail (Central Jail, Coimbatore) because we have taken up several government contracts which I believe, used to be in their hands. Whether we are justified in taking up government work is a matter of opinion upon which the jail department and private firms are not likely to agree. I maintain that government is justified in using prison labour for meeting the requirements of its own labour.[2]

The Chamber's opposition to the efforts of the Madras government to foster indigenous industries and in helping in the development of new industries and demonstrating their commercial viability has received a slightly more elaborate treatment (pages 118-120). But nowhere does the book capture the acrimonious tone of the debates between the Chamber and the government and between the Chamber and Indian merchant/educated classes. For instance, decrying the attitude of the Chamber of Commerce, Madras, towards government involvement in the chrome tanning industry, Chatterton (an official in the Madras government) stated vehemently:-

> It seems to me obvious that from the strong opposition offered by the Chamber of Commerce and from the European mercantile community to the policy of government assisting in the development of new industries they fear that the fostering of indigenous industries will place Madras in the same position as Bombay and that the Indians will gradually acquire a commanding position in the mercantile and manufacturing industries of the Presidency. This, I submit is eminently desirable... It seems to me impossible that the present state of things should be allowed to continue indefinitely. In the past the European mercantile community have displayed no great amount of energy and ability in building up the industries of the Presidency and there is less hope in the future that they will be able to achieve a better result. There is, I have reason to believe, a good deal of Indian capital seeking investment and there is undoubtedly an ever increasing number of youths turned out by our university system for whom it is difficult to find employment suited to their education and capacity for work. Mr Chambers (of the Madras Chamber of Commerce) complains in regard to training that men of the required character and knowledge are not obtainable and yet he would have the government tannery in which such men are being trained shut down. Only a few years ago the Chamber of Commerce advocated a *laissez-faire* policy. Now that it has been demonstrated that something can be done and that some practical results have been achieved, they say we are going too far and all that is necessary is to establish technical

institutions for the training of workmen for non-existent industries.[3]

Such references do not find a place even in the bibliography.

It is here that the composition of the Chamber, the anxiety of its members to safeguard their interests against mounting opposition becomes relevant. The book is also silent about the formation of the nationalist business organisation, the South India Chamber of Commerce and the hostile attitude of the European business community to the former.

It is not just a question of the author's perception versus the reviewer's since, throughout, the history of the Chamber is recorded with practically no allusion to the growing politicisation and conflict within the private corporate sector, particularly since the 1920s, as reflected in the emergence of rival all India unions of British and Indian commercial interests. Again, insofar as post-independence India is concerned while the Chamber's contribution along with/through ASSOCHAM is mentioned the formation of the FICCI, the relationship between FICCI and ASSOCHAM, and the recent turmoil that shook these all-India organisations do not receive even a passing reference in a work that calls itself a 'history of commerce and industry'.

The organisation of the book makes reading very tedious. Further the periodisation does not make it any easier to pinpoint the significant achievements/contributions of the Chamber in any particular period. The tone of the chapter 'The Future, Perspective Projections and Role of the Chamber' is almost pontifical inasmuch as the author sets out the tasks that he thinks the Chamber should be undertaking such as assisting institutions like SIPCOT, SIDCO, TIIC and the like in formulating industry-wise programmes for growth and expansion, collection of statistical data, licensing data and other relevant documentation, primary information on industry and commerce and in the provision of a good well-stocked library, etc, etc. Precisely because it was never intended to be a critical study the author refrains from asking why an institution of 150 years standing has not done all this and much more. Unless questions such as these are raised and examined the constraints (political and otherwise) under which institutions such as the Chamber function will never become debatable public issues. The best service the Chamber could have done to itself and to society was to have commissioned a self-evaluative rather than a self-adulatory study of its existence these last 150 years.

Land Reforms Legislation in Karnataka

Myth of Success

C B Damle

A fundamental lacuna in most assessments of the impact of tenancy legislations in Karnataka is that they ignore the size of tenants as a class in the agrarian social structure on the eve of framing of the 1961 Tenancy Act. An attempt is made here to trace the gravity of the problem of tenancy in Karnataka that existed at the time of reorganisation of states in 1956. The analysis is extended to identify the effect of the tenancy legislation in changing the agrarian structure.

'HE evaluations of the implementation of enancy legislation in Karnataka without aking stock of the extent of tenancy in pre-and reforms period have either tended to how complacency over the rate of implementation of the Tenancy Acts of 1961 and 974 or have depicted how the benefits have een reaped by the economically well-off grarian sections such as dominant class enants. For some, however, tenancy was elatively a lesser problem in Karnataka to ave any significant impact on its agrarian tructure by the implementation of tenancy egislation. In fact, the political genesis of and reforms as a populist measure and also he role of dominant castes in framing and mplementing the legislation have been effectively traced by some studies. But the most important lacuna found in all these assessments of the impact of tenancy legislations in Karnataka is that they have ignored the size of tenants as a class in the agrarian social structure on the eve of framing the 1961 Act. Hence an attempt is made in this paper to trace the gravity of the problem of tenancy in Karnataka that existed at the time of reorganisation of states in 1956 and on that basis further analysis is done to identify the effect of tenancy legislation in changing the Karnataka agrarian structure.

The present Karnataka state has been formed during the linguistic reorganisation of states in 1956 by joining the different Kannada speaking areas of Madras, Bombay and Hyderabad states with the Old Mysore and Coorg provinces. In all these states, there had been different sets of laws governing their respective systems of land tenure, tenancy, land rent and revenue.[1] Since these land legislations were in vogue side by side, the new state administration had to face enormous problems while dealing with competing, often conflicting, interests of various categories associated with cultivable land.

Although the tenancy acts passed in different states appeared overtly to be in favour of the tenants they covertly gave enough scope to the landlords to resume the tenanted land for personal cultivation and the latter aptly used the given opportunity to set right the records to their best advantage. So from tenants' point of view, the tenancy legislations which were promulgated to bring progressive changes were no more than mock measures. Even the implementation of the Mysore (Personal and Miscellaneous) Inam Abolition Act of 1954 resulted in formalising the two strata of overlords upon the tenants, i e, the state as a 'super landlord' and the erstwhile *inamdars* as the intermediary category of oppressor who paid the tax to the state and was left free to fleece tenants-at-will whose insecurity was a growing and grave problem.[2] Hence the need for integrating the diverse legal and administrative structures relating to land control and utilisation had become urgent in Karnataka. But the measures adopted in this direction were neither scientific nor realistic. Political expediency compelled the government to go in for the easy way out and to introduce a uniform law for the reorganised Karnataka state by summarily suspending the tenancy acts of Bombay, Hyderabad and Madras states with an amendment to the 1952 Mysore Act through an ordinance dated March 11, 1957. This amendment allowed all the leases which were supposed to have expired on December 31, 1957, to continue for a further period of five years and later the same were annually extended up to 1965.[3] Thus by a stroke of pen, the *status quo* was maintained and almost all the measures providing protection to the tenants in the Karnataka state proved to be temporary because the progressive measures initiated under the Bombay, Madras and Hyderabad Acts were declared nullified.

Though the 1961 Land Reforms Act had received assent of the president of the Republic of India on March 5, 1962, its implementation actually started on October 2, 1965.[4] The main purpose of this act was to provide security to tenants against eviction and to prevent landowners from taking over plots which their tenants had cultivated long. The act was also designed to abolish tenancy, ban on further leases, fix fair rents with respect to the then existing leases and to impose ceiling on landholdings so that surplus land could be redistributed among poor cultivators and needy landless agricultural labourers. The act also had banned the acquisition of land by anyone except cultivators and agricultural labourers *unless a buyer planned to take-up self-cultivation.*[5]

The implementation of the 1961 Act as a measure of agrarian transformation, however, left much to be desired. There was a conspicuous delay of eight years in implementing the act (in 1965) which was originally framed by the Jatti Committee in 1957. This delay facilitated mala fide transfers of land under different names. Further, the act had almost failed to create a lasting impact on transforming the agrarian structure due to the gross misuse of concessions given to widows, minors, etc, to hold ownership over the leased-out land, and a similar misuse of the provisions granting landlords the right of resumption of land for *'personal cultivation'*—a phrase which was very loosely defined in the act. The exemptions from ceiling were granted to co-operatives, sugar mills, joint farming societies and the like, and these loopholes were fully exploited by the big landowners to escape the application of ceiling legislation. Consequently, the dominant classes with vested interests in the rural areas got abundant opportunity to use their muscle power for evicting tenants and to manipulate land records whereby the leased-out lands were converted overnight into lands under 'personal cultivation'.[6] The tenants on the contrary, had to claim their rights *vis-a-vis* their landlords by filing applications before the land tribunals whose procedures were cumbersome and could easily be circumvented. In the period following 1968, the tribunal officials were invariably over- burdened with work and were intimidated by local politicians who represented vested interests of the dominant class of landowners.[7] This shows the lack of political will on the part of politicians who made common cause with the landed interests. Thus the 1961 Act had the laudable objectives of transforming the agrarian structure but its provisions were rendered ineffective by the built-in loopholes which thwarted that change.[8]

The next leap forward came only in 1974 when the so-called radically amended legislation, the 1974 Act finally abolished all leasing of lands for cultivation (except in cases of soldiers and sailors); it abrogated all the existing leases, abolished the provision for resumption of leased-out land for personal cultivation and imposed a reduced ceiling on the size of landholdings as prescribed by the central guidelines of 1972. However, still the

plantation lands had been exempted because of their importance to the state's economy. Further, the act declared that every piece of land which was subject to lease on March 1, 1974, stood vested in the government. The tenants were asked to file their declarations before the land tribunals formed under the 1974 amended law. It is said that the 1974 Act displayed an intense concern for the interests of the tenants. It gave special powers to the tribunals to issue interim orders, a temporary injunction addressed to the parties or appoint a receiver to administer the land and that these orders were revocable and alterable under the tribunal's own power. The act, however, provided for compensation to be paid to the landlords by tenants; for this purpose it incorporated the fixation of rent on leased lands to calculate the amount of compensation payable to landlords.[9] Because the renewed land reforms attempted to plug the loopholes in the 1961 Act, the 1974 Act became the most publicised and progressive measure. It promised to acquire and redistribute surplus lands and thereby created hopes of drastic changes in agrarian scenario of Karnataka.

The 1974 Act provided the following facilities to the tenants:[10]

(i) Repeated extensions of the last date to file declarations for claiming ownership right which was finally extended up to June 30, 1979;

(ii) Exemption of stamp duty on all formal applications and affidavits filed by the tenants;

(iii) Free legal assistance to poor tenants wherever necessary for establishing their claim for ownership;

(iv) Consideration of declarations by the tribunals even if details such as clear survey numbers and extent of the tenanted land were not furnished by the tenants;

(v) The land tribunals were empowered to issue interim orders to prevent any forcible displacement of tenants, and if necessary, to appoint a receiver to administer the land since the tenant was vulnerable to even a temporary interruption of his farm operations;

(vi) The compensation to the landowner, fixed at minimum rate, was made payable in instalments to be deposited in the land development bank. Thus, the tenant was released from the direct subordination relationship to his erstwhile landlord. Subsequently even the remittance of compensation amount has been waived in the cases of tenants below the poverty line (i e, those below Rs 2,000 income per annum);

(vii) After obtaining the ownership rights, however, the tenants were forbidden from selling the plot for at least 15 years.

How many tenants were there to enjoy these concessions and privileges granted by 1974 Act? To answer this question, it is necessary to examine the size of the problem of tenancy in Karnataka to have any significant impact on agrarian structure in the state by the implementation of the tenancy legislation.[11] As we shall see later in this paper, it is difficult to agree with this view since it tends to distort the actual effects of 1974 Act.

The 1974 Act has been considered a very important watershed in the agrarian developments in Karnataka, though it was quintessentially an amendment to the 1961 Land Reforms Act, because its radical provisions and genuine concern for the tenants had had far-reaching consequences for agrarian rela-

TABLE 1: DISTRICTWISE DISTRIBUTION OF TENANTS, THEIR APPLICATIONS FOR OCCUPANCY RIGHTS AND SUCCESS OF TENANCY LEGISLATION IN KARNATAKA

AN INTERNATIONAL DEVELOPMENT ORGANISATION IN ORISSA AND WEST BENGAL HAVING RURAL AND URBAN PROJECTS, WITH AN ANNUAL BUDGET OF APPROXIMATELY 4 MILLION US$, IS LOOKING FOR DYNAMIC, COMMITTED AND RESULT-ORIENTED CANDIDATES TO FILL UP STAFF POSITIONS AS FOLLOWS:

1. **DEVELOPMENT PLANNER (One Post):**

Job description

To develop and simplify planning methods and tools. Coordinate planning, implementation and monitoring activities and train staff at all levels; prepare relevant reports and documents.

Qualifications

Postgraduate in Development Planning, Economics or relevant Social Sciences.

Experience

Minimum 5 years in micro level planning, preferably with voluntary organisations.

2. **MANAGEMENT INFORMATION SYSTEM (MIS) EXPERT (One Post):**

Job description

To consolidate data base and manage information system with a view to strengthen planning, implementation, monitoring and evaluation activities at all levels. Process, analyse, present data and draft reports.

Qualifications

Postgraduate in Economics & Statistics, with sound knowledge in Computer.

Experience

Minimum 5 years in similar lines, preferably with voluntary organisations.

3. **WOMEN DEVELOPMENT SPECIALIST (One Post):**

Job description

To help the Women's Desk and field staff. Coordinate and monitor women related development activities.

Qualifications

Postgraduate, specialised in Women's Studies/Social Work.

Experience

Minimum 2-3 years, preferably with voluntary organisations. Field experience essential.

4. **SYSTEMS ANALYST (One Post):**

Job description:

To formulate, design, develop and implement software systems in a PC/XT/AT environment using standard application packages towards Management Information Systems.

Qualifications

Postgraduate/Graduate in Computer Science with statistical background.

Experience

Minimum 3-5 years experience in system design and programming.

5. **DEPUTY PROGRAMME CO-ORDINATOR (One Post):**

Job description:

Together with project staff help people to build planning and implementation capabilities and leadership with a view to make them self-reliant. Assist the Programme Co-ordinator in planning, implementation and monitoring of the project. Prepare relevant reports and documents.

Qualifications

Postgraduate/Graduate in Social Work with specialisation in Community Development in the urban sector.

Experience

Minimum 5 years with voluntary organisations in urban areas.

6. **FIELD STAFF (30 Posts):**

Job description

To work with the poor and help in building their planning and implementation capabilities and leadership, with a view to make them self-reliant through appropriate interventions.

Qualifications

Postgraduate/Graduate in Social Work with specialisation in rural development Community Development and/or Women's Development.

Experience

Minimum 2-3 years for Postgraduate and 5 years for Graduate, with voluntary organisations in rural/urban areas.

N B

1. Sl.Nos. 1-4 are for positions in Calcutta at the Organisation's Head Office to start with, which will also involve frequent field visits to the project areas. Command over English and familiarity with Bengali and Oriya essential.
2. Sl.No. 5 is a Calcutta-based position. Leadership qualities as well as communication, motivational and analytical skills are essential. Command over English and Bengali is also essential.
3. Sl.No. 6 is for positions in the rural areas of Orissa and West Bengal. Ability to work with the poor, adaptability to local conditions as well as communication and motivational skills are essential. Command over the local language and familiarity with English is essential. Half of these positions are earmarked for women candidates.
4. Salaries are negotiable for all the positions.
5. Candidates are requested to send their full Bio-Data along with a note on their relevant experiences to : **G.P.O. Box 2313, Calcutta-700 001, by 10/9/1989.**
6. The post applied for should be indicated on the envelope.

tions in rural Karnataka as a whole and in the DK district in particular. Also, the evaluative studies of the Karnataka land reforms have focused attention mainly on the implementation of the 1974 Act and have not probed adequately into the latent effects of the 1961 Act, whose formulation had taken four years (1957-1961) and actual implementation took another four years (1962-1965). Daniel Thorner has rightly observed that Karnataka was one among 'the areas of least change'.[12] To James Manor three factors explain such an inertia in rural Karnataka.[13]

(i) There was low incidence of gross inequalities in the land distribution in Karnataka.

(ii) The state had the highest proportions of owner-cultivators and the lowest incidence of landless in the sub-continent.

(iii) The prominence enjoyed in state politics by representatives of the two dominant landowning castes, namely, the Okkaligas and the Lingayats.

It is difficult to accept Manor's first two explanations which have not been adequately justified with evidence. He fails to explain the absence of demand for land reforms from below. It is necessary to probe the grassroots level factors that prevented the demand from below manifesting itself in agrarian discontent.

The third explanation given by Manor, however, is important. The interests of dominant landowning castes were represented in the legislature and safeguarded by bureaucracy which could use pressure tactics in specifying the goals of land reforms (particularly land ceiling) in Karnataka in such a way as to provide built-in safeguards for the landowning dominant castes. As we shall see later in this paper, it was nothing short of a political manipulation that the 1974 Act was projected as a radical legislation with its frontal attack on tenancy. In reality, however, the land leases had been reduced to a great extent (11.2 per cent) in the state except in the two coastal districts of Karnataka. Hence, the seemingly revolutionary act had little left to be revolutionalised on the agrarian scene. However, the 1974 Act practically ignored the issues of landless agricultural labourers and also the work of redistribution of surplus land acquired after the implementation of ceiling legislation so as to benefit the poor sections. As such 'land to the tiller' has remained largely as an empty slogan in Karnataka.

To evaluate the impact of the land reforms legislations on the agrarian structure and relations in Karnataka, it is necessary, at least, to assess the following three interdependent aspects:

(i) Tenancy legislation—1961 and 1974;
(ii) Land ceiling and redistribution of surplus land; and
(iii) The impact on agricultural labour.

Tenancy Legislation

The main objective of the tenancy legislation was to bestow the ownership rights on tenants on their leaseholdings. The underlying rationale was that the tenants were exploited by the absentee landowning class through appropriation of a bulk of the surplus agricultural production, and sometimes whole of it, in the form of rent. Hence, when the tenants were made owners on the same holdings for which they had paid rent so far, it was expected not only to eradicate intermediaries, but also to give rise to a class of owner-cultivator to augment surplus production for marketing.[14] Thus, the tenancy legislation, if implemented successfully, was purported to achieve both social justice and higher production.

In Karnataka, the implementation of the 1974 tenancy legislation has been viewed as very impressive since more than 60 per cent of the tenants, it is claimed, have secured occupancy rights on their leased-in land.[15] Considering the tenancy issue, Theodor Bergman thinks that the implementation of land reforms is closer to the letter and spirit of law, though he comments that in Karnataka the tenants did not yearn for land as much as the tenantry elsewhere in India did.[16] However, other critics argue that it is the dominant class tenants who have taken the maximum advantage of the tenancy legislation in Karnataka except in the coastal region where small holding tenurial leases were more widespread. Hence, in this game of muscle show, the small landowners and the poor tenants, i e, lease holders of small plots, in southern and northern regions of Karnataka were the main losers.[17] There is, of course, a danger inherent in viewing all the tenants as belonging to the exploited category. M V Nadkarni has drawn our attention towards the tactics of dominant class tenants who had leased-in lands excessively from small and marginal landholders with the opening of new irrigational facilities in northern Karnataka. This class of landowner-turned-tenant being well represented in the government, could strike the iron when it was hot, and could thus reduce their small and poor landowners to the position of landless labourers.[18]

Almost endorsing Nadkarni's views Narendar Pani has argued that the 'significant' rate of the implementation of tenancy legislation in Karnataka does not mean that justice was brought to the doorstep of the poor and oppressed tenants; in reality it favoured the dominant class tenants. According to Pani, it is only in Dakshina Kannada, Uttara Kannada and to some extent in Shimoga districts, that the small tenants have benefited by the tenancy law.[19] In our opinion, this generalisation of Pani states only a partial, and not the whole, truth because his primary interests was confined to the evaluation of the impact of the 1974 Act. Hence, he has totally ignored the effects of the 1961 Act. Further, Pani has taken the 1970-71 Agricultural Census report (and its statistics on number of tenants, etc) as the basis for evaluating the rate of implementation of tenancy legislation in different regions and districts of Karnataka. This again should not be the real starting point to evaluate the impact of tenancy legislation in Karnataka, because the state intervention in the tenancy matters had started much earlier through tenancy acts in the early 1950s.

Against the number of tenants reported in the Agricultural Census, 1970-71, Pani has compared the number of tenants, who responded to the 1974 Act by filing declarations, with the number of tenants who were granted occupancy rights on the leased land by the land tribunals. This exercise led Pani to conclude that in six out of the nineteen districts of Karnataka, the rates of implementation were above 100 per cent. The districts are Bangalore (100.64 per cent); Chikmagalore (135.55 per cent); Kodagu (189.25 per cent); Mysore (140.55 per cent); Hassan (151.25 per cent) and Dakshina Kannada (118.9 per cent). To him, such an overwhelming response by the tenants to the 1974 Act can be explained in two ways:

(a) The underestimation of tenancy in the 1971 Agricultural Census; and
(b) The increased practices of owner-farmers entering into new tenancies after 1971, in spite of the ban imposed by the 1961 Act on fresh leases of land especially where dominant class tenancy existed.

The boom of declarations from tenants between 1974 and 1979, according to Pani was due to the fact that a large number of

Table 2: Cultivators and Agricultural Labourers in Karnataka (1961, 1971, 1981)

Category	1961	1971	Percentage Increase 1961-71	1981	Percentage Increase 1971-81

tenants, initially afraid of even disclosing their tenancy in 1971, eventually got over their inhibitions and apprehension and subsequently filed their declarations in the land tribunals and won them.[20] Though this assumption is quite valid, it gives an impression that most of the hitherto suppressed tenants came out boldly in 1974. We must note that all the tenants who had reported their status in 1971 should not necessarily have applied for ownership rights on their tenurial lease holding after 1974. It has been found during our field trips that some ex-tenants did not apply because they were intimidated to keep quiet by their 'goonda' landowners; some ex-tenants and their landlords had entered into compromise and thus the leased land had been resumed by the landowner against some mutually agreed compensation to the tenant; and in some cases the tenants have purchased their tenurial lease-holding from their erstwhile landowners. In our view, however, the greater and more bold response of tenants during 1974-1979 could be attributed to a special clause in the 1974 Act which provided for the inclusion of a new class of tenants, namely 'the deemed tenants'; 'whoever cultivating the land belonging to another, bearing the risks of cultivation was a deemed tenant if he did not belong to the landowner's family, nor he was a wage worker for a fixed wage in cash or kind'.[21] This provision in the 1974 law might have emboldened the majority of *genidars* (tenants) to file declarations who were without *geni-chits* (written lease-documents) and who greatly outnumbered the tenants who had reported their status in the 1971 Agricultural Census (see Table 1).

One cannot rule out Pani's apprehension that false applications might have been filed by vested interests to achieve undue advantages of the land reforms legislations.[22] But in our opinion, the size of such false declarations might not be as large as he imagines. Because false declarations arise in situations where the vested interests are involved in creating tensions in the villages, either to trouble other landlords or to sabotage and prevent the real tenants from getting the benefits of the land reform laws. It is generally agreed that such agrarian tensions were not a statewide phenomenon in Karnataka, but were confined to the DK district.[23] Hence, it seems that the active response from the tenants after 1974 was mainly due to the nature of the act that gave not just security but also ownership rights to the tenants on their leased-in holdings, thereby helping ex-tenants to break all the shackles of servitude.

We argue that if the rapid changes in the agrarian structure in Karnataka following the tenancy legislation of 1974 are to be understood, then the statistics of 1971 Agricultural Census do not constitute sufficient basis to explain the noticeably high rate of implementation of the land reforms legislation.[24] In the official evaluation of the implementation of land reforms, it was customary to calculate the proportion of the number of cases settled in favour of tenants to the total number of tenants petitions. This proportion was then compared with the total number of tenants as were recorded at the time of 1971 Agricultural Census. In fact, in his analysis, Pani also adopts uncritically the same method of calculating the rate of implementation. We have, however, shown with the help of statistics presented in Table 1 that if the 1971 Agricultural Census is taken as the basis of our calculation, then it gives misleading results with vastly inflated success rates of implementation as has happened in Pani's analysis. Our contention is that it is necessary to look at the problem of tenancy and its eradication not only in terms of the prospective effects of the 1974 tenancy legislation, but also its effects retrospectively since 1957. Clearly the landlords have always been more tactful than the tenants due to the former's economic domination, superior status, education and links of patronage and protection from political and administrative circles. Thus, implementation of a progressive land reform enactment would be the last thing they would put up with. In fact, landlords were well prepared to face the 1974 Act, having manipulated all possible readjustments in the land records. In other words, a large number of tenurial leases had been withdrawn by the landlords to be shown as 'under personal cultivation' which was not illegal under the unamended 1961 Act. Hence, there is a need to probe deeply into the size of tenants who were already evicted under the provision of 1961 Act and were thereby deprived of the subsequent opportunity to take the full advantage of the 1974 Act. We believe that for any real assessment of the extent of agrarian social transformation in Karnataka, following the 1974 enactment, it is necessary to use the statistics on tenants as they were recorded in the year 1957. To do so some caution and clarification are called for.

During the period immediately preceding the reorganisation of states in 1956, various acts for protection of tenants and fixation of fair rents had been enacted and also implemented in Bombay, Hyderabad and Madras states in which Kannada speaking regions were scattered. Although figures are not available, it can be surmised that some tenants from Karnataka must have taken the advantages of the provisions of different provincial legislations before the Karnataka state came into existence. ı ven granting that it is not possible to estimate the exact impact of these legislations on the Karnataka tenantry in the pre-reorganisation period, it does not weaken the strength of our argument that the number of tenants as recorded in 1957 in Karnataka (as available in the 1961 Census) is the most appropriate basis for the calculation and evaluation of the implementation rate.[25] This is substantiated by a comparative study presented in Table 1.

It is evident that the number of tenants who responded to the 1961 Act is infinitesimally small (see Table 1, column B), compared to the total number of tenants that existed in 1957 (see Table 1, column A). Regrettably though, it suggests that the tenants were either forcibly evicted by their landlords for resumption of leased lands for self cultivation or were coerced to forgo their legal claim (so as to appear as voluntary surrender) in return of protection to be sought by tenants applying for the security of tenancy provided under the 1961 Act. It is not surprising therefore that eventually, landlords destroyed records of the landleases as a prelude to their programme of large-scale eviction of tenants. Such a possibility cannot be ruled out given that compared to the actual number of tenant families in 1957 (column A), there were so few who actually reported their tenant status during the 1970-71 Agricultural Census (column C). The sharp decline in the reported cases of tenancy from 1957 to 1971 can be seen from the figures in column F (which represent the proportion of tenants in 1971 to those recorded in 1957) of Table 1. At the state level, this proportion was only 21.9 per cent of the total cases reported in 1957. It was even as low as 2.3 per cent in Kodagu district. In D K district, where the tenancy legislation is considered to have been implemented more successfully, the decline was quite sharp as over 85 per cent of the tenants (as recorded in 1957) had either been evicted or had not applied in 1971 and only 14.39 per cent cared to apply—which is simply appalling by any standards.

The decline in the reported tenancy varied within the coastal Malnad region itself from 97.7 per cent in Kodagu to 60 per cent in Uttara Kannada district (see Table 1, column F). There were two factors mainly responsible for such a decline in the number of recorded tenants from 1957 to 1971. First, the resumption of land for personal cultivation by the landowners was rampant; it is not unlikely that in many cases the landlords might have been sold the resumed land eventually. For instance, by August 30, 1970, there were as many as 95,000 resumption applications by the landlords under the 1961 Act.[26] Secondly, tenants totally dependant on the landlords felt all the more insecure. Of the total 1,49,950 cases of rent recovery and fixation of fair rents, 1,21,950 (81.3 per cent) were still pending for disposal up to August 30, 1970.[27] Such an indifference to the urgency of fixation of fair rents further aggravated the insecurity of tenants who lacked strength for prolonged resistance against their landowners through litigation. However, in the absence of any studies about what really happened during the 1957-71 period, it is possible to assume that the tenants were either allowed to operate on their leased lands without any record of lease-rights or the lands were simply resumed for personal cultivation, using either persuasion, or illegally by force or fraud. No doubt, in this period wherever personal cultivation was not possible, the lands must have been extensively brought into the market. At the

present level of our knowledge, however, only a studied guess can be offered since authentic figures/quantitative data on land market in Karnataka during those years were not available to us at the time of writing this paper.

To recapitulate our argument, by the time the 'radical' tenancy legislation was tabled in the state legislature for enactment in 1974, nearly 78 per cent of the tenants had already lost their occupancy rights due to evictions mostly on the flimsy ground of 'resumption for self-cultivation'. Hence, only the remaining 22 per cent of the tenants, who were fortunate to have continued their leased-in holdings, got the opportunity to claim ownership rights in Karnataka by 1971 (see Table 1, column F). However, it is necessary and important to note that about 45 per cent of the registered tenants in 1957 did stake their rights in response to the 1974 Act. But this figure included both the 'deemed tenants'—a category freshly recognised by the 1974 Act and the new leases that had been effected after the implementation of 1961 Act. It is argued here that the thesis about the presence of the 'black sheep'—i e, the dominant class tenants (landowners-turned-tenants) advanced by Nadkarni and Pani gains ground.[28]

From the column G of Table 1, one can further observe that the increased response from tenants to the 1974 Act was not very striking except in Hassan district, where the proportion of tenant applications (received up to 1979) to the total number of tenants as registered in 1957 has been reported to be as high as 158.74 per cent. Of course, Mandya, Gulbarga, Bangalore, Kolar and Raichur districts too show a considerable increase, but these were the areas where the problem of dominant class tenancies was most notable. The D K district and Uttara Kannada district which together constitute a homogeneous region where small tenancy holdings prevailed, did not show in reality an exponent position compared to 1957 situation, though actual numbers of tenants have been higher in these than other districts (see Table 1, column E). Hence, though the popular opinion is that the implementation of tenancy legislation was highly successful in Karnataka, and that especially it was more effective in D K district[29], our findings are to the contrary suggesting that the popular opinion is more of a myth than a reality.

The available studies on land reforms in Karnataka suggest that the implementation of tenancy legislation is successful because, of those tenants who had applied for ownership rights on their tenurial lease holdings about 60 per cent have benefited under the 1974 Act (see Table 1, column I). Our contention, however, is that a large section of tenantry had already been deprived of their statutory rights of occupancy and conferment of ownership and hence the real success of tenancy reforms is only 26.77 per cent in Karnataka state (see Table 1, column H). Only Hassan district shows an unusual trend as it has faired well in the implementation of the tenancy legislation of 1974. However, the situation of Hassan needs a closer scrutiny and a detailed study since the presence of dominant class tenancy in that area might have vitiated the expected change. Excluding Hassan, then rest of the districts show a poor performance in the implementation of tenancy legislation varying between 44.66 per cent in Uttara Kannada to 4.52 per cent in Kodagu district (see Table 1, column H). In our assessment, therefore, the complex problem of tenancy in Karantaka was very inadequately handled by the government which lacked political will and commitment. Unfortunately this dismal failure of land reforms in Karnataka as a whole was pushed under the carpet as hitherto the assessments based on the statistics of the recent period, i e, 1970-71 have dominated the political thinking and academic exercises.

Statistics presented in Table 2 justify our assumption that the eviction of tenants, as an effect of the 1961 Act was rampant in Karnataka. In fact, we argue that the success of tenancy legislation in Karnataka has been systematically developed into a myth. From Table 2, it is evident that between 1961 and 1971, there was nearly a 30 per cent decrease in the number of cultivators who included both the landowners and the tenants.* This significant decrease, in a decade when the land reform legislations were planned and implemented, has taken place in spite of the population increase by 24.2 per cent for the decade (i e, 2.4 per cent annually). On the other hand, there was a remarkable increase (54.3 per cent) in the category of agricultural labourers which indicates the sharp rise in the *proletarianisation* of cultivating tenants.

The number of cultivators may decrease due to large-scale alienation of land by small holders to big landholders resulting in the increase of large size operational holdings. But such a phenomenon has not occurred in Karnataka.[30] Hence, it was more probable that the decrease both in percentage and in absolute number of cultivators has occurred on account of large-scale eviction of tenants-at-will. Thus, it seems the 1961 Act has had a negative impact on the tenantry in contravention of the principle of redistributive justice implied in land reforms. Undoubtedly by 1971, the residue to be cleared off with 'a strong' tenancy legislation was relatively very small. Hence, any spectacular success of 1974 'radical' land reform, or its lasting impact on the agrarian structure in Karnataka was only a remote possibility. However, it must be noted that although the number of the cultivators increased during 1971-1981, it did not reach the 1961 figures (see Table 2). Actually over the two decades— 1961 to 1981—the number of cultivators decreased by 10 per cent whereas agricultural labourers had increased by 107.5 per cent when the population increased by 57.4 per cent during the same period.

The argument relating to the massive eviction of tenants between 1957 and 1974 can be substantiated by a comparative view of the extent of tenancy in Karnataka in 1961, 1971 and 1981. From Table 3, it is evident that nearly 30 per cent (29.8 to be precise) of the holdings were leased-out to tenants for cultivation in 1961. The percentage of tenanted holdings, however, was very high in the two coastal districts in 1961 and also in 1971 (see Table 3) although it had begun to decline. But in every district, tenancy decreased sharply between 1961 and 1971. A R Rajapurohit has interpreted this declining trend of tenancy elimination as an indication of a positive change and in this sense, even some impact of the 1961 Act on the changing agrarian structure in Karnataka cannot be denied.[31] Such a rosy picture, is, however, disputable since we cannot get any evidence to show that by and large, the tenants were granted occupancy rights on their lease-holdings as a result of the implementation of the 1961 Act. On the contrary, we have already shown that the response by the tenants to the 1961 Act was rather sluggish (see Table 1). Moreover, though the Act had provided the tenants with the right of pre-emption, i e, privilege of first claim to buy the lands from the landlord, it was beyond the reach of tenant's resources excepting of course those of the dominant class tenants. Being financially poor, generally an average tenant could not buy the tenanted holding. Even socially, the tenant's changed status as landowners was not going to be welcomed without grudge in their respective villages. Therefore, the percentage of self-operated holdings in Karnataka must have increased mainly due to eviction of tenants since the 1961 Act had armed the landowners with the right of resumption for personal cultivation and at the same time had fixed the ceiling limit on holdings rather generously. In spite of these deficiencies in the enactment as well as implementation of the law, the government of Karnataka has claimed 'achievement' in the tenancy eradication in the state on the basis of figures presented in column C of Table 3.

Land Ceiling and Redistribution of Surplus Land

A discussion on the effects of the Land Ceiling legislation that was incorporated in the 1961 as well as in the 1974 Acts is relevant here to understand the failure of tenancy legislation in Karnataka. Most of the studies have concluded that the big landlords could find enough leeways to escape from

* In the 1961 Census, the term cultivator was defined thus: "For purposes of census a person is working as cultivator if he or she is engaged whether as employer, single worker or family worker in (a) cultivation of land or supervision or direction of cultivation of land owned or held from government, and (b) cultivation of land or supervision or direction of cultivation of land held from private persons or institutions for payment in money, kind or share" (*Census of India*, 1961, Vol XI, Mysore, Part I-A, General Report, Chapter X, p 562).

he blow of ceiling legislation.[32] They were east affected as the ceiling limit was fairly high for all classes of lands. According to the 1961 law, a maximum 27 standard acres of first class wet land was fixed as the ceiling which varied up to 432 acres of dry land that was maximum permissible for a big family.[33] Even under the 1974 Act, the big landlords could retain vast lands under their ownership by dividing their family into a number of 'units' for technical purposes and also by *benami* transactions of landed property. Giving an insider's account of what was happening in Karnataka, seasoned bureaucrats like Rajan, who was associated with the reforms implementation, has admitted that this provision was a loophole purposely kept in the law.[34] Though the 1974 Act intended to overcome the weaknesses inherent in the ceiling provisions of the 1961 Act, it ultimately turned out only to be a publicity stunt of the government. Compared to the 1961 Act, the so-called stringent ceiling provisions of the 1974 amendment actually could not harm those who owned beyond limit the best quality land under private irrigation. Thus, once the big landlords were out of danger of the implementation of ceiling legislation, they did not hesitate to use unlawful tricks to resume the tenanted holdings either by compromise or by force. So, the provision of ceiling in terms of units, though apparently stringent, was really not an effective measure since it only helped in perpetuating the inequalities in landholdings in the agrarian structure in Karnataka.

It was not surprising if one had expected some spectacular change to take place by 1976 in the structure of land control (i e, in size groups of landholdings) in Karnataka since the 1974 Act had set December 31, 1974 as the deadline to file declarations by those who owned lands beyond ceiling limit and November 18, 1961 as the reference date to determine the surplus land. But it is evident that the agrarian structure had hardly been visibly affected by the ceiling legislation in Karnataka. For instance, the percentage of big holdings, i e, above four hectares had decreased only by 2 per cent, i e, from 23.7 per cent in 1970-71 to 21.78 per cent in 1976-77. Similarly the area controlled by the big landholders decreased only by 2.37 per cent, i e, from 65 per cent in 1970-71 to 62.63 per cent in 1976-77 which means they still controlled large tracts of land disproportionate to their class size.[35] Further, the average land held by the class of big landowners is 94.43 hectares or 233 acres that stands in contrast to the maximum ceiling of 54 acres prescribed by 1974 Act even for the dry land (D class). The 1974 Act permitted the companies and even individuals to hold extensive plantations without ceiling prescriptions. Also the non-agriculturists were allowed to buy and sell plantations growing cardamom, cocoa, coffee, tea, pepper and rubber. This shows that a clear ideological foundation of social justice was lacking in the supposedly progressive piece of legislation in Karnataka.[36]

The 1974 Act stipulated that all the surplus land, vested in the government, was to be allotted among (i) dispossessed/displaced tenants having no land; (ii) landless agricultural labourers; (iii) released bonded labourers; and (iv) landless persons, ex-service men or other persons residing in the same or neighbouring villages whose gross annual income did not exceed Rs 2,000. However, it was obligatory for the government to see to it that at least 50 per cent of the grantees would be from the Scheduled Castes/Tribes categories.[37] But, as expected, the bureaucratic inertia in the implementation of land ceiling prevented any effective redistribution of surplus land to the needy. The initial years after the enactment of 1974 Act witnessed neither rigour nor speed in the official effort for implementation. The redistributed land constituted less than 8 per cent of the legal surplus land, i e, less than 0.2 per cent of the total cultivated land in the state. It would, therefore, be difficult to deny that redistribution of surplus land had been a low priority item on the government's policy agenda.[38]

The data available in the monthly reports compiled by the Revenue Department (Land Reforms), government of Karnataka, should suffice to support our contention that the implementation of land ceiling was unusually tardy in Karnataka (see Table 4). The existence of very large size holdings in great number and the availability of surplus land for distribution varied greatly for districts in Karnataka. Table 4 shows that the declarations filed under the 1974 Land Ceiling Law were more in the districts of the northern region where numerous large or extensive holdings controlled vast tracts of land. The districts of Chitradurga, Shimoga and Bellary, closer to the northern region, also had more cases whose large-scale holdings exceeded the ceiling limit. In the remaining districts of the state, the situation was somewhat uniform. However, compared to tenancy, the issue of land ceiling in the coastal districts was relatively a less significant one.

The disposal of the declarations was nearly complete (99.7 per cent) by August 31, 1987 throughout the Karnataka state (see Table 4, column J). But it was only in very few of the disposed of cases that the implementation machinery was able to determine surplus land. For example, the proportion of landholders (whose surplus land was identified) to the total number of declarations disposed of, varied from district to district. It was as low as 0.9 per cent in Kodagu district of the Malnad region and was as high as 17.8 per cent in the Bellary district in the southern region. The state average in this regard was only 6.8 per cent (see Table 4, column K). Also the extent of land actually identified as 'surplus' to the total land under declarations was as low as 4 per cent in Raichur district to 0.4 per cent for the Uttara Kannada district (see Table 4, column L). Explanation for such a situation is not far to seek. The 1974 law required declarations to be filed by every landowner who had 40 acres of dry land, or 20 acres

TABLE 3: DISTRICTWISE LEVELS OF TENANCY IN KARNATAKA, 1961-1981

Regions and Districts	Percentage of Tenanted Holdings

of rainfed wet land, or 10 acres of fully irrigated land. This acreage was considerably lower than the prescribed upper ceiling limit of 54 acres of dry land or its equivalent for a family of 5 members or less. Further, every adult male member and a widow in the family were treated as independent units entitled to hold land separately as per the ceiling of full 10 units of landholding. This liberal provision tremendously reduced the number of potential surplus holders among the declarants who could then show 'nil' surplus. This happened in large number of cases.[39] This explanation seems technically correct, but in reality the 1974 law itself had given sufficient scope for readjustment by transfer of land in the land records and enabled many to evade the law. It is, therefore, surprising that even after 14 years since the implementation of the 1974 law, only 52.5 per cent of the total declared surplus land has been taken possession of by the government, out of which only 35.5 per cent has been actually redistributed (see Table 4, column M and N). In Bangalore district, however, the whole work of redistribution remained untouched. The official machinery has, however, acted promptly to ensure that the redistribution of surplus would conform to the legal provision: namely that 50 per cent or more of such land grantees should be from amongst SCs/STs; this percentage is 61.2 in Karnataka. By no means, this is a commendable attainment because the redistributed lands were mostly of poor soil quality, dry and unirrigable. The studies on the progress of redistributed holdings often have shown that the cropping intensity, income and returns from farm business were comparatively low and hence uneconomical in such lands.[40] The official evaluation by the government of Karnataka also testifies that the condition of the allottees in the utilisation of redistributed land was deplorable.[41]

Impact on Agricultural Labour

We have seen that the enactment of the 1974 law brought little difference, and failed to radically change the basic socio-economic structure of the agrarian society. Hence, o may anticipate some change (but not substantial one) in the existential conditio of agricultural labourers as a class once t land reforms legislation is introduce Because, such a legislation entails a trans tion in the position of landowning, land co trolling and land-using classes. In fac initially both tenants and agricultur

oourers together struggled for a better al. However, after a series of tenancy forms had conferred security of tenure and er occupancy on their leased holdings, in way throughout India, the class of agri- ltural labourers had been left high and dry. ey had, therefore, higher stakes in further nd reforms (including ceilings) and their thful and stringent implementation.[42] his is equally true of agricultural labourers cluding the landless) in Karnataka.

As a part of the land reforms, it was erefore, necessary to incorporate measures uplift the wage-earning class in the rural eas. But initially the issue of agricultural oourers was not at all touched by those ho framed the Land Reforms Act, 1961 or en the 1974 Act. The programme of eradi- tion of tenancy pre-occupied their minds much that all other problems tended to relegated. Finally a special provision was corporated in the 1974 law, as late as in 79, conferring the agricultural labourers ith the right to apply for ownership of their velling units on lands which legally did not elong to them (provided they were living those dwellings as on January 1, 1979) ith 5 cents (equivalent to 1/20th of an acre) f land surrounding their dwellings.[43]

The government, however, took no initia- ve in promoting the interests of landless gricultural labourers.[44] As shown in able 2, although the class of agricultural bourers had grown enormously (by over 07 per cent) in Karnataka between 1961 and 981, very few labourers actually came for- ard to claim the benefit under the land eform law (see Table 5). As in other cate- ories even in the case of agricultural bourers, an impressive number from the oastal districts (particularly the DK district) ad taken the lead in filing declarations for he dwelling units. But this did not happen other parts of Karnataka (see Table 5, col- mn A). However, in the absence of studies, is rather difficult to explain why agricul- ural labourers did not come forward to app- for the ownership of their homestead in he remaining districts.

In Karnataka, 28.4 per cent of the agri- ultural labourers consisted of the Scheduled Castes and Scheduled Tribes, while only 13.2 er cent of them belonged to the class of ultivators in 1961.[45] The SCs/STs con- tituted more than 50 per cent of the labour orce in the districts of Bangalore, Kodagu nd Kolar. Apart from these in Bidar, Chik- nagalore, Chitradurga, Hassan, Mandya nd Mysore districts the proportion of those elonging to SCs/STs was more than the tate average in the agricultural workforce. n the absence of specific programmes of uaranteeing regular work to them, their ondition was not likely to undergo any adical change after the introduction of the and reforms. Moreover, as mentioned arlier, the surplus land distributed to the Cs/STs was of poor soil quality and vithout irrigation facilities. Hence this neasure could hardly improve their lot. ince the Scheduled castes lived in bondage,

a life of social degradation for generations, it was too much to expect their high turnout for staking claims on their dwelling units under Section 38 of the Land Reforms Act 1974.

It is generally expected that a reasonably successful implementation of land reform legislation leads to depletion of agricultural labour in the countryside. However, this did not happen in Karnataka. The overall figures for Karnataka show that the proportion of agricultural labourers in total workforce was more or less constant, i e, 26.7 per cent and 26.6 per cent in 1971 and 1981 respectively.

The wages of agricultural labour vary from district to district and also within the same district. Further, the relationship between the hirer and the hired has taken diverse forms involving peculiar mutual obligations. Though the Minimum Wages Act, 1948 was implemented in 1959 in the state, it has mostly remained on paper.[46] While the administration may claim to have given relief to the agricultural labourers to a certain extent, it did not take precaution to see that the land reforms would not adversely affect and destabilise the agricultural labourers before and even after 1979. In fact, revenue and law enforcement agencies not infrequently used force to evict agricultural labourers from their dwellings on lands they did not own.

Follow-Up Developmental Measures

The beneficiaries of land reforms legislation such as the surplus land grantees as well as the ex-tenants needed support as soon as the ownership on land was granted to them. Though the government has introduced many schemes to promote development of lands and also to help the beneficiaries to purchase required inputs all the schemes were no more than an eye wash. Firstly, the assistance never came immediately after the grant of land ownership to the beneficiaries and secondly the budget allocation was very poor to have any significant achievement. For instance, under the Land Development Assistance (LDA) scheme introduced in 1975-76, specifically for the surplus land grantees, the government assistance worked out to only Rs 675 per hectare as against the planned assistance of Rs 2,500 per hectare. Further, it is really a pity that after more than a decade of introduction of the LDA scheme, about 10,700 beneficiaries (40.7 per cent) have remained without any help under the follow-up programme. A similar drawback is visible in the implementation of Negilu-Bhagya scheme meant for the poor-ex-tenant beneficiaries as also the surplus land grantees introduced in 1982-83. The assistance under this scheme has two components: (a) Supply of one pair of bullocks at a cost not exceeding Rs 3,000 out of which Rs 1,000 is subsidy to ex-tenants and Rs 1,500 is subsidy in the case of surplus land grantees, (b) Supply of an input-kit, i e, a package of agricultural implements and inputs not exceeding Rs 500 per kit free for each beneficiary provided he is a small/marginal farmer (i e, below 2 hectares of holdings). But due to a meagre actual budget allocation of about Rs 1.53 crore (just 10 per cent of the proposed outlay of Rs 15.25 crore) for 1983-86, the physical targets had to be sealed down to a ridiculously low level of 5.6 per cent. Thus only 16,750 land reform beneficiaries were assisted during 1983-86, thereby covering barely 3.3 per cent of the total 5.11 lakh ex-tenants.[47] If bureaucratic lethargy and lack of funds was the problem in implementing the above schemes, the negligence of basic purpose of the programme is evident in the case of Small Farmers Development Agency established by the government of Karnataka. The idea was to channelise credit, irrigation and scientific inputs to the small holders. But this programme has proved to be a pro-landlord measure since the programmes designed to benefit the marginal and small holders, who constitute about 45 per cent of rural population; but are assigned only about 2 per cent of the public investment.[48]

The abolition of tenancy in Karnataka was given a wide publicity though its success was only a myth. At the same time, the equally important problems of landless agricultural labourers were given a low priority by the government. The rural poor of Karnataka have remained unorganised and efforts in unionising the agricultural labourers are not in operation. Also the agricultural wages have lagged behind the price increases in Karnataka. Moreover, the employment generation schemes such as the Employment Affirmation Scheme (EAS), Integrated Rural Development Programme (IRDP), Special Component Plan (SCP), Tribal Sub-Plan (TSP) etc, suffered from the low budget allocations, insufficient staff to handle the programmes and inadequacy of planning besides the general lack of political will. Added to these deficiencies, there existed endemic problems associated with bureaucracy, namely, delays, corruption, mismanagement of funds and confusion in the choice of priority work.

In conclusion, it can be said that the land reform measures in Karnataka have failed to achieve the avowed ideal of creating an egalitarian agrarian society. The legal measures could hardly sabotage the vested interests in land. On the contrary, the loopholes in the law were the aides in disguise to the landlords to maintain the *status quo* in the agrarian social structure. If the government had identified the actual tenants prior to the implementation of the 1961 Act, i e, the tenants existed during 1957 to 1961, then the task of redistribution of land could have been easier. But the government's interest was limited only to make it a populist measure and so the agrarian tension had mounted as the conflicting interests resorted for a show-down at least in a few pockets of Karnataka. The result is not far to seek. The economically influential landowners were the inevitable winners of the game. Even for the small number of beneficiaries of tenancy Act, the schemes of government assistance remained only a promise. In the case of acquisition and distribution of surplus land, the governmental apathy is unpardonable. An unimpressive achievement in granting rights to the labourers on their homesteads is a testimony to the fact that the agricultural labourers are still a rejected category in the government's scheme of rural transformation. Thus under these adverse conditions, it is too much to expect the poor tenantry and agricultural labour class to come out to stake their claims on land.

Notes on the Invention of Tradition

Rustom Bharucha

When people 'invent' tradition ('authentic' or 'spurious', through acts of 'cultural preservation' or 'subversion'), they unavoidably imply that they are no longer in touch with its immediacies. Yet an illusion is often maintained whereby the 'invention' is placed within the mainstream of tradition itself.

This essay discusses the more seemingly 'creative' inventions of tradition that have been implemented by our artists, directors and 'experts' in the Indian theatre. Much of the discussion focuses on the discourse *of theatre, in which concepts of the 'folk' and the 'theatre of roots' are examined as inventions of the urban intelligentsia.*

INSTEAD of attempting to define "tradition" in a pan-Indian context, I would like to situate it within its multiple uses in the contemporary Indian theatre. To what extent has "tradition" (which originates from the Latin word *tradere*, to "hand over" or "deliver") been used in the context of "handing down knowledge" or "passing on a doctrine"? And to what extent has it been "invented" (to use Eric Hobsbawm's valuable term) in response to larger political, economic, and social factors?

As I demonstrate in this essay, tradition can be invented in any number of ways, even though we may not be aware of it. The most conspicuous of "inventions" are "fabrications", such as the Republic Day Parade, where the diverse cultures of India are "unified" through a carefully choreographed spectacle. In recent years, this kind of "invention" has become increasingly virtuosic as is evident in the Festivals of India and the Utsavs of New Delhi. Here, through a conglomeration of effects, which could include songs, dances, tableaux, symbols, floats, fireworks, "informal" minglings between "native" performers and "foreign" spectators, selling of Indian food, and other "indigenous" activities, an atmosphere is constructed whereby "the Indian tradition" is affirmed, not necessarily as people in India would understand it, but as our government would like to represent it to the world.

In this essay, I will not deal with this ubiquitous phenomenon but focus instead on the more seemingly "creative" inventions of tradition that have been implemented by our own artists, directors, and "experts" in the Indian theatre. Much of the discussion will focus on the *discourse* of theatre, in which concepts of the "folk" and the "theatre of roots" will be examined as inventions of the urban intelligentsia. More often than not, when people "invent" tradition ("authentic" or "spurious", through acts of "cultural preservation" or "subversion"), they unavoidably imply that they are no longer in touch with its immediacies. Yet an illusion is often maintained whereby the "invention" is placed within the mainstream of tradition itself.

* * *

Mediations of Technology

At a very basic level, one could say that "inventions" develop from an urge to "find out or produce something new". They are not "discoveries" of things which already exist but need to be "exposed", "made known". Inventions uphold a different sense of the unknown. Instead of "exposure", they are concerned with *making* new artefacts. Very often, these artefacts emerge through the mediations of a new technology and machinery that precipitate an alteration of forms. In the following section let us examine some of these mediations through the intervention and assimilation of 'foreign' structures of representation.

It is well known that our tradition has always provided us with a surfeit of narratives in the theatre. Our "professional theatre" in the late nineteenth century scored some of its most spectacular successes with theatrical renderings from the *Mahabharata* and the *Ramayana*. That all-Indian phenomenon, the Parsee theatre, funded and administered by the Parsees, but acted, directed, designed, and most important, seen by a wide range of communities all over India, invariably had a stock of "traditional" plays. Invariably, they were mythological in content, providing a direct stimulus to the religious blockbusters of the early Indian cinema.

The point to be stressed here is that our "tradition" had already been mediated by the colonial machinery of the nineteenth-century theatre, the conventions and stage tricks derived from the pantomimes and historical extravaganzas of the English Victorian stage. However, it should also be emphasised that these derivations had been thoroughly "Indianised" through music, song, colour, pathos, melodrama, and the histrionic delivery of lines that are intrinsically a part of the popular theatrical tradition in India.

At a very elemental level, "tradition" in the nineteenth century commercial theatre meant "spectacle". It provided audiences with new possibilities of adoring goods and mythological heroes in kinetic, technicolour settings. In its importation of theatre technology, there were trapdoors that facilitated supernatural ascents and descents, a "fly system" that enabled *apsaras* to float rather precariously into the wings, and at a later stage, the novelties of the revolving stage, cloud machines, and the cyclorama.

So alluring were these derivations of an essentially foreign theatre tradition, and so widespread their influence, that even today one can trace their remnants in a number of "traditional" performances. In Yakshagana, for instance, or of what remains of it, traces of the popular Gubbi theatre tradition still linger in painted backdrops and histrionic acting styles that are anathema to the purists. I have even seen a Krishnalila performance in a village where a very belligerent female impersonator outstaged Krishna in a sequinned costume and wig that looked like relics from *Shirin Farhad*.

At one level, these commercial interventions are "perversions", but nonetheless, they have been absorbed within traditional performance structures in deference to "popular taste". It needs to be emphasised that the clear-cut distinctions between "popular culture" (which is the category in which "company theatre" or 'Parsee theatre" could be placed) and "folk culture" (to which Yakshagana ostensibly belongs), cannot be regarded as absolute or mutually exclusive. Nor can we assume that it is "folk forms" which invariably influence popular entertainment, because they happen to be older and "rooted" in the cultural psyche of the people. Very often, it is the other way around, when, for example, the "perversions" of commercial Bengali theatre, notably cabaret, have directly influenced the "folk" theatre tradition of Jatra.

In fact, if there is one "indigenous" source of influence that has played a fertile role in promoting new genres, it would not be the "folk theatre" (which is struggling to hold on to its identity), but the "company theatre" tradition, which no longer exists, but whose idiom has been absorbed in the commercial Hindi cinema, and more recently, in the representation of myth on Doordarshan serials. If one had to trace the origins of mass appeal embedded in Ramanand Sagar's *Ramayana*, one would have to turn to its use of Parsee theatre conventions, which are barely recognisable, yet perceptible, submerged under layers of conventions from other traditions. Apart from the obvious influence of mythological films, there are traces of science fiction, advertising, high tech, cartoons, and even through some convoluted process of unconscious assimilation, the visuals of Monty Python.

Whatever one may think of its artistic merits, one cannot deny that Sagar's *Ramayana* has been sufficiently convincing to millions of people to serve as a source of *darshana*. What may seem bizarre and mindlessly eclectic has been intensely familiar to the masses. The eternal fiction of the *Ramayana* has not merely survived its "invention" on the idiot box, it may even

has stimulated a form of Hindu revivalism, whose manipulative possibilities by fundamentalists and politicians need not be stressed. One can despair about the absence of historicity in representations like Sagar's *Ramayana*, but they also reveal, very decisively, that people are prepared to accept new "inventions" of tradition so long as their faith in dominant myths is substantiated and enriched.

In this regard, in reflecting on the mediation of new technologies to project myths, what needs to be stressed is not so much the technology itself, but how it is viewed. The *Ramayana* has been seen within the proscenium framework of the Parsee theatre tradition, which in turn has been miniaturised on the two-dimensional, rectangular television screen. It has also been seen for many years in numerous stagings of the Ramlila held in many parts of India, most notably in Ramnagar, where the *lila* extends over the entire town for a month. The fact that the *Ramayana* has survived its diverse "inventions" testifies not only to the innate richness of the epic and its deep significance to most Indians, but it also reveals the phenomenal viewing capacities of the Indian spectators, who are capable of seeing the illusion of an image with or without its technological mediation. Sometimes, if they feel inclined, they may focus only on the technology, such as a "special effect" in the *Ramayana* serial, and applaud its sheer virtuosity. But at other moments, all that matters to them is the "vision" that they alone see, which is precipitated by the representation, and yet detached from it.

Darshana is capable of subverting technology. Even if an Indian spectator may not be fully conscious of his seeing capacities, there is nothing quite like his ability to see God within an actor's frame. Nor can one underrate his capacity to tune in and out of an image. While avant-garde circles in America and Europe may cultivate the faculty of "selective inattention", it seems to me that this comes very naturally to our spectators. Particularly in our rural and *mofussil* audiences, one finds an almost collective concentration and dispersal of energies. One moment could be totally rapt, as the spectators see a divine presence on stage. This could be followed by a very candid, and frequently, critical response to the representation on the level of pure theatricality. Still at other moments, the play could be seen in a state of collective somnolence. But then, at just the appropriate moment in the narrative, everyone could be awake and totally absorbed in the action on stage.

I dwell on this enormously flexible seeing process because it may be one of the contributing factors to our "invention" of tradition. Certainly, it would be wrong to say that it is only "artists" who are capable of invention. What seems more pertinent (though harder to substantiate) is that there is a collusion between the artist and the people regarding the nature and limits of invention. At this point in time, one can say that technology has not yet co-opted the "visionary" possibilities of seeing assumed by our spectators in their viewing of myths. But in time to come, as these performances get increasingly commodified and the onslaught of the media becomes more fierce, it will be critical to see how the viewing capacities of our spectators will be altered. Will they still be able to see what they choose to see and are willed to see, or will they be numbed into total passivity? Will the "inventions" of tradition on the media create new myths, or will they simply reduce myth to the level of commercials?

ENVIRONMENTAL CHANGES

Apart from the mediation of technology in determining "inventions" of tradition, there are more practical matters that affect the changes in "traditional forms." A year ago, I attended a Ramlila performance in the village of Amaur near Kanpur to find a permanent Ravana made out of stone. I could sacrcely conceal my disappointment that the principle of burning the demon-god, so essential for the celebration of the *lila*, had been ignored for economic reasons. "It is too expensive to burn Ravana every year", I was told. "After all, this is a small village, not Ramnagar." Only later did I realise that Ravana had been burned, but symbolically, through his headgear and weapon, which were made out of paper and wood. The rest of his body remained indomitably cast in stone, but nonetheless, he had already been "burned".

These paradoxes of faith reveal the acute consciousness of our people, both to everyday matters of survival and the endurance of faith. For them, it is not a matter of "using" tradition (as it is for us in the so-called contemporary theatre); it is a question of *living* tradition and making the necessary adjustments to keep it going. If a traditional performance dies, then may be it was meant to, because it could no longer be sustained either economically or socially.

About the worst attitude to tradition is to incarcerate it within an immutable form that ostensibly never changes. If tradition lives today, it is because it has always changed in the course of its history. How it changes within its own performative and cultural context is frequently undocumented and even forgotten, because the change occurs slowly, organically, in deference to the larger needs of its community.

It is only in recent years through interventions like tourism, film documentation, and interculturalism that the changes in "traditional" performances have become at once more visible and swift. It could also be that we have developed a new awareness, a post-colonial consciousness, of what was previously taken for granted. In this context, I believe that one must differentiate between those changes which are intrinsic to the growth of a traditional performance, and those which are imposed on it through external intervention, though I must acknowledge that it is sometimes difficult to differentiate between them.

When I hear, for instance, of how a Theyyam performer has of his own accord incorporated a flashing electric bulb into his headgear to enhance his sense of the demoniac, this seems like a perfectly valid response to electricity, an intervention in the rural performer's world. The change in the costume is intrinsic insofar as it comes from the performer's response to his changing environment. On the other hand, can I deny that I am disturbed to see neon lights in a *koothambalam*, where, ideally, the *koodiyattam* performer should be watched in the glow of the *vilakku*, his eyes illuminated by the fire in the lamp? The problem with this use of electricity is that it does not seem to bother the performers themselves. It is my "aesthetic" sense that is jarred, revealing my own "taste" and cultural conditioning.

Still more problematic is the transportation of a traditional performance from its own environment to a proscenium-bound, air-conditioned theatre in New Delhi or a *mela* in Paris. This environmental change alters the very context of the performance. In some extravaganzas, the performers are merely "slotted" into a spectacle over which they have no control. Reduced to exotica, they resemble spots of colour without mind, body, or soul.

How does one accept these changes in performances resulting from altered environments?

(1) In the case of the Theyyam performer, one cannot but appreciate the sheer ingenuity of the performer in incorporating a historical change (electricity) within the framework of his costume. Here one senses an organic relationship between the environment and the performer.

(2) In the case of the neon lights in the *koothambalam*, one can accept these lights as useful even though they fail to enhance the energy of the performance. At best, one could say that the performer learns to accept them, and then forget them, not unlike classical singers who have adjusted to the sound of the harmonium. In the long run, the use of "conveniences" like neon lights and harmoniums is, perhaps, best accepted as a compromise—useful, but not particularly creative.

(3) In the case of the altered environments provided by proscenium theatres and spectacles, it is difficult to accept their impositions on the choices of the performers. Inadequate exposure to these spaces, and more specifically, to the power relationships embodied in them, create an imbalance between what the performers are ready to give and what is expected of them from a foreign clientele.

In such spaces, the performers invariably fail to represent themselves. Rather, they are represented by the environments themselves, and by all the values—political, social, commercial—embodied in them. This does not mean that traditional performers should not perform in these "alien" spaces, but new

mechanisms and relationships need to be explored whereby performers have more time and power to control their representations.

* * *

Inventing the "Folk"

Expertise plays an important role in determining categories in which "tradition" can be placed. One such category is the "Folk", which received an official sanction at the First Drama Seminar organised by the Sangeet Natak Akademy in 1956. Inaugurated by S Radhakirshnan, who was then the vice-president of India, the Seminar was part of a series that was intended to serve as a cultural counterpart to Nehru's five-year plans. The intention of the Akademy was to hold "one seminar every four years for each of the arts of dance, drama, music, and film".

Predictably, in the immediate wave of post-independence nationalism, there was a definite drive among the participants to uphold the "Indianness" of Indian culture. Some of our most prominent artists and cultural figures, including Mulk Raj Anand, Kamaladevi Chattopadhyay, Balraj Sahni, Sombhu Mitra, and V Raghavan, pondered a wide spectrum of immediate problems. They included the ownership of theatres, censorship laws, the Dramatic Performances Control Act, entertainment tax, and almost as a secondary issue, the state of "folk drama".

One should remember that "folk theatre" had not yet become fashionable and that the models of "professionalism" in theatre continued to be European. Nonetheless, there was a fervent attempt in the seminar to confront "traditional" sources for the rejuvenation of our theatre. The most animated discussion in this regard was the one relating to *bhavai*, where the conflicting views of the participants reveal some of the deeply entrenched premises and problems underlying the urban construction and use of "folk theatre" in India today.

First of all, it becomes very clear from the discussion on *bhavai* (as from the seminar in general) that the Indian theatre had already become regionalised, with "experts" representing each state. The "folk drama" as a category had also been regionalised. No attempt was made in the seminar to situate the concept of the "folk" in a larger historical perspective—to see, for instance, how "folk forms" became vehicles for contemporary political content during the IPTA days, thereby revealing the innate urban assumption that the "folk" is not contemporary. Like a vessel, it has to be "filled" with new ideas and political content. Instead of questioning such assumptions, the participants of the seminar seemed to totally accept the validity of "folk drama" as an adequate category in which to confront the specificities of rural cultures in India.

Before proceeding with the discussion on *bhavai*, I believe it would be useful to reflect on the morphology of the term "folk" in the Indian theatre. Since the participants in the seminar did not question their use of this deceptively simple term, it is necessary for us to do so here.

It is not clear when the term "folk" entered the vocabulary of the Indian theatre worker. Certainly, it became popular during the IPTA movement when urban artists were compelled to discover their "roots" in rural cultures. What needs to be emphasised is that the "folk" has become an established category in the Indian theatre today. Actors and directors use it freely without questioning its obvious, yet diffused links to the word "people". Nor is it assumed to be a "foreign" word anymore so than "tradition", which is used more readily than the Indian equivalents of *parampara* or *sampradaya*.

Even in the academic world of folklore studies, it is significant that Indian equivalents, for "folklore" have been established only in recent years (Claus and Korom, 1988, p 32). The diffused use of the term "folk" in Indian contexts could be related to the fact that our established culture refused to accept it as a respectable object of study. As late as 1932, the Indian folklorist, Sarat Chandra Roy, had lamented the fact that "folklore" had not received the attention in India that "tradition" was beginning to receive in discussions conducted by the Indian Science Congress, the Oriental Conference, and the Bombay Historical Congress (ibid, p 31). Four years later, in 1936 when Chelat Achyutha Menon published *Ballads of North Malabar*, We are told that it was the first book of its kind in Kerala that "raised the subject in public estimation", by "persuading" the "educated Malayalee" that folk studies had a "place in the cultural life of the country" (Raghavan 1945, p ii).

In the context of the class and caste consciousness of the educated Indians, it is not surprising that the "folk" were associated not just with "people", but "common people". Perhaps, "peasant" was one of the closest associations with the word "folk" in its early history. Countering this history of prejudice, the IPTA movement glorified the "folk" in the context of the freedom struggle. The "folk" became emblematic of our "lost heritage" and "authentic history" that we were determined to reclaim from the British.

Along with the patriotic aura surrounding the "folk" in IPTA, there is also an inner tension underlying this word with specific reference to "people". In the initial phase of the IPTA movement, when it was only too easy for artists with vastly different economic and political backgrounds to subsume their differences under the immediate pressures and lure of patriotism, one could say that the "folk" and the "people" embraced each other's needs. But there was also an unspoken assumption that it was the "folk" who performed for the "people", not the other way around. We don't speak of the "folk" watching a "people's performance", it is "people" who watch a "folk performance"

Unavoidably, it was "people" who were viewed in a more corporal light; they were "flesh-and-blood" figures who constitute the "mass". The "folk", on the other hand, were inextricably linked to *forms—burrakatha, tamasha, nautanki*. Even today, I would argue that in the nebulous vocabulary of the Indian theatre artist, and his even vaguer social consciousness of his means of production, the "folk" has been disembodied from the needs of the "people". Quite literally, it has become a nomenclature for a wide range of supposedly non-urban performance traditions, that are primarily enjoyed by urban audiences.

Significantly, for those IPTA artists with a more politically active ideology (inevitably Marxist), who favoured a realist intervention in the arts modelled on Bijon Bhattacharya's *Nabanna*, it was the rhetoric of "the people" that dominated over the "folk". Not surprisingly, this group can be most strongly identfied with the Bengal front of the IPTA movement. If it is not too much of a witticism, I should emphasise that after independence, the "people" stayed on in West Bengal, while the "folk" eventually gravitated in the direction of New Delhi, which is the centre for all folk-related activities, including the handicrafts and the cottage industries. This is the centre where tradition is "invented", "manufactured", and "exported" with an increasingly efficient and centralised system. It is also the centre where definitions of "Indian culture" are made and disseminated.

* * *

To return to the Drama Seminar in New Delhi, one notes that "folk drama" was defined not so much through an analysis of the term (which was taken for granted), but through a debate as to how one should intervene in "folk culture". The underlying thrust of Dina Gandhi's address on *bhavai*, which provided the source of the debate on "folk drama", was not, "Why should we intervene?", but rather, "We must intervene now. How do we go about it?" Part of the problem with her suggestions, as with most urban recommendations for the "folk arts", is that she assumed an empathy with the folk artists, and then proceeded to represent them as if she were speaking on their behalf. In the process, her own use of these "folk forms" became confused with their "indigenous" state of being, which, she lamented, was in a state of decay, if not total extinction.

From Gandhi's address, it becomes obvious that her concern was not only for the "folk form" and its "extraordinary life-force", but for its artists who were going to be "wiped off due to neglect, unemployment, and actual starvation". ("Discussion on Bhavai", p 111). Instead of confronting this crisis through active involvement, however, Gandhi recommended "researches and studies" which could confirm that *bhavai* had "a definite contribution to make to our culture" (ibid). In retrospect, this priority given to research is problematic since

NOTICE

It is hereby notified for the information of the public that RPG PETROCHEM LTD, proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under:-

1.	Name and address of the applicant	RPG PETROCHEM LIMITED, 31, Netaji Subhas Road Calcutta - 700 001.
2.	Capital structure of the applicant organisation	: Authorised Capital Equity Share Capital — Rs 1,000 lakhs Issued, Subscribed and Paid-up capital Equity Share capital — Rs 130/-
3.	Management structure of the applicant organisation indicating the names of the Directors, including Managing/Whole-time Directors and Manager, if any:	: The applicant company is managed by a Board of Directors. The following are the Directors of the Company:- Mr. Sanjiv Goenka — Chairman Mr. R.P. Kanoria Mr. H.L. Sethia Mr. B.L. Chandak Mr. Rajeev Khaitan
4.	Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division	: The proposal relates to the establishment of an Export Oriented new Unit.
5.	Location of the new undertaking/unit/division	: Saidapet, District Chingleput, Tamil Nadu
6.	Capital structure of the proposed undertaking	: Equity Capital: Rs 168.00 crores.
7.	In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:	: -

Name of goods/articles	Licensed Capacity MT	Annual turn-over (Rs in crores)
(i) Ethylene	450,000	319.50
(ii) Propylene	225,000	119.80
(iii) Butadiene	80,000	68.16
(iv) Benzene	100,000	42.60
(v) Gasoline (High Octane)	200,000	51.12
(vi) CBFS	60,000	9.11
(vii) C-4 Raffinate	55,000	15.62
(viii) Fuel Gas (Hydrogen Rich)	60,000	5.54
		631.50

8.	In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc.	: Not Applicable
9.	Cost of the project	: Rs 840.00 crores
10.	Scheme of finance, indicating the amounts to be raised from each source	: Rs 168.00 crores through equity and the balance through borrowings from various sources.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

For RPG PETROCHEM LIMITED

it almost seems like a pre-condition before the *bhavai* artists can be "saved". Gandhi seems oblivious of the ironies involved in conflating the economic necessities of the *bhavai* performers with the need to develop their artistic potential. For her, the "sacred duty" of "emancipating" the folk artists could come about only through the organisation of a research centre, a training school for the traditional performers, and a careful study of *bhavai* texts, so that "spurious interpolations can be eliminated" (ibid).

Countering Gandhi's advocacy of intervention, the extremely sophisticated and westernised Alkazi then spoke up in the seminar for the people. "We want to educate the *bhavai* artists", he said. "But we do not for a moment consider that the nearer they reach us, the quicker would they discard the arts of their forefathers" (ibid, p 120). Then also, in response to the "so-called crudities and vulgarities" entering the *bhavai* form. he asked: "Should we be so prude and puritanic as to evaluate every art in the light of our own moral code?" (ibid, pp 120-21). More prosaically, he affirmed that "we should not poke our noses in this affair because we do not really know what would exactly be good for this form and for its exponents" (ibid, p 121). The job should be left to anthropologists.

Though, predictably, there was resistance to this suggestion—an anthropoligical intervention is scarcely less "neutral" than an artistic one—the debate between Gandhi and Alkazi does resonate even today, despite a sense of *deja vu*. We have heard their positions before in other post-independence contexts, and we continue to hear them even now. While Alkazi seemed to accept the inherent distance, culturally and socially, between the "urban" and the "folk" artist, thereby upholding his innate elitims, Gandhi wanted to bridge the gap in some meaningful way. Yet, this 'bridging" could scarcely be seen as altruistic. As Balraj Sahni pointed out, with reference to Gandhi's production of *Mena Gurjari*, which "contemporised" the folk form (notably by eliminating the male impersonation of women), these experiments in folk drama were a valuable source of growth for "our own [urban] theatre." All Gandhi wanted to do, according to Sahni, was to "revitalise her own art", and to retain as much of *bhavai's* "indigenous" qualities as "a sophisticated audience would be able to appreciate" (ibid, p 122).

This is about the most honest statement that one could hope to find about the urban use of form forms. Let us acknowledge that this "use" is more useful to the urban artist than to the "folk" who inspired the creation. "Folk drama" is essentially an urban construct that cannot claim to be entirely "indigenous" (and therefore, "authentic"). It is a simulation of the "folk form", sufficiently "indigenous" (yet not entirely *desi*) to win the approval of urban audiences. The clientele of "folk drama" is not the "folk", but city people who need to be reminded of their "roots" and "native places" from which they are irrevocably displaced.

* * *

YAKSHARANGA: A CASE STUDY

Among the few inventions of performance traditions that have been acknowledged as "inventions" rather than "reconstructions", which have been specifically made with urban audiences in mind, one must include Shivaram Karanth's creation of Yaksharanga. This can best be described as a balletic, "unified music-cum-dance form", adapted from Yakshagana, the most popular traditional form of Karnataka. The impulse that led to the invention of this form and the cultural assumptions underlying it, are worth examining in detail, even though Yaksharanga may not be particularly memorable in itself. Nor has it contributed to the rejuvenation of Yakshagana at large. Rather, it can be most accurately examined as an individual response to a particular tradition that Karanth himself would prefer to see as 'a creative extension of the traditonal form" (Rea 1978, p 59).

However, as the very alternation of the word implies, Yaksharanga is not an organic development of Yakshagana. Karanth has *selected* those aspects of the tradition that are most meaningful to him, to which he has added his own contributions and manipulations. In his experiment, one realises the validity of Raymond Williams' acute observation about "tradition", namely that it represents "a selection and reselection of those significant received and recovered elements of the past which represent not a necessary but a desired continuity (Williams 1981, p 187).

One could say that Karanth's Yaksharanga is the manifestation of his "desire" to see Yakshagana within the contours of his vision. However, when he first started his research, it was neither arbitrary nor entirely subjective. He needed to authenticate the history of Yakshagana before extending or deviating from its principles. His passionate search for old manuscripts and *prasangas* (narratives), meetings with gurus and musicians, eventually culminated in a seminal thesis on Bayalata, which literally means "open-air plays", and which serves as a nomenclature for a wide range of forms relating to Yakshagana. Through his study, Karanth was able to contribute important perspectives on *raga, tala*, costumes, and stagecraft. But this expertise did not compel him to "reconstruct" Yakshagana in an antiquarian mode. Rather, it stimulated him to find points of departure for the performance of Yakshagana as he envisioned it in our world today.

This impulse to confront tradition in order to concretise a personal vision in a rarity in the contemporary Indian theatre. One may not agree with Karanth's choices, but one cannot deny the intensity of his convictions. At a time when tradition is generally regarded with difference or the most abject deference, it is heartening to hear the "rebellious"voice of an octogenarian.

> To me, tradition is no dead corpse, merely to be worshipped for its own sake. Like language, it has to acquire, when necessary, new words and new meanings, while many old words will naturally be lost... For any change to be valid, its nature has to be relevant to its content. Form and content go together. Yakshagana is no exception.

It was by redefining the "content" of Yakshagana that Karanth was compelled to make some of his most controversial changes.

Significantly, he did not merely locate this "content" in the *prasangas* sung by the *bhagavata* ("the first person"), but in the "rhythmic content" embedded in Yakshagana's intricate footwork and "walks". His purpose was to find appropriate links between the "emotional content" of the *vacika* (speech) and the "rhythmic content" of the *angika*, (body) which are normally kept apart. Any element that interfered with this "unifying" impulse was summarily discarded.

In order to ensure "a harmonious aesthetic experience," Karanth made one of his most radical and controversial choices: he eliminated the improvised dialogues between the actors, which may be one of the most popular elements in "traditional" performances of Yakshagana today. Karanth felt that the transition from music to prose created an "unbridgeable gap", resulting in "dissonance, disharmony, non-art" (Rea 1978, p 60). Though this perception is precise, its assumptions are questionable. Certainly, there is a break when the *bhagavata's* third-person narrative is interrupted by the first-person exchanges between the actors. But this "dissonance", this shift in voices, one could argue, is what gives Yakshagana its theatrical immediacy, its jolting momentum. Nor is it entirely accurate to say that the narrative and the dialogue "duplicate" each other. Apart from the significant differences in *utterance* of the *bhagavata* and the actors, the latter elaborate on the details in the *prasanga* in response to the immediate performance situation.

Of course, this element of improvisation (intrinsic to all "folk" traditions) is precisely what Karanth distrusts. He finds the verbosity of the actors "tasteless" and "monotonous". What is perhaps at stake in his disapproval of the actor's licence is that he, as a director, can have no control over it. It is obvious that despite his reinstatement of the *bhagavata* (who traditionally functions as a "director" *during* the performance itself), Karanth is not prepared to relinquish his own power as a director, both on stage and during the rehearsals. In this regard, it is well known that he directs in the "tyrannical" tradition, kicking and slapping his actors if they fail to match his energy. Though his personal limitations as a dancer and confusion of *tala* are also well known, no one has the guts to question his pedagogy. Besides, his passion for the art is strong and infectious, and most artists have no choice but to submit to it.

What would have happened, however, if Karanth's energies could have been match-

ed by legendary artists like Sreni Gopalkrishnana Bhatt? It appears that during one performance while playing Ravana, Bhatt interrupted the Bhagavata on his very first question—"Are you justified in abducting Sita?"—and spent the entire night *justifying* Ravana's act with the most sophisticated legal casuistry (Kambar, p 3). Surely, the elimination of this vocal *tour de force* in favour of "aesthetic harmony" would have been a loss.

One is compelled to question whether "harmony" is an adequate compensation for the rough and immediate communication that takes place between actors and spectators during the dialogues. Instead of exposing the "joints" of Yakshagana, risking the possibilities of interruption from the audience, Karanth settled from seamlessness in the good, old-fashioned tradition of bourgeois art. In this structure of representation, everything works out as planned because there are no risks. The director provides "harmony" on all levels of the production. The actors are free only within his constraints.

Apart from his own directorial constraints, to which he seems oblivious, Karanth accepts the limits of the proscenium theatre. He also endorses the cultural associations of such spaces, which determine (among other factors) the duration of a performance. Instead of an all-night, open-air, tent-performance of Yakshagana, where the performance is just a part of many other activities including eating, gossiping, chewing *paan*, and sleeping, Karanth accepts that a three-hour, proscenium presentation of Yaksharanga is perfectly adequate for an appreciation of its subtleties. His purpose is to produce neither an "authentic" Yakshagana nor a "tourist show", but a well-made ballet that is tightly co-ordinated, accessible, and eminently exportable.

In this content, one cannot deny that Karanth's structural changes in Yakshagana have been made with foreign audiences in mind. For instance, the high pitch of the *bhagavata's* songs has been lowered so that it is now more congenial to western ears. The inclusion of a saxophone and a violin have also enhanced the overall "harmony" of the musical score. In addition, of course, the dialogue has been eliminated, thereby removing the possibility of alienating non-Kannada speaking audiences.

Ironically, there has been a counter-move to Karanth's changes by Martha Ashton, the American "expert" on Yakshagana, who has favoured a more "traditional" representation of the performing art with all its accessories and dialogue. At one level, she is more "authentic" than Karanth, though her knowledge of Yakshagana is derivative (Karanth himself guided her doctoral dissertation on the subject). Though her awareness of Kannada culture cannot be compared to Karanth's prodigious knowledge of his state, which encompasses not just the arts and literature but geology, botany, architecture, and science, as well, Ashton has become the "authentic" representative of Yakshagana abroad while Karanth remains something of an "anti- traditionalist" in his own home.

At this point, I should emphasise that the essential limitation of Yaksharanga does not lie in its apparent "inauthenticity", but in its construction and acceptance of an aesthetic that invites passive consumption. Like other urban re-envisionings of "folk forms", Karanth's experiment seems to have diluted rather than strengthened the energies of the "folk". It is particularly sad in this regard that no one has challenged Karanth's work through another experiment. One should accept that all experiments with traditional forms are necessarily partial and incomplete. They need to be questioned and extended by other artists, not through polemics or "reform", but through further explorations that continue where the first experiment left off. Our tragedy in India is not that there are iconoclasts like Karanth who "do what they want" in accordance to the inner necessities of their vision, but that there are not more people like him, who can "invent" tradition with a consciousness rooted in the immediacies of their lives.

Instead of generating more experiments, however, Yaksharanga has merely bureaucratised its practice through numerous tours and official performances that have been advertised with all the hype one associates with our burgeoning cultural trade. This bureaucratisation has been masterminded by Haridas Bhatt, who has a formidable talent (by Indian standards) to promote the performing arts through printed matter—booklets, brochures, leaflets with catchy captions like "Yakshagana Goes to Japan", "Bon Voyage from Chief Minister", and "Pride of Karnataka".

To highlight some of the assumptions underlying Bhatt's salesmanship, a quote from one of his articles will do.

> During the years 1975-78, the Yakshagana gave nearly 155 performances in six states of India—right from Meghalaya to the southern most Tamil Nadu and thrilled thousands of enlightened art-lovers. A French artist after observing the *Naladamayanthi* of Yakshagana opined that this was the very best variety of contemporary dance-drama forms of India. The national dailies of Bombay and Madras wrote in no uncertain terms about the artistic superiority of the form. Scholars who known the secrets of the world theatre forms have declare that Karanth's creation can certainly place Yakshagana in a still more elevated position in world theatre.
>
> As I was in charge of managing "Yaksharanga" in its tours of other states of India and abroad, I have seen the impact that this theatre form makes on audiences everywhere. Unlike other classical dance-drama styles this folk form (which is also semi-classical) is verily the theatre for all. (Bhatt, p 9).

Unavoidably, one is struck by Bhatt's need to confirm Yakshagana's worth through foreign endorsements and the standards of "world theatre". Also to be noted is his scarcely concealed chauvinism in asserting Yakshagana's "artistic superiority" over other traditional forms in India. As for Yaksharanga, it is the "theatre for all".

While criticising Bhatt's reduction of art to public relations, one should also acknowledge that the very accessibility of Yaksharanga has lent itself to a process of commodification. The sad reality, however, is that there was much thought and passion in Karanth's experiment that have failed to resist commercial pressures. Once again, bureaucracy has proved to be stronger than art. And consequently, Yaksharanga has no alternative but to petrify into another "form," without inspiring any significant change either in Yakshagana itself or the use of "folk forms" in the Indian theatre today.

The Theatre of Roots

Despite its limitations, Yaksharanga is at least an intelligible form related to a traditional performance. In contrast, most experiments of "tradition" in the contemporary Indian theatre have merely borrowed a stock of techniques and conventions, which have been recycled in a rather facile and decorative manner. Though many of our "tradition-inspired" and "folk" productions have been entertaining and visually pleasing, they have totally failed, in my view, to contextualise their borrowings in a responsible manner. Nonetheless, they have gained a tremendous respectability and official recognition over the years. In fact, they have even been formally categorised by Suresh Awasthi, one of their most ardent supporters, as belonging to the "theatre of roots," in which he includes our most established artists like Habib Tanvir, B V Karanth, Ratan Thiyyam, K N Pannikkar, and younger directors like M Ramaswamy and Kartick Awasthi.

It would not be irrelevant to examine how this "tradition-inspired" theatre corresponds to the rise and fall of Awasthi as an important cultural official in New Delhi. In fact, he charts his own role in the development of this theatre in his rather simplistic "Defence of the Theatre of Roots" in a special issue on the subject published by *Sangeet Natak*. Significantly, during the First Drama Seminar (which I discussed earlier), where Awasthi had presented a

paper on folk forms in the Hindi-speaking region, he had not been particularly vociferous. This was the period shortly before Alkazi had taken over as director of the National School of Drama, where the Indian theatre would have to be "professionalised" (in the tradition of RADA) before it could become "indigenous".

Even in 1961, when Awasthi had organised a national seminar on "Contemporary Playwriting and Play Production" as the general secretary of the Bharatiya Natya Sangha, he claims in his "Defence" that he was dubbed a "revivalist" for promoting ideas relating to the "relevance" of traditional forms. Between 1965-1975, however, when Awasthi served as the general secretary of the more prestigious Sangeet Natak Akademy, he had more power to organise performances, festivals, seminars, and exhibitions, primarily in New Delhi. A notable meeting was the "National Roundtable on Contemporary Relevance of Traditional Theatre" in 1971, by which time the so-called "new theatre" had already established "greater confidence and vigour" (Awasthi 1985, p 87).

Perhaps, this was the hey-day of both the "theatre of roots" and Awasthi's career, which has involved the dissemination of "traditional Indian theatre" to far flung countries like Japan, Greece, and the United States. Today, however, after his brief tenure as the chairman of the National School of Drama and his removal from the limelight as it were, the "theatre of roots" has acquired the status of a rather tired slogan commemorating a "movement" that has come full circle.

* * *

From Awasthi's "Defence", it becomes clear that he thinks about "tradition" through dichotomies and the most generalised categories. Invariably, the "theatre of roots" is set up against the "western realistic theatre", which forms part of our "decadent" cultural inheritance. By turning to our "roots", it appears that our artists have been able to "reverse the colonial course of contemporary theatre and put it back on the track of the great *Natyasastra* tradition" (ibid, p 85). The fact that "realism" might have inspired Indian narratives, histrionics, and performance structures, as in the vibrant and profoundly Indian "company theatre" traditions to be found all over the country, is a reality that Awasthi does not seem to consider. What matters is to establish a direct line with the *Natyasastra* itself. Only then, or so Awasthi implies, is it possible to be authentically Indian.

"Is there *an* authentic Indian tradition?": this most pertinent question is raised by Anuradha Kapur in her study of the Ramlila. For Kapur, "authenticity" is a category of thought intrinsically linked to post-colonial pre-occupations with "identity" and "roots", which are themselves constrained within the polarities of east and west (Kapur 1988, p 5). By setting up our tradition as "true" against the encroachments of a "foreign" culture, we "manufacture" a history of tradition that is "basically moulded by the west insofar as it is posited as its exact alterity" (ibid, p 6). Rather like the orientalists of Europe who saw mythical points of origin in the languages and philosophies of the "distant East", we too "orientalise" our past by refusing to confront the mutations of our history. We prefer the mythical sanction for *Natyasastra* to an examination of the contradictions, details, and interpenetrations of our multilingual, multicultural society.

One searches in vain for some self-questioning in Awasthi's "Defence", only to confront generalities. We are told, for instance, that one of the distinguishing features of the "theatre of roots" concerns the "rejection of the proscenium". Apart from padding this section with totally gratuitous references to Badal Sircar and E Alkazi, who most emphatically do not belong to this tradition, Awasthi includes his two primary representatives, K N Pannikkar and Ratan Thiyyam, who have not worked in predominantly non-proscenium conditions. Where are the theatres in India to support these conditions? Thiyyam's theatre, I would say, has been strongly influenced, if not constrained by his exposure to the proscenium theatre, as represented to him by his mentor, Alkazi, at the National School of Drama. His framing of action, timing of exits and entrances, lateral groupings, use of the cyclorama, and above all, his tacit refusal to confront the audience with breaks in the narrative or direct addresses—these are conventions that strongly uphold the illusion of the "fourth wall".

When Thiyyam has worked outside of the proscenium, it has been for "non-traditional" plays like *Imphal Imphal*, which has been structured on the lines of Sircar's Third Theatre. Neither Pannikkar nor Thiyyam, to my mind, has found ways of altering the angles of perception from which their productions have to be viewed, and therefore, Awasthi's superficial allusions to traditional practises like *pradakshina* (circumambulation of the temple) are totally out of context. So also are his references to the interminglings of the "performance space" and the "audience space", which belong to the environments of the Ramlila rather than to the proscenium-bound spectacle of the "theatre of roots", where the seats and the stage are 'rooted" to the ground.

The second generalisation that distinguishes (or rather, obfuscates) the "theatre of roots" is "stylisation". Without attempting to define this most nebulous of terms, Awasthi claims that it has brought about a "revolutionary change" in the art of the actor and the transformation of the "dramatic text" into the "performance text". In contrast to "realistic theatre", the impact of staging signs in the "stylised theatre" is "maximised and their number multiplied" (Awasthi 1985, p 89). It doesn't help to be told that the "plasticity" of stylisation is to be found not only in Koodiyattam and Kathakali, but in "the Ajanta murals and the sculptural tradition" as well (ibid p 92). ("Sculptural tradition"? Of what?) As if these pan-Indian, interdisciplinary references were not enough, Awasthi includes pan-Asian references to Noh and Kabuki to enhance the authenticity of his "theatre roots".

One tires of Awasthis interminal capacity to list "traditional" elements l half-curtains, head-dresses, "stirring" ex and entrances that reduce "the *Natyasas* tradition" to a pitiful parody. How, for i stance, does it help to be told that Panikk uses the "sing-song delivery of Koodiyatar or that he "follows traditional theatre a *Natyasastra* prescription" by making Bhir and Ghatotkacha enter to the accompar ment of drums" (ibid, p 97). Or th Ramaswamy's chorus in *Antigone* danc "beautifully" because the movements of t traditional dancers were based on the ritu dance Devarattam? I mean: *Why* Devara tam? Surely there must be some link betwe the inner energy of Devarattam's movemen that illuminates the text of *Antigone* in son specific way. We cannot simply turn "traditional forms" because of the "beauty" or "stylisation" or "sculpturesq quality". *What do they mean to us?*

This mindless simplification of "forms has been shaped and endorsed by the offici sanction given to the decontextualisation o tradition in our theatre today. If institution like the Sangeet Natak Akademy were le interested in "forms" and more concerne about the historical impulses and mutatior underlying these forms, our young genera tion of theatre people would not be so los And yet, how can one blame them if th most illustrious representatives of "trad tion" in contemporary theatre fail to que tion their own simplicities?

Even in the productions of Thiyyam an Panikkar, in whose craftsmanship there much to admire, I, for one, am left hunge ing for content, for some link to our worl that accentuates the turmoil and contradic tion, the pain that these very artists mus have suffered as "tradition-inspired Indians, who are nonetheless alive in Raji Gandhi"'s India. Strangely enough, it is i traditional performances that one is mor likely to find this link than in the so-calle contemporary productions of the "theatr of roots".

When I see Abhimanyu in a Terukkut performance flogged to death with handkerchief—each flick resulting in dismembering of his limbs—juxtaposed wit elegiac refrains in which the world mourn for his untimely death, I am strangely alerte to the banality of violence in our everyda lives. Perhaps, this is an "impure" reaction but it feels more valid to me than th passivity I succumb to while watchin Abhimanyu die in Thiyyam's production o *Chakravyuha*. Here in this picture-frame where grief is so beautifully modulated, I an left unconvinced by the representation. Wha resonates is the craft of the proscenium tradition dressed with the trappings o ethnicity.

Obviously, our Abhimanyu cannot be th crude, farcical genius of a performer i Terukkutu, whose very form embodies th mythical reality of the character. We nee to create our own forms for Abhimanyu today in accordance to our perception o what he means to us today. We can do thi

not by imitating traditional performances or seeking a false lineage with the past, but rather, by confronting the tradition *in* us that has been dislocated, fractured, reassembled, and transformed through layers and dissimulations of our history.

We need to reject the easy inheritance implied through categories like the "theatre of roots", and accept Eliot's stern (yet curiously valid) advice that, tradition can be obtained only through "great labour". This involves a cultivation of the "historical sense", which provides "a perception, not only of the pastness of the past, but of its presence" (Eliot 1969, p 49). This "presence" must live in the indissolubility of form and content in our theatrical representations, which today is merely assumed, without being fully suffered or questioned.

To our "traditional theatre", we must pay respect, not to sentimentalise its "secrets" or out of false reverence, but to acknowledge that it has already absorbed our future in its presence. For us, I believe, it is not a question of returning to tradition, but rather, of catching up with its immediacies. incarnated through eternal ever-changing truth.

BEGINNINGS

There are two images from our mythological tradition that seem relevant to this discussion, or rather, my need to intervene in its history. At one level, the images are quite unrelated, separated by narrative and time—one is from the *Mahabharata*, the other from the Punjabi legend of Puran Bhagat. And yet, at a subterranean level, these images are united through their advocacy of what I must call "violence". Today, we could do with some of this "violence" in our suffocatingly safe theatre.

In the *Mahabharata*, there is that memorable moment when Yudhishtira receives permission from Bhishma to kill him. The "father" legitimises his own death at the hands of his "son". Violence receives a paternalistic, if not divine sanction. It is now Yudhishtira's *dharma* to kill Bhishma.

There is a different kind of violence in the story of Puran Bhagat, which does not involve killing, but rather, a rejection of the father and whatever he represents—family, kingdom, state, authority, love. After being incarcerated in a dungeon for the first tweleve years of his life, then exiled, and later imprisoned, Puran Bhagat goes through many trials and humiliations before he acquires the self-realisation of a *yogi*. In the final episode, when his father begs him to take over the kingdom, Puran rejects the offer: "If you cannot govern your kingdom, let it go to the dogs...I will have none of you and your belongings. I am a *yogi*. I must go" (Gill 1986, p 146). And he *leaves* without any attempt to reconcile differences or to affirm traditional ties.

In Puran's exit, one finds a paradigm of rejection. I do not believe that there is a single artist in the Indian theatre today who is prepared to "reject" tradition as resolutely as Puran turns away from his father and inheritance. Perhaps, this is a totally unfair demand on my part. Maybe our artists are still too close to "tradition" (or whatever they make of it) to dissociate themselves from its hold in order to pursue their own journeys in theatre.

At the same time, they do not believe that they have the right to "kill" tradition with as much respect and fervour as Yudhishtira kills Bhishma Perhaps, they have not yet received the inner sanction to fulfil this necessary task. It is safer, therefore, for them to fold their hands and deify tradition, perpetuating deference and cowardice.

Unable to "reject" or "kill" (which, in artistic terms, would involve a subversion of the "traditional form"), our theatre artists remain in limbo. They don't know how to free themselves from tradition or live with it without compromising on their own truth. In the meantime, they "invent" tradition not so much from an inner necessity, but in deference to larger cultural and political factors that favour a sanctification or dressing-up of the past.

It is time to end this facile use of our tradition. Instead of bothering with the minutiae of hand-held curtains, masks, make-believe *poorvarangas*, and stirring exits and entrances to throbbing drums, we need to ask ourselves some crucial questions: *What is our sacrifice in theatre today? Who are we performing for in the absence of gods? Who are the new vighnas who have to be fought and killed on stage? How can we transform ourselves through theatre? What are we celebrating on stage?*

I ask these questions not because I have the answers, but because they seem necessary to begin a confrontation with tradition that could transcend its "inventions" in our theatre today.

Growth Performance of Indian Electronics under Liberalisation

K J Joseph

The Indian electronics industry is still in a nascent stage of development, contributing less than five per cent of the country's industrial output. However, in the recent years there has been an apparent improvement in the growth of output of this industry. The present study is an attempt towards analysing this growth performance in terms of structural changes and impact on different facets of industrial growth: income, employment and foreign exchange.

THERE is an increasing recognition that industrial growth in India has picked up in the eighties in contrast with the stagnation since mid-sixties.[1] The growth revival is generally attributed to the greater play of market forces consequent upon the government's 'New Economic Policy', which introduced an environment of liberalisation as against the earlier 'regime' of controls. A priori, liberalisation policies would achieve a higher growth rate *inter alia* by industrial restructuring and diversification: production of such industrial goods as the market forces determine would expand. The improvement in the overall industrial growth would be the result of the rapid growth of certain industries, and not necessarily across the board. In fact, the statistical evidence put forth in substantiation of higher industrial growth in the eighties is based on the revised index of industrial production (with 1980-81=100) wherein a higher weightage is given to such 'sunrise' industries as electronics, petrochemicals and automobiles.[2] These new industries are the major ingredients of the growth recipe and among them electronics is the fastest growing one. Electronics industry produces not only products that are in the nature of consumer goods but its products are processes in other industries; hence it has higher linkages with rest of the economy. Thus electronics plays a major role in the restructuring of the industrial sector. Therefore, it will be timely from the policy perspective to have a close look at the growth performance of this industry. The present study is an attempt towards analysing the growth performance of Indian electronics industry in terms of structural changes and impact on different facets of industrial growth: income, employment and foreign exchange.

The Policy Background

Although the genesis of electronics industry in India can be traced back to the early 1950s, a concerted effort towards its development on modern lines was made only when the state came forward in the early 1970s and set up the Department of Electronics (DoE) and Electronics Commission. The underlying strategy, in the initial years, was aimed at the development of a balanced and self-reliant industry to meet the domestic requirements with a major role assigned to the public sector and small scale sector with little recourse to foreign capital and technology. In nutshell, the Indian electronics strategy, in accordance with the then general industrial strategy aimed at import substituting, self-reliant and public sector led growth.

The government gradually tended towards the view that the overemphasis on regulatory mechanisms acted as a stumbling block to the growth of the industry. In terms of the recommendations of the Sondhi Committee[3] and in keeping with the general trend towards liberalisation in the early 1980s, a series of policy initiatives were announced. These included (a) a policy on electronics components (1981), (b) industrial and licensing policy for colour television (February 1983), (c) specific measures to further accelerate the rapid development of electronics (August 1983), (d) relaxation of the 100 per cent reservation of the telecommunication sub-sector in the public sector (March 1984), (e) a new computer policy (November 1984), (f) integrated policy measures in electronics (March 1985) (g) a computer software policy (December 1987). In addition to these major policy measures there were a number of short-term measures which exerted a significant impact on the growth of the industry. In general, these policy measures now shifted the industry from a regime of government controls and regulations to a liberalised one wherein emphasis is laid on minimum viable capacity, scale economics, easier access to foreign technology, relatively free entry to the private sector (including monopoly houses and FERA companies), with a view to make the industry modern, cost effective and competitive.

Thus, there are two distinct policy phases in the development of Indian electronics industry, viz, in pre-liberalisation (before 1980) and post-liberalisation (after 1980). We propose to analyse growth performance of the industry against the background of these policy phases.

Growth Trends

The policy changes in the eighties had its impact on the growth and structure of the industry. To illustrate, while the industry had grown (current prices) at an annual compound growth rate of 18 per cent during 1971-80, the recorded growth rate during the post-1980 period was as high as 33 per cent (see Table 1). This is found to be even higher than the growth rate achieved by South Korea during the period 1980-85.[4]

The analysis of growth rate in current prices as has been done here may be objected to. There is the major problem of not accounting for the price changes. The studies by BICP[5] and World Bank[6] have made use of the wholesale price index and worked out real growth rate at constant prices. If such a procedure is employed, the growth rate is less impressive though the post-1980 period still showed a pick up in growth rate. Nevertheless a firm conclusion is not warranted. There are serious problems in deflating output at current prices by using the wholesale price index. To illustrate, the electronic products are not adequately represented in the wholesale price index. Prices and price-performance ratios of electronics products had declined during the period under review.

Trend in Prices: A Digression

Therefore, we made an attempt at developing an implicit price index for the electronics industry. For this purpose we collected the data on quantity and value of 151 products covering different product groups. The price of different products calculated from the above was weighted with their respective shares. The implicit deflator thus developed could not be extended before 1981 as the item wise data on production and value were not available for those years.

The implicit deflator showed that there was a general decline in the real price of electronics products especially since 1983. The general price index for electronics (with 1981=100) has declined to 82.59 in 1986, though 1987 witnessed an increase to 95.72. However, there were variations across different products and product groups. The price index for the major sub-sectors, viz, consumer electronics, professional electronics and components, was also subjected to price decline (see the graph). The price decline was more pronounced in the consumer electronics, where the declining trend started in 1982. What is common to all sub-sectors is that 1987 seems to be a turning point where an upward trend in prices seems to have set in.

The general decline in prices, as we will see later in this section, has to be viewed against the increased competition as a result of liberalisation leading to reduction in barriers to entry. This is evident from the increase in the number of firms in different

oducts (see Table 2). The increasing competition and the consequent reduction in ice could be illustrated with the case of rsonal computers.

Personal computers (PC) were first introiced in the country by Minicomp, a ombay based firm, in 1984 at a price of er Rs 1.2 lakh. The next two years witness- a price war by the leading producers. By e mid-1985 Usha Microprocessors, a Delhi ised firm brought the price down to less an one lakh rupees. HCL followed the suit bringing it further down to Rs 0.8 lakh. ne price declined further to Rs 0.5 lakh ith the entry of Wipro in early 1986. Competition became intense with the entry of erling Electronics which slashed the prices rther down to Rs 0.30 lakh. The price war ems to have ended when HCL, the present ader offered a PC with its minimum conguration (2 floppies, 256 Kb memory, 5.77 IHZ clock speed) at a price of Rs 20,000. hus the price dropped by nearly 83 per cent two years. However, during 1987 the price as been relatively stable either because the rms are reluctant to lower their margins or ecause they have formed the cartel. The ineasing concentration ratio in 1987 as comared to 1983 for different products (see able 3) has to be viewed against this ackground.

To have a comparative picture of the imact of price changes on output we have eveloped two series of output at constant rices using wholesale price index and imlicit deflator respectively (see Table 4). uring 1981-87 the output at current prices icreased at an annual compound growth ate of nearly 33 per cent, where as at consant prices, using wholesale price index, the rowth rate was only 25 per cent. On the ther hand, with implicit deflator the growth ate is marginally higher than what was bserved at current prices. This leads to the onclusion that the wholesale price index ailed to capture the price reduction which ne electronics industry was subjected to.

Viewed thus, the real output growth in ndian electronics industry was remarkably igher in the eighties. Hence the output at urrent prices could be considered as a easonable approximation of its real growth ver the period under consideration.

GROWTH PERFORMANCE: A SECTORAL ANALYSIS

So far we were focusing on the total utput of the industry. Electronics industry onsists of a number of product groups. On he basis of the technical specificity of the roducts one can divide them into equipnent and components. It is also possible to roup them according to the level of techology embodied in them.[7] However in rder to capture their differential impact on rowth of the industry, it is preferable to livide them into three broad product groups, iz, consumer electronics, professional electronics and components. This corresponds o the broad use pattern and consequently the consumption demand is entirely different. More importantly, the nature of demand generated by these product groups differs in terms of their forward and backward linkages.

During 1970s the three sub-sectors, viz, consumer, professional and components have grown in a balanced manner with the respective growth rates being 17 per cent, 20 per cent and 17 per cent (see Table 5). However, professional electronics had a dominant share in total production. As professional electronics is generally viewed as being more technology intensive, some studies have attributed this dominance of professional electronics to represent the higher technological capability of Indian electronics as compared to Newly Industrialising Countries (NICs).[8] The above growth pattern has to be viewed against the background of the strategy of achieving a balanced growth in an integrated manner. Accordingly the capacity creation for the component sector was planned on a derivative basis of the defined requirements of the equipment sector.

In the post-1980 period, the highest growth rate was observed in consumer electronics (nearly 40 per cent) followed by professional electronics (31 per cent) and components (26 per cent). The unprecedented growth of the consumer electronics sector was contributed mostly by television receivers. The share of TV in the consumer electronics sub-sector increased from 36 per cent in 1981 to 71 per cent in 1987 by registering 66 per cent growth. More importantly, at present the share of this single item in the total electronics output is as high as 28 per cent.

The professional electronics sector consists of the following broad product groups, viz, telecommunication, defence, computers and control instrumentation. The growth of this sector especially the latter two depends on the demand forthcoming from other industrial and service sectors of the economy and hence the diffusion of the electronics technology to other sectors. As we have already noted, during seventies it was the fastest growing sector of electronics with largest share in total production. In fact, it is this dominance of professional electronics and broad base of the industry that differentiated Indian electronics from those of NICs.

Among professional electronics, computers, control instrumentation and industrial electronics were the fastest growing sectors during seventies. But under the liberalisation of eighties, while the computers marked a still higher growth rate, the rate of growth of control instrumentation and industrial electronics remained almost stagnant. Given the diversified industrial structure and the extent of replacement investment taking place in the Indian industrial sector one could have, naturally, expected a higher growth of the sector during 1980s. The reason for not achieving a commensurate growth as compared to other sectors seems not so much due to constraints in the diffusion of electronics technology into the industrial sector but the inability of the electronics sector to meet the increasing demand and therefore leading to imports.

The discussion so far reveals that in the post-1980 period the equipment sector as a whole registered a marked improvement in growth. The moot question here is how did the component sector, the building block of the industry, behave when the equipment sector was on a higher growth path? The component sector in the country consists mostly of consumer grade components (see Table 6). In the post-1980 period not only did the growth of components lag behind other sectors but its share in total production also declined from 20 per cent to 15 per cent. This decline was not due to a shift in the composition of component sub-sector from consumer grade to professional grade components. Indeed, the share of professional grade components declined. Thus the higher growth of electronics in the post-1980 period

TABLE 1: OUTPUT AND GROWTH RATES OF THE ELECTRONICS INDUSTRY AT CURRENT AND CONSTANT PRICES: 1981-87

(Rs crore)

Year	Current Prices	Constant Prices

was at the cost of an intersectoral imbalance. More importantly, the growth was concen trated around a few products. To illustrate, in each sub-sector there was a single product which contributed to most of its production. Thus there are three products (TV in consumer electronics, computer in professional electronics and electron tubes in components) accounting for nearly 40 per cent of

the production, mainly contributed to the growth in the liberalised regime (see Table 6).

The above discussion reveals that the Indian electronic industry during the liberalisation regime developed a lopsided product structure wherein the component sector accorded less priority appears to be contradictory in view of the sustained and self-reliant growth of the industry. With an extreme disjuncture in the growth pattern of equipment sector with component, the dependence on imports would have increased over time (we will come back to this question in the next section).

The emergence of the lopsided product structure has to be viewed against the changing organisation structure of the industry wherein the private sector is playing an increasing role. It is evident that during the post-1980 period the role of private sector increased considerably and that of public sector and small-scale sector reduced (see Table 7). Incidentally, the available evidence shows that the private sector has been investing mainly in consumer electronics. To illustrate, while the share of organised private sector in total production increased only by 7 per cent during 1981-1987 their share in consumer electronics increased by 10 per cent. The preference of the private sector towards consumer electronics and such other less capital intensive and quick yielding areas is clearly stated by the Planning Commission. To quote "...much of the investment by the private sector in the last two years is in the areas of consumer electronics, petrochemicals and automotive sector. However, investment is not forthcoming in the higher priority activities where large investment and technological efforts are required. Investment in consumer products based largely on imported and penultimate stage raw materials seem attractive

Total	(100.0)	(100.0)

Note: Figures in the parenthesis shows share

because of lower capital costs and quick returns."[9]

Incidentally, the approach of the organised private sector towards the development of this industry and their role as envisaged by them stands as a testimony to the above statement by the Planning Commission. This is evident from the views expressed by the socalled upstart entrepreneurs in a workshop organised by the AIEI in 1979. Even at the cost of brevity it would be insightful to reproduce some of the views and suggestions put forward by them. It was held that "...we should develop first the equipment base... built on imported components. In response to this increased demand the component manufactures will come forward."[10] However, while suggesting this strategy of "growth through shortage" they also felt that "components is highly capital intensive industry... an area in which private sector will not be able to contribute much... and therefore, we will have to think in terms of making investments either in the state sector organisations or in the public sector".[11]

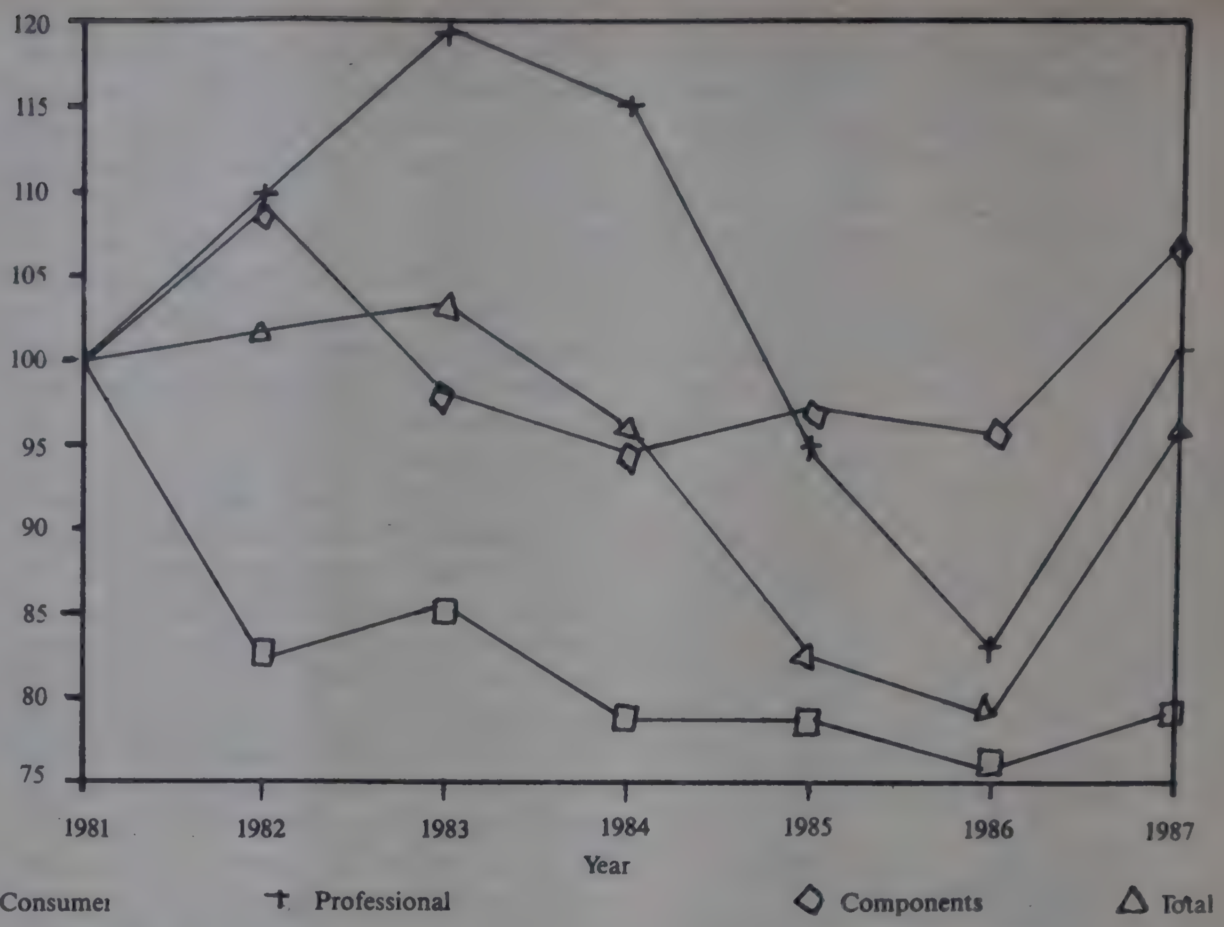
Thus far we have argued that when the strategy towards electronics industry shifted from the controlled to the liberalised regime with greater play of market forces and increasing role to the private sector, the output growth of the industry improved considerably. However, the component sector being more capital intensive,[12] the investment by the private sector was directed mostly to the less capital intensive products based on imported and penultimate stage raw materials. This made the product structure less integrated and lopsided. What impact this lopsided product structure, wherein equipment are made out of imported kits, had on the domestic value added of the industry? It is to this question that we turn now.

Contribution to Value Added

The lopsided product structure would have had its impact on value addition capability of the industry which is, in fact, the real indicator by which the contribution of any sector to the economy could be gauged.

Our analysis of the trend in value added is based on the data obtained from Annual Survey of Industries (Factory Sector).[13] With a view to highlight the income generation capability of the industry we have calculated the share of net value added in total production. There was a general decline in its share across different sub-sectors (see Table 8). The share of value added in total production declined from nearly 33 per cent during 1975-80 to 29 per cent in 1981-84 period. This decline is found to be more drastic in consumer electronics[14] where it has declined by five percentage points followed by components. This has to be viewed against the shift in national policy towards liberal imports of components and equipment in general and CKD/SKD kits.

Figure: Price Movement



Employment Effect

The lopsided product structure had its impact beyond lower value addition of the industry. It is related to the employment generation capability of the industry. It is generally held that the employment generation capacity of electronics is much higher than other industries (see Table 9). As the Sondhi Committee has observed "with a large reservoir of skilled manpower supported by a high degree of technological and managerial competence, there is great potential for the development of electronics in India".[15] Moreover, the employment generation capacity of this industry is found to be higher than many other industries.

However, in India the lopsided product structure and the consequent increase in imports seems to have had its adverse impact on the employment generation capacity of this industry as well. The employment generation/labour absorption capability of an industry could be gauged from the trends in wage share in value added. A priori, the wage share tends to increase either with increase in wage rate or with the increased rate of labour absorption. In India what we observe is, even with a rise in the wage rate the share of labour in the value added declined (see Table 10). In spite of an almost doubling of the average wage rate during 1981-82 to 1984-85 as compared with previous period, the average share of labour in value added declined by more than five percentage points. That is, with an increase in output growth the employment generation capacity of the industry declined. To illustrate, while the output has grown at a rate of 33 per cent during the post-1980 period, the growth of employment was only at a rate of 11 per cent.

Since the production process in electronics essentially involves the assembly of components, it is possible that the employment generation capacity may come down with technological changes. The switch over from the transistor technology to IC technology tremendously reduced the number of components to be assembled in making a final equipment. Moreover, the introduction of automation could also reduce the process of employment generation. But in the Indian context it seems that the reduction in employment generation capability is not so much due to automation or improvement in technology. What could have retarded the generation of employment in India is the increasing imports of the CKD/SKD kits because the labour requirement in assembling equipment from these kits is con-

siderably lower than what is needed in designing and assembling equipment from individual components.

FOREIGN EXCHANGE EFFECT

Since the electronic equipment are made out of assembling the components, the moot question in the context of an ever widening gap between equipment and component production is, where from the components come for assembling the equipment. Obviously, in the absence of domestic production their demand was met through imports. The data on import of electronics products into the country is practically non-existent and what does exist is almost certainly a huge underestimate. For example, Electronics Trade and Technology Development Corporation published a status report in 1983 in which it gave data on Indian imports in 1980. Some degree of underestimation is obtained by comparing ETTDC import figures with the US estimate of exports to India. According to ETTDC Indian imports amounted to US $ 30 million from US and $76 million from all countries in 1980. According to the Marketing Service Department of US Electronics Industries Association, the US exported electronics worth $ 90 million t India in 1980.[16] However, a statemer recently made by the minister in the parlia ment brings out, to some extent, the foreig exchange outflow on account of electronic import. India imported components and ra materials worth Rs 1,250 crore in 1987-8 The corresponding figures for the yea 1986-87 and 1985-86 were Rs 950 and 75 crore respectively.[17]

For our purpose we have compiled impor data from United Nations World Engineer ing Trade Statistics. It is found that th dependence on imports is increasing ove time and it is more pronounced in th post-1980 period. To illustrate, the import a a percentage of total production increase from 33 per cent in 1975-80 period to 45 pe cent during 1981-86. It is also to be note that in South Korea, the same ratio declined from 51 per cent in 1980 to 41 per cent in 1985. More importantly, during 1981-86, while the imports grew at a rate of over 36 per cent the total production increased only at a rate of 33 per cent. Therefore, the increase in demand was being met through imports. To be more specific the share of import in total demand increased from 25 per cent during 70s to more than 32 per cent in the 80s. Whereas in South Korea the share of import in total demand declined from 43 per cent to nearly 35 per cent. The increasing import dependence in the Indian context has to be seen together with the near stagnancy in the share of export in total production. Needless to say, the increasing dependence on imports seems to have thwarted our attempt towards import substitution. This is evident from the decline in the value of domestic availability ratios (see Table 11). The discussion on imports so far made, in fact, underestimate the magnitude of foreign exchange outflow because we have not taken into account the drain on foreign exchange caused by technology import. Intuitively, the number of foreign collaborations in electronics per annum increased from only seven in the seventies to over 200 in 1986. Along with this, the number of multiple collaborations also increased. To illustrate, let us take the case of push button telephones. In 1986 eight foreign collaborations were approved in this area.[18] This was justified on the ground that it will increase the domestic competition. But when five out of eight firms were collaborating with the same foreign firm for the same technology the possibility of enhanced competition is hard to realise.

CONCLUSION

The Indian electronics industry is still in its nascent stage of development, contributing less than five per cent of the country's industrial output. However, in recent years there has been an apparent improvement in the output growth of this industry. The main thrust of our discussion has been to understand the implications of this output growth on the different dimensions of

TABLE 10: TREND IN THE SHARE OF LABOUR IN VALUE ADDED AND WAGE RATE

industrial structure on the one hand and its impact on the industry's capability to generate value added, employment and reducing the yawning trade gap of the country on the other.

It is found that when the industry was sought to be developed in a 'controlled regime' with an integrated product structure and dominant role to the public sector, the growth rate of overall output was modest. On the otherhand, the growth rate was high when the strategy shifted towards a liberalised regime wherein emphasis was placed on a greater play of market forces by relaxing controls on industrial licensing system in general and controls on imports, technology acquisition, capacity creation and location in particular. The liberalisation, by reducing the barriers to entry, encouraged competition and led to price reduction and real output growth of the industry. However, when the investment decisions were left to the market forces in a situation where the private sector was assuming an increasing role much of the investment was guided towards less capital intensive and quick profit yielding consumer goods based on imported and penultimate stage raw materials. In any case, the output structure of the industry became less integrated and lopsided. The lopsided product structure had its adverse effect on the industry's capability to generate value added, employment and foreign exchange. More importantly, the imbalance in product structure wherein the professional electronics accorded lower priority would have adversely affected the industry's capability to augment the process of restructuring of the industrial sector.

This, however, does not necessarily imply that we should do away with liberalisation as a strategy option. Obviously, liberalisation had its positive output growth effects. The present study, however, highlights a few disquieting aspects of the higher output growth and points towards the need for a rethinking on the process of unleashing of market forces so that the undesirable effects of liberalisation are minimised.

Notes

[Thanks are due to K K Subrahmanian and P Mohanan Pillai for their guidance. I have benefited from discussions with Asok Parthasarathi, Jairam Ramesh, S L Sarnot and K N Harilal. The usual disclaimers follow.]

13 From ASI we have taken 364, 365, 366 and 367. 364 represents consumer electronics, 365 and 366 represent professional electronics, 367 the component sector. The total value of output as given by ASI is found to be nearly 70 per cent of the total production as given by Electronics Commission and ASI do not take into account defence production which according to the DoE comes to nearly 10 per cent. Incidentally, it may be noted that 364 includes a part of telecommunication also.

14 The declining trend in value added could be seen even before 1980s in the case of consumer electronics. This has to be viewed against the changes in the product composition where the share of television increased considerably.

15 DoE, (1979) op cit.

16 World Bank, *Comparative Study of Electronics in India and South Korea*, 1984. Here it is estimated that the Indian import in 1980 were in the range of $ 200 million to $ 40 million.

Iconoclasm Is Necessary

DN

ICONOCLASM is a necessary endeavour, intellectual and practical, in every age. There are those whose basic outlooks have to be rejected and there are others whose limitations have to be understood. Call it what you will, developing a critique or iconoclasm, such a settling of accounts is essential in each age for the oppressed to be able to carry forward their struggle for emancipation. If the sham of the 'Bengal Renaissance' had to be exposed some twenty years ago, the limitations of past class struggles as, for instance, that conducted by Swami Sahjanand's Kisan Sabha, have to be brought to light today. This is not just an idle endeavour, but one critically related to the task of working out a direction for the continuing agrarian struggle in Bihar.

Involvement with the agrarian struggle in Bihar immediately raises one question—how is it that the state with the most developed and militant kisan organisation in the colonial period is the very state that is, by all accounts, today the most feudal state? And then: was it that the aim of the Kisan Sabha was a limited one, and did not encompass a full-fledged, anti-feudal programme?

A study of the Kisan Sabha's movement and the pre- and post-zamindari abolition agrarian structure led to the conclusion ("Swami Sahjanand and the Kisan Sabha", April 1) that has caused AM so much offence ("Calcutta Diary", May 13) that "the nature of the sub-feudals and occupancy raiyats who led the Kisan Sabha helped restrict the anti-zamindari movement to an attack on feudalism from above [i e, the feudalism created by the Permanent Settlement]." Further, it was held, "Swami Sahjanand's lifework did weaken feudalism by eliminating zamindari, but that too was done in a manner that did not end the dominant position of the upper castes".

The 'mainstream left', however, cannot countenance any such critique or evaluation of the 'left formations' of the past. They are the sacred cows that are above questioning. If we do not develop a critique of the Kisan Sabha how could we possibly understand why it collapsed after Zamindari Abolition? The 'mainstream left' has long since ceased to be concerned with the struggles of the peasants. It follows that for them there is no need for a critique of the older Kisan Sabha. It is enough to observe centenaries—the Nehru-Gandhi dynasty does it with all the pomp and show that the Indian state can command; their poor cousins in the 'mainstream left' are left to manage with a seminar here and there. The approach of the two, however, is basically the same—sing praises and let the critics be damned.

What better way to damn the critics than to misrepresent their arguments,as the 'mainstream left' does? The conclusions above should be compared with the misrepresentation of the argument, "Merely because he [Swami Sahjanand] sprang from a superior caste, his Kisan Sabha should not be cast out as casteist". The upper caste origin of the Swami and others who led the Kisan Sabha was only the starting point of our analysis. There was no attempt at deducing from that fact anything about casteism.

The inference was made, from the relevant passages of the manifesto of the BPKS, that the BPKS was set against the distribution of land to the landless, the agricultural labourers largely from the dalit castes. The BPKS Manifesto held that the poverty and misery of the tenants cannot be rooted out till "drastic changes are made in the land tenure and revenue system, till the crushing burden of the debt is lifted off, and finally till Imperialism is replaced by a National State which is of the masses and, which guarantees enough land to every tiller of the soil to enable him to support himself on a reasonable and ascending standard of living and provides *gainful employment to the landless*" (quoted in Rakesh Gupta, *Bihar Peasantry and the Kisan Sabha*, PPH, 1982, p 101, emphasis added). If landless labourers were also included in "tillers of the soil" why would there be a separate programme of "gainful employment" for them? Isn't it a valid inference that the BPKS did not include the mainly dalit landless labourers among the tillers of the soil? This is a valid inference about the BPKS and not a mis-representation of an argument.

Why did the BPKS, in the above manner, separate tillers from landless labourers? Here, it is necessary to see that in traditional (i e, feudal) Indian society, there was a deep divide between the kisans (peasants) and the mazdurs (labourers). It was this approach that was manifested in the BPKS having a programme of "gainful employment to the landless" and not one of "land to the tiller, including the landless".

This brings us to the important point of the diatribe of the 'mainstream left' against radicals who acknowledge the existence of caste as a real, social category. The point is not to counterpose 'caste analysis' to 'class analysis'. The point is to work out a correct class analysis of Indian society.

It was Kosambi who pointed out: "Caste is class on a primitive level of production" (*The Culture and Civilisation of Ancient India in Historical Outline*, p 50). The primitive level of production referred to is obviously not of pre-class society but within class society itself. Whatever the dispute about whether what existed in pre-colonial India was feudalism or not, caste was the form of economic organisation of that society. Caste defined the social division of labour and established relations of bondage.

Caste was class in feudal India. Both the development of a feudalism from below and the weakening of feudalism in the immediate pre-colonial period began to modify this picture. Some sudra castes (e g, Marathas in Maharashtra, some Kurmis in parts of Bihar) pushed themselves up into revenue-collecting positions. But the major transformation of the feudal classes began with colonial rule.

Both in the colonial and in the post-colonial periods there has been a dual policy of eroding and retaining feudalism. It is not that classes developed within castes; but that bourgeois classes grew within feudal classes. Some sections of the parasitic classes were pushed down the ladder and underwent a process of partial peasantisation. Simultaneously some sections of the intermediate peasant castes, accumulated and went up the ranks to become rich peasants, while some others were pushed down to become agricultural labourers. Here too, there was difference in the feudal origin of the new agricultural labourers. Drawing on the experience of Bihar, the new agricultural labourers came mainly from the former service castes, whose work was reduced with the decline of the feudals and the growth of bourgeois services. The dalit castes of agricultural labourers and menials remained, for a long time, more or less in the same position. Movements of the dalits and the subsequent policy of reservations in some jobs helped bring about some changes in their position, and a few made the transition from agricultural labourers to poor peasants.

The point from the above account is that the classes (castes) of feudal society have been modified by bourgeois development. But this bourgeois development is both very incomplete and warped. That is the price of imperialist-sponsored growth without a basic, anti-feudal revolution. Consequently, when it is said that in the more backward areas of, say, Bihar there is a close correspondence between class and caste, what this really means is that the old feudal classes more or less remain intact, very little modified by bourgeois development. But, even where this bourgeois development is much stronger, there are still specific caste oppressions and caste privileges. The structure of that most modern class, the working class, is also influenced by the old classes from which it has originated. The declassed elements of the old, feudal classes (including the feudal hangers-on) contribute to the upper, relatively well-paid section of working class, out of proportion to their presence in the working class as a whole. At the same time, the contract labourers and others at the bottom of the scale almost entirely come from the dalits, the tribals, and the lower sections of the backward castes. The classes at the bottom of the feudal ladder are also the ones that provide the overwhelming numbers of those in the lowest section of the working class.

As a result of the incomplete and warped manner in which feudalism has been partly transformed, the struggle to establish a democratic foundation for India continues with the task of smashing completely the old feudal class (caste) base of social and economic organisation.

The 'mainstream left' certainly disagrees with the above analysis. Which is why the 'Left Front' government of West Bengal accepted the recommendations of a commission that reservation should not be on a caste (i e, feudal class) basis and that it should instead be on the basis of "poverty and low levels of standards of living" (Mandal Commission Report, Vol 1, p 11). To be true to its beliefs, why doesn't the 'mainstream left' agitate for the cancellation of reservations to dalits and tribals and instead

NOTICE

(FORM – IVA)

(See Rule 4A (1))

It is hereby notified for the information of the public that **Apollo Tyres Ltd.** proposes to make an application to Central Government in the Department of Company Affairs, New Delhi, under sub-section (4) of section 23 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the take-over of the whole or part of SPIE CAPAG INDIA LTD.

Brief particulars of the proposal are as under:-

i) Name and address of the applicant : Apollo Tyres Ltd.
60, Skylark
Nehru Place,
New Delhi - 110 019.

ii) Name and address of the undertaking the whole or part of which is proposed to be taken over and the manner of take-over i.e. by acquisition of shares, acquisition of control or management, whether by the acquisition of the ownership of the undertaking or under any mortgage, lease or licence or under any agreement or other arrangement. : Spie Capag India Ltd.
Allahabad Bank Building,
17-Parliament Street,
New Delhi - 110 001.
Subscription to 80,000 equity shares of Rs. 10/- each i.e. Rs. 8 lakhs, out of a total issue of Rs. 20 lakhs

iii) Management structure of the applicant : A public Limited Company managed by two Managing Directors i.e. Shri Raunaq Singh (Chairman & Managing Director) & Shri O. S. Kanwar (Vice-Chairman & Managing Director) under superintendence and control of the Board of Directors of the company.

iv) Capital structure of

a) the applicant :

Share Capital	Authorised (Rs. Lakhs)	Issued & Subscribed (Rs. Lakhs)
Equity shares of Rs. 10/- each	5000	840.20
11% redeemable Preference shares of Rs. 100/- each	200	74.98

b) the undertaking proposed to be taken over :

	(Rs. Lakhs)	(Rs.)
Equity shares of Rs. 10/- each	200	700

Initial paid up equity share capital shall be Rs. 20 lakhs. Apollo Tyres Ltd. proposes to acquire 40% out of the initial issue i.e. 80,000 equity shares of Rs. 10/- each amounting to Rs. 8 lakhs.

v) Line(s) of business of the undertaking which will or is likely to emerge as a result of the proposed take-over. : The new undertaking will carry on the business of wrapping and coating of pipelines, horizontal drilling, laying and construction of pipelines, providing services for inspection and maintenance of pipelines and other related work in the field of Oil and Natural Gas.

vi) Consideration for the take-over : Rs. 8 Lakhs for 80,000 equity shares of Rs. 10/- each.

vii) Scheme of finance indicating the source(s) of finance for the proposed take-over : To be generated out of internal resources of the company.

Any person interested in the matter may make a representation to Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, Dr. Rajendra Prasad Road, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

For APOLLO TYRES LTD

(V.P. GOYAL)
VICE PRESIDENT (LEGAL) &
COMPANY SECRETARY

Date This 18th day of August 1989.

ask for the uniform acceptance of "poverty and low levels of standards of living" as the criteria for reservation? It will certainly help the *bhadralok* to establish an even stronger hegemony over the minor positions. As it is, West Bengal has about the worst record in the entry of dalits and tribals into the modern (bourgeois) spheres, into politics too. The picture of the domination of declassed feudal elements is only partially broken by the Naxalite peasant uprisings of the late sixties and early seventies. The emphasis in these uprisings on the landless and poor peasants, with some sensitivity to tribal patterns, led to at least a few political leaders emerging from such sections. This, however, was partial and did not extend to the dalits of Hindu society. But the change having been partial, that should not lead us to ignore what was done; just as the partial nature of the Kisan Sabha's anti-feudalism should not lead to it being dismissed. (Incidentally, A M has got his facts wrong when he labels Rana of Midnapore "a Rajput settled in Bengal". Santosh Rana comes from the Tili caste, a minor backward caste in Jharkhand.)

The actions of the 'mainstream left' are proof that their methods of class analysis are completely wrong. Any exploitation or oppression that they do not wish to recognise, is deemed not to exist. Instead of developing their theories to comprehend all aspects of oppression, they must instead pretend that only that exists which is sanctioned by their theories. Their methods of analysis are of no use to the oppressed and exploited, as these methods can provide them with no guide on what they should do. Their methods of analysis are, however, just right for the Indian state and ruling classes—which need to peddle such analyses as "Marxist notions of ideology and class consciousness" and "established ideas on class and class formation".

The first thing in Marxism is to decide on which side one is; on the side of the oppressors, or on the side of the oppressed. The 'mainstream left' of today have established themselves firmly on the wrong side of this divide. That was not the position of Swami Sahjanand and the Kisan Sabha of his time. They stood against the main exploiters of that time, but were unable to articulate a full-fledged anti-feudal programme. That movement requires a critique, in order to understood its limitations, so as to work out the present direction of the peasant movement. The actions of the 'mainstream left' today and the ideology that justifies them, on the other hand, deserve nothing but denunciation.

If Bengal in the past had a phoney renaissance, today it has a phoney left. Iconoclasm with regard to such a 'left', its actions and its methods of analysis is a very necessary preparation for an advance in the movement of the oppressed. Such iconoclasm, however, is very far removed from pessimism. Rather, it springs from the optimism generated by the oppressed on the move; on the move, despite the attempts of the 'mainstream left' to decry their movements and to set themselves up as the sole arbiters of "Marxist notions of ideology and class consciousness". By equating 'iconoclasm' with 'pessimism' is an attempt being made to establish 'diplomatic immunity' for the 'mainstream left'? The struggles of the oppressed, however, admit no forms of immunity.

Auditors' Report on the Bombay Branch of Banque Indosuez under Section 30 of the Banking Regulation Act, 1949.

We have audited the attached Balance Sheet of the Bombay Branch of Banque Indosuez as at 31st March, 1989, signed by us under reference to this report, and the relative Profit and Loss Account of the Bombay Branch of the Bank for the fifteen months ended on that date with the books of account maintained and produced to us at Bombay.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with the provisions of Sub-Sections (1), (2) and (5) of Section 211 and Sub-Section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account, together with the notes thereon, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that subject to and read with the foregoing remarks.

(1) we have obtained all the information and explanations which to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory;

(2) the transactions which have come to our notice have been in our opinion, within the pow of the Bombay Branch of Banque Indosuez;

(3) in our opinion, proper books of account as required by law have been kept by the Bra so far as it appears from our examination of those books;

(4) the abovementioned Balance Sheet and Profit and Loss Account of the Bombay Branch the Bank dealt with by this report are in agreement with the books of account;

(5) in our opinion, and to the best of our information and according to the explanations giv to us, the accounts together with the notes thereon, give the information required by t Companies Act, 1956 in the manner so required for Banking Companies, and on such ba the said Balance Sheet gives a true and fair view of the state of affairs of the Bombay Bran of the Bank as at 31 March, 1989 and the Profit and Loss Account gives a true and fair vi of the profit of the Bombay Branch for the fifteen month period ended on that date.

NOTICE

It is hereby notified for the information of the public that HINDUSTHAN DEVELOPMENT CORPORATION LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval for manufacture of new articles. Brief particulars of the proposal are as under

1. Name and Address of the Applicant : Hindusthan Development Corpn. Ltd
   Mody Building
   27 Sir R N Mukherjee Road
   Calcutta - 700 001.

2. Capital structure of the Applicant Organisation :

   (As on 31.03.1989)

	Equity Shares (Rs. lacs)	Preference Shares (Rs. lacs)
Authorised	1200	300
Subscribed & Paidup	842	50

3. Management structure of the Applicant Organisation indicating the names of the Directors, including Managing Director/Whole-Time Director and Manager, if any : The Company is managed by the Executive Director under the superintendence and guidance of the Board of Directors consisting of.
   1. Shri R P Mody — Chairman
   2. Shri P K Khaitan
   3. Shri A K Gutgutia
   4. Shri G K Bhagat
   5. Shri M Sen
   6. Shri A Ishikawa
   7. Shri S K Neotia
   8. Shri V A Mody
   9. Shri H Jhunjhunwala — Executive Director

4. Indicate whether the proposal relates to the establishment of a new undertaking or a unit/article : The proposal relates to manufacture of new articles in the existing Unit.

5. Location of the new unit : Not applicable as the proposal is for manufacture of new articles in the existing Unit at Haldia, Distt. Midnapore (West Bengal).

6. Capital structure of proposed undertaking : Not applicable.

7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/article indicate :

   i) Name of goods/articles
   ii) Proposed licensed capacity

1. Caustic Soda	49,500 TPA
2. Liquid Chlorine	22,500 "
3. Hydrochloric Acid	15,000 "
4. Stable Bleaching Powder	15,000 "
5. Hydrogen Gas	9.2 million NM^3 per annum

   iii) Estimated annual turnover : Rs 4155 Lacs

8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Not Applicable

9. Cost of the Project : Rs 4875 Lacs

10. Scheme of finance indicating the amounts to be raised from each source :

	(Rs. lacs)
Rupee term loan and/or issue of debentures/or shares	3150
Foreign exchange loans	750
Internal accruels	975

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, 110 001, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Vol XXIV No 34 August 26, 1989

Technical Change in Textile Industry

Why has the pace of technical change in Indian industry been so slow? What determines the pace of change? Since Indian R and D efforts have been meagre, why has industry not imported more modern techniques? What is the role of the Indian capital goods sector in this process? A discussion of these issues in the context of the Indian textile industry. M-103

Class Politics and 'Legitimacy'

The concept of legitimacy seems to have become the master-key explaining the political process, the stability of social orders, the effectiveness of the ruling class and the contradictions of capitalist or collectivist societies. Marx is thus turned on his head: Collective material interests are subordinated to and derived from the pursuit of legitimacy. But is legitimacy actually the relevant issue at all or is it at best a derivative or subsidiary concern? 1955

Wages and Productivity

What have been the trends in real wages and productivity in the Indian industrial sector? A study of eight major industries covering the period 1967-84. M-94

Size and Innovation

In the traditional literature on the developed countries the consensus was that large firm size and increasing concentration increased innovative activity only up to a point. However, recent literature has questioned this received wisdom. A fresh appraisal of the empirical literature on the relationship between firm size and market structure on the one hand and inventive activity on the other. M-113

A survey of a variety of market segments in India shows that markets dominated by subsidiaries and associates of multinational companies have given significant shares to small enterprises that have adopted ingenious methods to enter the market and grow. What have been the reasons for the success of the small enterprises? M-127

Self-Reliance in Telecommunications

The setting up of the Telecommunications Commission has been claimed to mean that the revamping of the entire telecommunications system has been firmly put on the government's agenda. However, there are some good reasons for being sceptical about this claim. 1941

Gender and Production Relations

The division of labour between men and women seems to be the most 'natural' aspect of human society, seemingly based on procreation. Actually this division is inevitably connected with particular relations of production. 1949

Lost Credibility

The latter half of the 1980s has been a rather unheroic period in monetary policy in India. Explicit monetary targeting has unfortunately coincided with fiscal profligacy, thus eroding the credibility of monetary planning. 1959

Panchayati Raj

Congress(I)-ruled states have been notorious for not holding panchayat elections. This problem could surely have been resolved within the Congress Party without any need to amend the Constitution. 1936

Industry and Agriculture

The nature of the relationship between industry and agriculture depends crucially on the relative growth of income and employment in the industrial and tertiary sectors. 1963

Waveless Election

The Lok Sabha elections of 1989 will most probably reflect, as objectively as an election can, the socio-economic changes in India during the last decade and more. 1937

Property and Perestroika

To most reform-minded economists in the Soviet Union, socialist ownership has become an impediment to substantive economic reform. 1947

Data Base

The Development Information System as it has evolved over the last 40 years and as it is at present managed has major limitations given the emerging information requirements. M-131

The development of an information system for urban planning is dependent on the development of a planning system. The fact that urban data bases are virtually non-existent reflects the amorphous character of our urban planning. M-141

Universal Salt Iodisation Policy

I WRITE with reference to the article by K P Aravindan 'Science in Service of Monopolies: Universal Salt Iodisation Policy', (July 8). There are several references to my work in the article, mainly questioning its scientific validity. I am aware that your weekly is truly not the forum to debate issues in Thyroidology. However, as Aravindan chose to make use of *EPW* to question my work, I am left with no choice but to briefly clarify, through your columns, some of the issues raised.

I am not persuaded that Aravindan's criticism of the policy of universal iodation of edible salt in India is based on sound socio-economic considerations. The gist of Aravindan's arguments and my responses follow.

(A) *Though goitrous subjects have elevated TSH levels, because they also have elevated T3 levels, they have normal thyroid function.*

This argument, based on old concepts, is untenable in the light of current understanding. The current concepts in this regard are

(i) The most sensitive indices for primary thyroid failure are basal TSH levels and TSH response to TRH.

(ii) Circulating T3 level is a poor discriminant between hypothyroid and euthyroid subjects.

(iii) The major proportion of circulating T3 is derived from monodeiodination of T4 in peripheral tissues.

(B) *According to Aravindan, the entity of sub-clinical cretinism does not exist and the work done by us in India in this regard is not 'real science'.*

The truth is that sub-cretinous syndromes are recognised and reported from major goitre endemias by workers all over the world. Our contribution in the area has been to relate this phenomenon with the high incidence of neonatal chemical hypothyroidism. Our relevant work dismissed as 'slipshod' by Aravindan, was internationally peer-reviewed and published in a leading scientific journal brought out by the World Health Organisation.

(C) *The neonatal chemical hypothyroidism demonstrated by us in the sub-Himalayan endemic belt may be akin to the transient hypothyroidism described from iodine deficient regions of Europe and hence may be harmless.*

That these two entities are very different should be evident to the most casual surveyor of relevant literature. Quantitatively, the degree of hormonal abnormality demonstrated in the European neonates is of the order of 5 to 12 μg/dL T4 and 10 to 20 μU/mL of TSH. The criteria we have adopted to diagnose neonatal hypothyroidism in India are T4 < 3 μg/dl and TSH $> 50\mu$U/mL. Besides, the iodine deficiency reported from Europe is a mild variety with plenty of scope for post-natal iodine availability to the neonates. Clearly this is not the case in endemic regions of developing countries. Therefore the comments of Aravindan in this respect are largely irrelevant.

Aravindan often tries to impart an air of authority to his arguments by 'selective' literature citation. Selective literature citation is a discredited practice.

I presume Aravindan belongs to the medical profession. He has prescribed iodised oil injection for expectant mothers as a preferred alternative to salt iodation. He has not cited literature in support of this prescription. Is this a wilful omission? Is he familiar with the literature in this regard?

DR N KOCHUPILLAI

Department of Endocrinology and Metabolism, AIIMS, New Delhi.

No Cover-Up

YOU have commented on the unfortunate incidents which occurred during the International Youth Festival at Pyongyang ('Exporting Congress Culture', July 22, p 1616). I fully sympathise with the feelings expressed in the piece except the last paragraph where the joint statement issued by me as president of the DYFI and D Raja, secretary, AIYF, has been misinterpreted as an effort to whitewash the misdeeds of the Youth Congress. I am giving below the full text of the joint statement and I hope this will make our position clear and set the record straight:

> Immediately after the XIII World Festival of Youth and Students held in Pyongyang, the capital of DPR Korea, a joint statement was issued by the leadership of the National Preparatory Committee of India. The purpose of the statement was to inform the youth, students and people about the success of the festival under the noble slogan of 'Anti-Imperialist Solidarity, Peace and Friendship' and also about the positive contribution of the Indian delegation in the festival.
>
> Now it has been brought to our notice that the joint statement has been misinterpreted and used to cover up certain unpleasant incidents which occurred in Pyongyang and en route. It is for the leadership of those whose members had engaged in such ignoble activities to explain what steps have been taken to prevent this in the future to save us from national embarrassment. This is all the more important as the same section had brought ill fame for our country during the Moscow festival also, not to speak of the Nagpur conference.
>
> It may be recalled that in our earlier joint statement itself reference was made about some unfortunate incidents during the festival, though we mentioned about some exaggeration also. However, while presenting the statement to the press, this admission has been totally underemphasised.

M A BABY

President
DYFI, New Delhi

European Community and NATO

THE article by Sanjaya Baru 'Economics and Politics of 1992' (May 20) states that "the EC is not simply an economic arrangement given the fact that its members are also members of NATO".

I would like to point out that Ireland, a member of the European Economic Community since 1973, is not a member of NATO. Ireland is not a member of any military alliance. Indeed, in discussing the neutral status of Austria and Switzerland the article gives the impression that membership of the European Community is incompatible with neutrality and that membership of the Community and NATO are coterminous.

This is clearly not the case as Ireland's neutrality testifies. Moreover, three European countries, Iceland, Norway and Turkey are members of NATO but are not members of the European Community.

ECONOMIC AND POLITICAL WEEKLY

Evading the Real Issues

IT is unfortunate, but equally inevitable perhaps, that the debate on the Eighth Plan, up to the present stage of its formulation at any rate, has come to centre almost exclusively on the overall growth target that should be set for the plan. Here the government has been caught in a bind of sorts. After claiming, on the basis of the growth rates of just a couple of years, that the economy had moved to 'a higher growth path', to accept a growth target for the Eighth Plan which was not impressively higher than the 5–5.5 per cent annual growth aimed at in the earlier plans would have been to acknowledge that the recent economic performance does not amount to any notable mutation of the economy's modest long-term trend growth rate of 3.5 to 4 per cent per annum. This, for dear life, the members of the Planning Commission had to avoid doing at all cost. The debate on the Eighth Plan's growth target has also underscored the tenuous and peripheral character of the planning process in the country. The Planning Commission is evidently mesmerised by the expected improvement in the incremental capital-output ratio (ICOR) in the Seventh Plan from about 4.6 to 4.3. From this it has been a simple step for the commission to suggest that there is no reason why the ICOR could not be made to go down further to 4.15, or even lower, in the Eighth Plan, thereby opening altogether new vistas of growth. Why bother about such inconvenient considerations as that the improvement anticipated in the ICOR in the last two years of the Seventh Plan may almost entirely be due to the rise in agricultural output growth thanks to successive excellent monsoons; that the possible reduction in ICOR in the last two years of the Seventh Plan is almost certainly not part of any trend; that the modest GDP growth of 4 per cent per annum in the first three years of this plan itself points to the ICOR having been much higher as recently as that.

The growth target is not, of course, the central aspect of the Eighth Plan. The debate needs to focus instead on the many substantive issues and problems which are crying out for attention and action in the Eighth Plan period. Among these, in the agricultural sector, one can illustratively list the niggardly growth rate of output, notwithstanding the 1988-89 bumper crop; the sluggishness in investment both by the government and by farmers across the country; the rapid growth in the number of marginal farmers; the clear signs of labour absorption in agriculture having reached its limits; and the persistent inter-regional and inter-crop disparities in growth rates. Not many of these issues have been adequately taken into account in the so-called agro-climatic approach to agricultural development envisaged in the Eighth Plan. Agricultural growth in Punjab, Haryana and western UP has slowed down without an offsetting pick-up elsewhere. The spread of irrigation has suffered because of insufficient public sector investment. Dependence on rainfed agriculture therefore continues to be preponderant. Also, the agricultural sector too has begun to face demand constraints as a result of declining per capita real incomes of a large proportion of the rural population as is suggested by the fact that while the share of agriculture in total GDP has declined from 50 per cent in the early 1970s to less than 30 per cent, the proportion of the workforce dependent on agriculture has hardly come down. It is this lack of purchasing power with the people that is at the root of the necessity for government to subsidise agricultural inputs as well as output prices which in turn is a major factor eroding government savings.

In industry the bulk of the increase in output in recent years has taken place in a few areas, with consumer durables playing a major role among these. And heroic assumptions in regard to continued decline in the capital-output ratio notwithstanding, sustaining even a 6 per cent growth would require a substantial rise in the rate of domestic saving. While reports suggest that the Planning Commission appears to be counting on the average rate of saving being successfully pushed up from the expected level of about 21.1 per cent in the Seventh Plan to 23.3 per cent in the Eighth Plan, the constraints faced by the economy in raising the domestic saving rate do not appear to have overly bothered the commission. The fact is that the domestic saving rate has virtually stagnated for more than a decade now. The other side of the coin, of course, is that consumption growth—in the government and the corporate sectors and amongst households—has been unconscionably high, though precisely this phenomenon has made possible the recent rapid growth of particular sectors of industry as also of certain types of services. The contradictions of this pattern of growth, which the Planning Commission and the government are fervently hoping would continue into the Eighth Plan, are obvious.

There is no dearth of other structural issues which should be the central concern of the next plan: absence of growth of employment in organised industry and technology policies that are at the same time rendering Indian industry crippingly dependent on imports; in regard to the incidence of poverty, apart from the deterioration brought out by NSS data, the niggardly growth of employment, the stagnation of per capita availability of foodgrains and other basic consumption goods, the faster rise in consumer prices compared to the general level of prices are all symptoms which demand urgent attention. No wonder the government and the Planning Commission would rather fix their gazes on the ICOR and on growth targets.

WEST BENGAL

Communal Virus

WITHIN a space of three days two rounds of communal clashes comprising three separate incidents fouled the political climate of West Bengal. On August 13 there was a violent confrontation between a Muharram procession on the one hand and the supporters of a local sports club on the other in a village in the district of Nadia. This was said to have been a sequel to a long-standing rivalry over a football ground. Two persons were hacked to death and nine other injured in the course of this clash. The next round of two separate incidents took place on August 15, independence day: one in the east-central Calcutta region and the other in the southwestern suburb of Matiabruz. In one of his speeches on independence day, chief minister Jyoti Basu deplored these two incidents.

Unlike in some other states and in keeping with the Left credentials of the West Bengal Left Front administration, the prompt despatch of punitive forces succeeded in nipping the danger in the bud, so to say. But the fact that such incidents did occur—and two of them in the city of Calcutta—is something to worry about.

It may be no more than a coincidence that just the day before the Nadia clashes, the CPI organ carried a warning about the expanding activities of aggressive communalist forces from both the Hindu and Muslim communities—specifically the BJP, Vishwa Hindu Parishad, RSS, Jamaat-e-Islami and the Muslim League. One did not really have to be blessed with a prophetic insight to foresee the danger of a communal conflagration. Over the years of Left Front rule, occasional communal clashes have indeed vitiated the political climate of the state, some of them on a considerable scale. The small issues like a street accident, or rivalry over a playground, or teasing of a girl that tend to provoke communal confrontation bear testimony to the underlying tensions and strains in mutual relations at the grassroots level, even if the role of the organised provocateurs is not to be ignored. It would, therefore, be extremely naive and complacent a view to think that the masses of this Left-ruled state have really been immunised from the communal virus now plaguing the country as a whole.

Apart from the organisations mentioned above, there are at least two other powerful agencies on the Hindu side that demand notice. One is the notorious Anand Marg with its undisguised fascistic inclinations and suspicious international linkages which has set up a well-guarded and extensive headquarters on the eastern fringe of the city, and the other is the less obtrusive but perhaps no less worrisome Santan Dal, which had openly challenged the Left Front government and the CPI(M) over an incident of a police firing in the port trust area about a year ago. The second organisation's striking power may indeed be much greater as it combines religious mysticism and obscurantism with a radical demagogy. All this has a dangerous potentiality particularly because there is hardly any consistent work at the social base to develop the critical consciousness of the masses through united praxis. Almost the entire energy of the Left forces, more particularly its leading entity the CPI(M), is directed towards such issues as the Bakreshwar thermal power plant or the Haldia petrochemical project—that is, issues not immediately or palpably relevant to the existential problems of the masses.

The recent rounds of communal clashes may serve as a blessing in disguise only if the Left Front would care to interpret the meaning of the 'writing on the wall'.

STEEL

Policy Absurdities

THE various sections of Indian business basically support or oppose government controls on pricing and distribution depending on what suits their economic interests at a given time. In the present situation aggregate demand for steel is in excess of past levels of output, making it possible for high premiums to be obtained on a variety of steel products. But the integrated steel producers, i e, SAIL and TISCO, are subject to various forms of control over pricing and distribution. As Russi Mody, chairman of TISCO puts it, "the office of the development commissioner for iron and steel continues to exert pressure in various ways to deny free market conditions to major producers". Mody refers to the present position in regard to iron and steel control as an 'absurdity'. He also highlights the ambiguity of the official position by quoting at length from the annual report of the department of steel for 1988-89. With regard to distribution of steel the department of steel's annual report states that "there is no statutory control on the distribution of iron and steel". Yet it goes on to say that since there are shortages in certain categories of steel, in the interest of "equitable distribution and fulfilment of supplies to important sectors" the Joint Plant Committee (JPC) guidelines have to be followed by the main producers, i e, SAIL and TISCO. Again, in regard to pricing of steel the report states that there is no statutory control on the prices of iron and steel. However, prices of major items of iron and steel are determined by the JPC and are applicable to the main producers.

Apart from attempting to debunk the necessity of and highlighting the irrationality of pricing and distribution controls, Mody also refers to discrimination in their application—i e, the mini-steel plants, re-rollers and secondary sectors have no price and distribution control. And these account for roughly one-third of total steel production. The point is that at a time of shortages the mini-steel plants, re-rollers and secondary producers are deriving high premiums while the main producers are deprived of availing of this opportunity by JPC controls.

The chairman of SAIL, V Krishnamurthy, also wants the lifting of pricing controls over the main producers. While TISCO can and has been changing its product-mix in tune with changing demand conditions and profitability prospects so as to maximise its output of high value-added items (which are not under JPC control), SAIL has been politically pressurised to produce more semis to feed the re-rollers even though it has unutilised capacity in its bar, rod and structural rolling mills. Also, it is a fact that the production of semis by the integrated steel plants involves wasteful use of energy from a national point of view.

However, more intriguing is Krishnamurthy's endorsement of the World Bank's proposal to allow free imports of steel in the interest of promoting competitive efficiency. Larger imports of steel are perhaps inevitable in view of the emerging shortages of steel products. They would be needed all the more if the government were to heed the pleas, advanced by the chairmen of SAIL and TISCO alike, for the lifting of the controls on steel pricing and distribution which still apply to the main producers. However, the idea of using steel imports as part of a longer-term strategy to make domestic steel producers more efficient, as the SAIL chairman seems to be suggesting, is a far more complex proposition. Surely the chairman of SAIL is aware of cartelisation and other trade distorting practices such as subsidies in the international steel market. Also, the pricing of steel in the international market is not the same as in the domestic markets in Western Europe or Japan. Thus steel prices in international trade can go as low as the short-run marginal cost of produc-

tion constituting virtual dumping. Large or 'free' steel imports, to use the SAIL chairman's term, may in these circumstances, have the consequence not of promoting competitive efficiency among domestic producers but quite the opposite—of displacing domestic output and lowering capacity utilisation in the domestic steel industry.

AIR SERVICES
Warped Priorities

VAYUDOOT's managing director recently declared that by 1995 all the 450 district headquarter towns in the country were proposed to be connected by Vayudoot air services. At present, this feeder service connects about 100 stations.

The establishment of airports in all the district headquarter towns by 1995 and rapid expansion of air services are part of the modernisation drive. At the same time, by extending air travel to accessible areas Vayudoot is now being utilised to promote parallel and superfluous air services where alternative modes of transport already exist or are conceivable. This is contrary to the purpose for which Vayudoot was originally set up in order to offer flights in sectors having long and circuitous routes to reach destinations and in outlying areas, as in the north-eastern states, Himachal Pradesh and Kutch in Gujarat. Further, tourism promotion is stated to be a reason for expanding Vayudoot services, but it has been found that foreign exchange constitutes only about 5 per cent of the earnings of the airline.

Flights, being very expensive, will only benefit the top 5 per cent of the people in India, including political leaders, government officials, (private and public sector) company executives and other affluent professionals. For instance, Vayudoot flights between Madras and Neyveli town in Tamil Nadu are reported to primarily benefit top executives of Neyveli Lignite Corporation. Airports have also been opened in many district towns on political considerations. Recently in Haryana, two Vayudoot airports were opened after the state government guaranteed that it would allow government officials to utilise those flights. Vayudoot has a Rs 600 crore fleet expansion project under consideration by the government.

Vayudoot has decided to add a few 19-seater Dornier aircraft to its fleet and Hindustan Aeronautics is assembling these aircraft by importing components from West Germany. Curiously, HAL is converting many of these small planes into luxurious 7-seater executive aircraft for use by industrialists. Our industrial magnates can now fly their own private planes utilising the extensive infrastructure being set up at enormous cost by Vayudoot and Indian Airlines.

Yet another feeder service, the air-taxi, has been approved by the government. The air-taxi service to be promoted by private companies and individuals will charge higher fares than Vayudoot and Indian Airlines. Who are the beneficiaries of the air-taxi service? The air-taxi service is to be allowed to use 55 airports on high-density routes.

In India, what are our priorities for the next five years? Do we need more airports or better public transport facilities for the common man? Do railway stations and bus stands in the district towns have basic amenities? Why is there a shortage of passenger buses and trains? Why are district and rural roads poorly maintained? Do we have the requisite number of autorickshaws in the district towns? Do the hospitals situated in district towns have the requisite equipment and facilities? Will we have one primary health centre for 30,000 people by 1995? Will the district and rural towns have the requisite sanitation and drinking water facilities by 1995? Do schools in district and rural towns have proper buildings, the requisite class-room and laboratory facilities, playgrounds, sanitation facilities? Will all the district headquarter towns have science museums by 1995?

The Planning Commission has in a recent study strongly advocated a check on the expansion of the domestic civil aviation facilities during the Eighth Plan period because of heavy foreign exchange outgo for imports of aircraft and costly aviation fuel. The commission has maintained that scarce resources should be utilised on a priority basis, to rectify the mismatch between technological sophistication of new generation aircraft inducted recently and the existing air operations. The Planning Commission has further found that short-distance flights, being uneconomic, involve subsidies many times the fares charged by Vayudoot, as extensive infrastructure is being created and maintained at huge cost to operate flights which are extremely few.

When the country faces an acute foreign exchange crisis and when resources are scarce to provide even basic and essential needs of the vast majority of the people, should the air services be rapidly expanded? It is to be hoped that the government will give serious consideration to the views of the Planning Commission.

TWENTY YEARS AGO

EPW, August 23, 1969

It is too early to say whether tea plantation workers in West Bengal will come out of their strike as successfully as jute workers did a fortnight ago. But these two strikes could mark the beginning of a new strategy of trade union activity... Conditions in both industries have been long ripe for a show-down between employers and workers... The modest increases in wages granted by the Central Wage Boards in these two industries several years ago are no longer enough to hold back renewed pressure from workers for further increases. But in neither industry have employers ever shown much inclination for collective bargaining and their response to the present wage demands from workers was predictably negative... The most important aspect of the jute strike as well as the tea plantations strike, of course, is that in both trade unions have for once got over internecine rivalries and acted with complete unity... Situations like those in jute and tea plantations are likely to develop in other major industries as well. The jute industry and tea plantations could well provide the pattern for them to unitedly force a direct confrontation with employers.

* * *

The most significant aspect of the presidential election was the manner in which other political parties and forces intervened decisively in the conflict between the governmental and organisational wings of the Congress Party... The election brought out, for the first time so clearly, the important role that, given a particular political situation, purely state parties like DMK and Akali Dal could play in determining the course of national events. These parties themselves had not perhaps to begin with visualised any such role for themselves... Much the same can also be said of the importance of non-Congress state governments... What all this adds up to is not so much polarisation—despite the superficial Left-Right line-up in the presidential poll—as pluralisation. This development is of relevance not only to the current battle for supremacy in the Congress, but more generally also to the relationship between the prime minister and the party. In this kind of situation in any party which participates in a government, whether at the centre or in the states, the governmental wing must emerge more powerful than the organisational wing.

POLAND

Not By Christian Faith

THE Brezhnev doctrine, formulated in 1968, which limited the sovereignty of the east bloc countries, has been abandoned by Gorbachev, and this perhaps promises well for international socialism. However, Poland's current genuflexion to the market economy augurs ill for today's troubled socialists. If there is such a thing as assigning culpability for the historical process, the Polish United Workers Party, in power for nine and a half decades, cannot escape its share of blame for the current crisis. Forty years of mindless *etatisme*, shorn of creative ideological thinking, foisted on Polish society as socialism could not but have invited the kind of reaction that is being witnessed. The nomination of Tadeusz Mazowiecki, a prominent Solidarity intellectual, following the movement's sweeping victory in the June elections for 35 per cent of the Sejm seats and 100 senatorial seats and the constitutional crisis that attended the inability of the PUWP to obtain the support of its erstwhile appendages, the Democratic Party and the Peasants Party, in electing its own nominee Czeslaw Kiszczak, has prompted the mainstream in the west to pen obituaries of the socialist project.

The crisis, however, is far from over. While Mazowiecki's appointment has solved the constitutional stalemate (none of the parties independently constitute a majority in Sejm and consequently could not form ministries on their own), the balance of political forces is still rather tenuous. This realisation has dawned on the contending forces for there is a marked change from their original positions as they move from confrontation to compromise. In April the government conferred legality on Solidarity, thus enabling it to contest the limited June elections. Then came the post-election offer of admitting Solidarity into the government to share institutional power. Solidarity's initial all or nothing bluster which led it to reject the coalition offer has given way to a pragmatic stand stemming from the realisation that a sizeable parliamentary representation does not signify anything substantial within an entrenched power structure.

Poland's overwhelming crisis is reflected in the all round exercise of political caution. There is a fear that the crisis could deteriorate into chaos and instability. Jaruzelski, reluctant to contest the presidential election, fearing lack of support, eventually won by a margin of one vote thanks to support from twelve Solidarity parliamentarians. Jaruzelski's candidature was backed by the Soviet Union and the Bush administration as well as by Walesa on the perception that his continued presence would ensure some degree of stability.

The new arrangement ensures PUWP's control of the defence and interior ministries, presumably to allay Russian apprehension regarding the future of the Warsaw Pact. Walesa too has ruled out Poland's withdrawal from the pact. A serious dispute persists, nevertheless, as both Solidarity and the PUWP staked their claim for the control of economic and financial policy-making. However, the resolution of this discord is unlikely to produce immediate results until a clear victor emerges in the current ideological battle. Even if the PUWP gains the upper hand, the ongoing inner party struggle between the reformists and hardliners will continue to complicate the problem. On the other hand Solidarity's ascendancy may not obviate the impasse. Its lack of a coherent and systematic economic blueprint compounded by its loose coalitional character may generate tension in the movement which, given the absence of a defined organisational structure, might either paralyse it or splinter it.

Economic direction is the essence of the struggle and direction is precisely what the Polish economy, burdened by a 39 billion dollar external debt and beset by inflation, wants. Poland's export earnings are only a fifth of its debt obligations. The mounting budgetary deficit compelled the government to remove the 300 per cent farm subsidy. Agricultural productivity was sought to be raised by eliminating price controls, but the outcome has been lethal inflation.

Getting the economy back on the track will sorely test the Solidarity for it might involve austerity measures like wage cuts which will be unpopular with its social base. The Solidarity's antecedents might create difficulties for its trade union pedigree has not been significantly diluted by the presence of intellectuals and other disgruntled non-proletarian elements. In terms of fundamental objectives too Solidarity may be consumed by its own contradictions. Andrzej Malachowski has predicted the fragmentation of Solidarity since the capitalist path will be endorsed by rural Solidarity but will be opposed by the workers. Solidarity intellectuals too are a divided lot ranging from avowed capitalist-roaders like Malachowski to social democrats like Jacek Koran and Jan Mujzel who are partial to restructuring along Swedish lines.

For Poland there has been no dearth of advice. But even as the 'free market intelligentsia' in the west deliver capitalist homilies, there still remains the problem of 'multiplying the loaves' and for that Mazowiecki will need more than just pontifications and Christian faith.

Musings during a Debate on Panchayati Raj

Arun Ghosh

It is not easy to see why the Constitution Amendment Bill on panchayati raj was being rushed. After all, it is essentially the Congress(I)-ruled states which have been notorious for not holding panchayat elections and that problem could surely be resolved within the party, without any need to amend the Constitution. But if the real objective of the bill is pre- election propaganda, then the withdrawal of the bill at a certain point of time, laying the blame on the opposition, may make good political sense.

I

Pray do not sneer, hold back your frown,
For every circus has its clown.
You're all too serious, all too tense,
But don't take leave of commonsense,
What's a circus without a clown?

II

Though as it happens, the comic clown
Is the slickest guy about the town.
He always sees the side that's buttered,
Eschews the ones with losers cluttered,
The privileged jester of the Crown.

III

You may get him battered never down,
The sophisticated man of town.
Pray spare your contempt and your pity,
He knows his way around the city,
The courtier, writer dressed as a clown.

IV

He wears the robe, the wig, the gown,
The mantle's passed from White to Brown
Pray spare your speech, do not debate,
He can manipulate the Fourth Estate,
The pack of jokers as your clown.

V

See gathered men of great renown
In the biggest circus of the town.
In the central hall they pontificate
On the role of the people and the State.
What's a circus without a clown?

VI

In the babble of voices yours will drown,
In shouting you can't match the clown.
It matters little what you say,
The clown has a boss who'll have his way;
Every circus has its clown.

Laughter is of several kinds. There is the laughter of the child—a reflection of innocent merriment. There is the laughter of the crowd at seeing a well dressed man skid on a banana peel—not quite so innocent, yet without malice. The malicious smirk that is evoked by the sight of the fall of one's rival is not really laughter; nor is the broad smile one sees on the face of an unlikely winner in any contest of skills. So, the only other category of laughter is laughing at oneself. What a pity, this last category of laughter is getting so rare, relieved only occasionally by the likes of Laxman.

But the ingredients for invoking this last category of laughter are now pervasive. One has only to attend any seminar on the issue of "people's participation"—only one subject, mind you, out of many that are the current favourites for the circuses that go in the name of seminars—and it is difficult not to get amused. What else does one do when senior citizens start behaving either as children, innocent of the implications of what they are saying, or as illiterate goons arguing about matters which are beyond them? There is little point in losing one's temper, it leads you nowhere. The only choice is merriment.

The latest development is that the Constitutional Amendment Bill on the panchayati raj has been held over for the next session of parliament. It is not easy to see why the bill was being rushed—after all, it is essentially the Congress(I)-ruled states which have been notorious about not holding panchayat elections, and *that* problem could surely be resolved within the party, over which there is monolithic hold, without the need for a constitutional amendment—except that the provisions of the bill as proposed, in the absence of any devolution from the centre to the states to begin with, appears to be oriented essentially to establishing a direct nexus between the centre and the districts, bypassing the states. Though this has been officially denied, the prime minister has also stated publicly, and repeatedly, that the central move to pass on all funds, whether under the Jawahar Rozgar Yojana or otherwise, to the district magistrates (and to the sarpanches of mandal panchayats in some areas) is calculated to ensure that these funds are not diverted by the state governments. That this is a bizarre scenario can be easily seen from the already stringent conditions imposed by the centre in regard to the use of funds released under Centrally Sponsored Schemes. For instance, under the RLEGP, every scheme, even at the village level, was required to be approved by the central authorities.

As far as the Panchayat Bill is concerned, perhaps the only constitutional amendment—which, incidentally, was recommended by the Sarkaria Commission, now a forgotten report, even though the government had reportedly accepted it—is that there must be periodic elections to the panchayats provided for under the Constitution. It is a pity that the opposition parties could not agree that this minimum provision is the only necessary provision in the Constitution, and that all other provisions, which are matters of detail, should be dropped from the amending bill.

But then, if the real objective of the bill is mere pre-election propaganda, then the withdrawal of the bill at a certain point of time, laying the blame on the opposition, may make good political sense. However, sometimes, the obvious is not so obvious. At any rate, the extreme centralisation inherent in the bill as proposed may be a double-edged sword, for who knows what the results of the next election will be.

Nonetheless, no matter what happens in the next election, the bill in its present form is highly dangerous. We have seen over 1977-80 that nobody likes to shed power. And, in case the bill does get enacted in its present form, the possibility of its getting amended by the next parliament is almost zero.

Is this, then, an occasion for laughing at ourselves? Well, if we do not laugh at ourselves, we must realise that everyone else is doing so already, like the crowd laughing at a well dressed gentleman skidding on a banana peel. Consider the facts. We are in Sri Lanka at the 'invitation' of the Sri Lankan government, but refuse to come away long after the welcome sign has been taken down. We have had to place the Budge Budge jetties—earmarked for imports of petroleum products into Nepal—under repair, and therefore out of commission. We have very rightly and naturally protested against the supply of sophisticated radar equipment and the latest bombers and missiles by the US to Pakistan, immediately after the successful firing of 'Agni', the latest sign of our triumph over technology. And, of course, we have objected to the development of nuclear capability by Pakistan when we have always insisted on our own inherent right to develop such capability.

These issues have nothing to do with pan-

chayati raj. And yet, in a manner of speaking, they do. We seem to have lost our sense of 'accountability', lost our capacity to see the other man's point of view. We also seem to have lost the humility that comes only from strength. The somewhat free use of colourful adjectives in our legislative bodies is but one sign of these newly emerging traits in our national character.

When a legislative proposal for decentralisation (proposed with the intent to centralise power and authority to a greater extent than in the past) cannot be turned to advantage by those who desire genuine decentralisation—and who are in a position to achieve this objective—it may mean one or two things. It could mean that those who genuinely desire greater decentralisation are woolly and vague. Or, it could mean that they cannot bury minor disagreements among themselves even for a major cause, for essentially personal reasons. Perhaps both the above are true to a certain extent. Perhaps we are not very different today from the angle of societal development, from our ancestors two centuries—may be ten centuries—back.

Perhaps we need to realise this point, and initiate a process of serious introspection, since we need a somewhat basic transformation of the national character from the present 'grab as grab can' attitude which appears to permeate our economic and political life.

But then, there is little point in getting to be unduly serious when we are really not in command of the situation. After all, in the history of a nation, a few years lost are of little consequence. Perhaps we should really learn to laugh at ourselves more spontaneously and more universally. When the well dressed gentleman skids off a banana peel, he should start laughing at himself; thereby, he turns the bystanders' laughter into anxious enquiries about whether he has hurt himself. At any rate, we need a sense of humour to keep our sanity. We need a few Laxmans, a minimum of one in every language in this large country, to restore to us our sense of perspective today.

CAPITALSCOPE

A Mirror Election in the Offing

Bhabani Sen Gupta

After a long lapse of time we are going to have a normal election. In an abnormal time, when we are skating along the edges of fundamental change in the Indian political process.

THE Lok Sabha election of 1989 will most probably be a mirror election, reflecting as objectively as an election can the socio-economic changes that have accumulated in India during the last decade and more. This election will not be swayed by a positive or negative wave. Large segments of the voters will have no reason to reject Rajiv Gandhi; perhaps matching segments of voters will not wish to see him back to power. The Congress(I) turns off vaster segments of the voters than does the prime minister, while voter enthusiasm for the coalition mosaic of the opposition parties is, to put it mildly, not effervescent.

The Congress(I) is as much faction-ridden as is the opposition cleaved among its constituents. Candidates of both sides will probably be damaged in an equal measure by internal rivals and inner-party squabbles. The Congress(I)'s enormous resources—money, the official machinery, manpower, organisation, propaganda capabilities, total control of the electronic mass media—are more or less evenly matched by the resources of the opposition chief ministers who are popular, some of them charismatic, in their respective states, the high image of Vishwanath Pratap Singh, and the mobilisational capabilities of the different parties in their respective areas of political influence. Neither side appears to be better equipped than the other to win the voters' minds with purple slogans. If newspaper surveys are to be believed, corruption charges against the prime minister are not likely to turn off vast numbers of rural voters. Similarly, the propaganda flagship of the ruling party, panchayati raj and power to the people, is unlikely to set the minds of the rural voters on fire.

Abnormal Times

After a long lapse of time, we are going to have a 'normal' election.

In an abnormal time. Abnormal because we are skating along the edges of fundamental change in the Indian political process. If political actors look and behave in a Chaplinesque manner, it is because they do not seem to comprehend the fundamental political change that stares India in the face or are not ready yet to acknowledge, and submit to, it.

There is also an air of historical inevitability about the qualitative change that has occurred to our political life. It is beyond human control, and therefore inevitable.

By fundamental change is meant the permanent end of the single-dominant party system or of the hegemony of the ruling incarnation of the Indian National Congress. Also the emergence of a durable multiparty system, the country ruled by a rainbow coalition of different parties, and the thrust of an emerging new alignment of social and political forces pushing the country towards coalition politics at the centre and decentralisation and federalism in political and economic management. To be sure, the transition will take time. The decline and fall of the hegemony of the Congress Party has taken 20-plus years to mature. The process of coalition and decentralisation, however, will work faster, perhaps in a decade.

This election will put an end to the imperial prime minister. Whoever is elected to the highest executive office will not command a brute majority in parliament. He will be lucky to have a good working majority. He will face a strong, vocal, self-confident opposition challenging his rule. Yonder in the land, he will find power shared between his and other parties in a more or less equal measure. He will be obliged to seek consultations and co-operation with the opposition in parliament as well as the opposition chief ministers. Electoral confrontation will probably lead to post-election partnership in governing the country.

It is necessary to note that the single-dominant party system or what Rajni Kothari called the Congress system more than 20 years ago means the Congress Party holding power not only at the centre but also in most of the states. The imperial grandeur of the centre draws substance from power exercised in the states where national, state and rural politics mix and mingle. The hub of India's political life is not Delhi, but the state capitals. That is the main reason why the party ruling at the centre is tempted to bring as many states as possible under its rule.

A party ruling at the centre but not in several states is less than a hegemonic party. From this standpoint, Rajiv Gandhi's first term as prime minister has been loaded with a major contradiction laced with a bitter irony. A majestic majority in parliament has bred in his government, party and himself an attitude and a behaviour that is hegemonic. But the limited range of the Congress(I)'s power base in the states—at one time nearly one-half of the 26 states were ruled by opposition parties—has made hegemonic rule impossible. The opposition chief ministers have often tried to project themselves as constituting an alternative power centre. They have not been entirely without success. The opposition governments in West Bengal, Tripura, Karnataka and Andhra Pradesh, with their successful experiments in democratic panchayat raj, persuaded the prime minister to offer the rural and urban people of India constitutionally guaranteed democratic self-government at the grassroots level. This two-way traffic of ideas and experiments in political management of the country is an

inprecedented event in India's career as an ndependent nation.

COMPLEX INTEGRATION

A complex process of integration has aken place in India between the centre and he states. State politics ceased to be autonomous of the centre as far back as the ate sixties. The coalition government in Uttar Pradesh in 1969 between the party of he late Chaudhury Charan Singh and the Congress Party of Indira Gandhi brought UP and the centre together in a dynamic embrace. A stunning reality of Indian politics is that the party that is rejected by the voters of UP and Bihar cannot aspire to be ruling at the centre. To be able to govern India, a political party must be able to govern most of the Hindi belt.

Sinews of development have knit the states and the centre more closely together than ever before. Science and technology have shortened the distance between the centre and the states and between states and states. The growing demand for federalism, decentralisation and devolution of power and resource from the centre to the states and down below to the basement of the political society is to be seen together with the increasing integration of the Indian state, its steady, if necessarily slow, transformation from a soft to a hard state.

Integration and federalism are not politically contradictory processes, a fact that many Indians refuse to acknowledge. Indeed, federalism and devolution have become essential for further integration of the union as the model of nation-building from above and the command-control style of politics have spent their usefulness and do not answer the demands of micropolitical and microeconomic development which can be attempted and sustained only from below, with effective, continuous popular participation.

This is where the imperial, hegemonic leadership of the Congress Party has had its gravest faultline; it is not in tune with the changing temper of the Indian political society. This leadership has not recognised the inevitability of a multiparty regime in India. Even if non-Congress(I) chief ministers rule in some states, the ruling Congress(I) leadership expects them to submit to the overpowering majesty of the centre. A distinction is made between 'national' and 'regional leaders', when, in reality, a regional leader is also a national leader because he relates the region to the nation and is second to none in caring for national interests as he sees them. Indeed, in the opposition camp, the rising stature and influence of the chief ministers has meant a corresponding shrinking of the importance and influence of 'national' leaders without strong and stable popular support bases of their own. A multiparty political system negates the hypothesis that national psyche, national ethos and national perspectives are manufactured in Delhi alone.

Cultural contradictions of the fading single dominant party system account for the current elite ambivalence about the legitimacy of a multiparty system in the Indian scheme of politics. Four decades of political stability provided by the hegemonic Congress Party have produced an elite mind-set that tends to see in a multiparty system fearsome possibilities of fragmentation of the state, its balkanisation and disintegration. The mind-set places a high premium on a two-party system, and rejects coalitions as a substitute. Indeed, the insecurities of the elites get reflected in the fluids that go to the making of a multiparty system.

ELITE PREFERENCE FOR SINGLE-PARTY GOVERNMENT

Political parties, however, are not to elite wishes born. The seeds are sown by history in the process of accumulated social change. The Indian single dominant party system is a gift of history; the Indian National Congress, having won the freedom struggle, determined to build a nation that it would govern without challenge from other parties. That is how the single dominant party system lasted 20 years without interruption and another 20 years with interruptions and growing erosion. Its demise does not necessarily create a matching national party. The political parties that straddle the Indian scene today have grown partly in reaction to the behaviour of the Congress Party after it became authoritarian in the 70s, partly because the twice-split Congress Party could not keep under its influence large segments of the population getting politicised in a live democracy, and partly because other political parties were able to build their own mass support bases around ideologies and action programmes different from that of the Congress Party. India's diversities were absorbed by the Congress Party when it was a grand coalition of different castes, classes and interest groups. Nehru went out of his way to encourage and defer to what parliamentary opposition then existed and functioned, though he did not hesitate to overthrow the elected communist government in Kerala through means by no means democratic because he was, deep in his mind, afraid of the real threat to the Congress Party's hegemony, a threat that in the late 50s one could see likely to emanate only from the left in coalition with progressive forces growing in the suburbs of the Congress system.

A long period of single-party hegemony has not only made the emergence of a stable coalition of opposition parties difficult, it has also created a subjective gap between the elite mind-set and a coalition which is axiomatically taken to be weak and unstable. Long years of experimenting with nation-building from above have developed an architecture of integration sculpted from Delhi and erected at the initiative and under the leadership of the central government and the power elite.

In general, the power elite in India is profoundly influenced by the ethos of the hegemonic party as well as its political behaviour, even its foreign policy behaviour. This elite watches the disintegration of the hegemonic party with gasps of anguish and horror. It is shocked and even outraged by certain political and ethical lapses of the hegemonic leadership. The power elite does not hesitate to point out and lament these lapses. It even yearns for an alternative. But the alternative must also be 'national'; it

must be able to replace the Congress(I) as a strong and united party under a 'hard' leadership so that it can carry forward the labours of building a hard state.

The elite preference in India for a single-party national government at the centre defies the historical experience of the leading democracies of the world. Even at this time, several European democracies are governed by coalition governments; their stability is not in question even when they go in for mid-term election only to be saddled with returned coalitions. The Fourth Republic in France was characterised by a long history of coalition governments; even in the Fifth Republic, there are at times asymmetries between the political colour of the executive president and that of the majority party in parliament from which is drawn the prime minister. Italy is continuously governed by coalitions. So at this time are the German Federal Republic and several Scandinavian and Nordic countries. Even in Britain, the two-party system is of recent vintage, evolved only after World War II from the womb of the war-time national government. Prior to the war, Britain was ruled by coalitions of both the right and the left-and-the-centre. The European experience does not prove that coalitions prevent the evolution of a hard state from a soft one, or are incapable of dealing with internal strains and external threats and containing centrifugal forces and steadily strengthening national integration.

In India, elite aversion to coalition can be traced partly back to the vertical pillars of the castes on which our society has stood many thousand years. There has been few instances of caste coalitions, but mechanisms of mediation, arbitration and adjudication of interests and demands have been in action throughout the historical period. The vertical pillars of societal division invoke a strong and supreme leader who can keep the pillars together by charisma or force, preferably a combination of both. Now, close to the 21st century, the still surviving cultural hankering for a supreme leader (Mahatma Gandhi was appointed *dictator* of the Indian National Congress in the mid-20s in order to swiftly cement the party's crack after the birth of the Swarajya Party) is challenged by the erosion all over the world of integration models built from above, of the hegemonic systems of governance and economic development. Forces hitherto marked as progressive and integrationist are being found lacking in the substance of democracy without which there can be no stable integration at the micro level. In the coming years, the nation-building engineering of this century, which began with building a socialist superstate in the USSR and culminated in the building of well over 100 nation states in the third world, many of them multinational, will probably be drastically modified and readjusted to ascending demands for decentralisation and devolution of power and resource. The Indian model can be no exception.

Indeed, installation of a coalition of opposition parties in New Delhi will accelerate the process of decentralisation and devolution of power and resource from Delhi to the states and from the states to the rural panchayats and urban municipalities. The really powerful men in the opposition today are the chief ministers who rule in the opposition states; in Vishwanath Pratap Singh, the chief ministers have found a charismatic leader who answers some of the basic requirements of filling the office of prime minister, one of which is that he or she must come from the Hindi belt, or the western states of Gujarat and Maharashtra which are geopolitically linked with the Hindi belt. If the opposition wins the coming poll, it will be because of the rallying capacity of the chief ministers plus the charisma of V P Singh. Leaders without proven mass support base are straw men of Indian politics now. Their ability to make positive contribution to the fortunes of political parties is strictly limited.

Vital Hindi Belt

The great weakness of the Congress(I) is that it does not have a strong gaggle of chief ministers and pradesh Congress chiefs. In December 1984, Rajiv Gandhi was the party's sole campaigner. With an extravagant use of official airplanes and helicopters, he campaigned personnally in 300 constituencies. Since 1985, however, he has not been able to lead his party to a single notable victory in the state elections. If Rajiv Gandhi turns out to be once again his party's single campaigner in the coming Lok Sabha poll, the lesser mortals in the party will have serious cause for anxiety. However, there are unmistakable signs of a revival of chief ministers in the Congress(I) since the party's rout in the Tamil Nadu election in February 1989. Not only has the prime minister not been able to dismiss a single chief minister, he has deferred to several of them and given them virtual run of their states through the next election. It seems that in the nomination of candidates, men like Jagannath Mishra, Sharad Pawar and Narayan Dutt Tiwari will have a substantial voice. After the election, chief ministers will be much stronger in the Congress(I) Party than they have been in the last four or five years, indeed since the Emergency of 1975.

The outcome of the poll will be determined in the Hindi belt. The Congress system began to break down in the Hindi belt in 1967-68, when the party, to the astonishment of most observers, lost control of as many as eight states. Since then, a certain pattern seems to have set in India's electoral politics. The collapse of the Congress(I)'s stable support base in the Hindi belt has imparted tremendous dynamics of instabilities in the party's electoral and political fortunes. Only the intervention of an overpowering event external to normal politics helped the Congress(I) to restore its hegemony; over time, the restoration has tended to be less and less complete. But for the intervention of extra-powerful events, profoundly swaying the minds of the voters, the Congress hegemony would have passed several years before, and the country would have been in the grip of a multiparty system at the centre and in many of the states.

After losing political control of eight states in 1967-68, the Congress led a minority government at the centre as a result of the Lok Sabha poll of 1969 and survived with the support of the communists. In 1971, Indira Gandhi won back the centre partly with her 'socialist' actions and slogans and partly because the lengthening shadows of the Bangladesh and Pakistani crises argued strongly for a strong and stable government at the centre. It was the military victory in the Bangladesh war that enabled Indira Gandhi to restore the Congress system in India, by which, as noted, is meant governing both at the centre and the vast majority of states. But in three years, the Congress system was plunged into a deep crisis; the democratic process itself was suspended with the promulgation of the Emergency regime. In the election of 1977, the Congress was wiped out from the entire Hindi belt. Its domain was now confined to the south.

The Janata Party, created by the sweet gunshot of power, failed to build its base in the Hindi belt. When it collapsed in 1979, it also split into smithereens, and was miserably unable to put up a united fight to the Congress(I) in the poll of January 1980. It was a negative wave that swept Indira Gandhi back to power. However, the Congress system could not be restored. In 1983, the party lost its southern bastions of Karnataka and Andhra Pradesh, and was locked in two serious conflicts with two states, Punjab and Assam.

Though the Congress(I) won an impressive victory in 1980 with 42.7 per cent of the valid votes and 353 seats, its victory in the Hindi belt was shallow. It won 139 seats in five states of the Hindi belt—UP, Bihar, Rajasthan, Madhya Pradesh and Haryana—out of a total number of 214 seats. But in a mere 34 did its candidates win with an absolute majority of votes, and in UP in a miserable number of 5 constituencies. The party's share of the total valid votes in the Hindi belt was significantly lower than that in states like Andhra Pradesh, Karnataka, Maharashtra, Orissa and even Punjab. In Uttar Pradesh it was a mere 35.9 per cent, in Bihar 36.4 per cent, in Haryana as low as 32.6 per cent.

When the Congress(I) lost the south, it faced a mortal crisis because its base in the Hindi belt was far from reassuring. Indira Gandhi got intimation of the danger and swiftly announced the appointment of the Sarkaria Commission to pre-empt the issue of centre-state relations emerging as the dominant theme of the next Lok Sabha poll. Most political observers in India agreed that if the Congress(I) went to the polls with Indira Gandhi as leader, it could at best get back to power with a razor-thin majority, at the worst, lose the election heavily to a

re-emerged coalition of opposition parties.

In 1984, another powerful external factor, the assassination of Indira Gandhi, intervened in the December election and handed over to Rajiv Gandhi the handsomest election victory ever won by the party. The nation was in shock. It felt suddenly insecure. It found in Rajiv Gandhi the promise of national strength and cohesion, of youthful vigour and visions. For the opposition, the disappearance of Indira Gandhi from the political scene meant the disappearance of the only factor that could keep them together in the hustings. A scattered and demoralised opposition engaged in a listless campaign hurting itself more than its rival.

The Congress(I) won a stunning total of 401 seats in the Lok Sabha out of a total of 542. In the Hindi belt, it captured 204 seats compared to 139 in 1980. Commentators pronounced the 'death' of the opposition. What was ignored however, was an important footnote to the massive Congress(I) victory.

In Uttar Pradesh, Charan Singh's DMKP held to 22 per cent of the valid votes, only 7 per cent less than what it had got in 1980. It finished second in 59 other constituencies in UP, in 14 in Bihar and as many as in 10 in Haryana. Students of the 1984 election came to the conclusion that it did not liquidate the support base of the opposition parties, especially of the Lok Dal (the latest incarnation of Charan Singh's party); indeed, the core support structure of the opposition as well as the Congress(I) remained largely intact.

Even with its massive assertion of electoral supremacy in the Lok Sabha poll, Rajiv Gandhi could not restore the Congress(I) hegemony in Indian politics. Three months after the Lok Sabha poll, the electorate, freed from the trauma of Indira Gandhi's assassination, denied the ruling party victory in the states that it had already lost to the opposition parties. The party indeed lost a small state, Sikkim, without any compensation wrested from the opposition parties until in 1987 when it won a single seat victory in Tripura.

In the Hindi belt, the Congress(I) fared significantly worse in the state assembly polls than in the Lok Sabha poll with the sole exception of Bihar. In Uttar Pradesh it lost 40 of the seats it had won in 1980. The Congress(I) share of the valid votes was 39.3 per cent compared to the Lok Dal share of 21.3 per cent. In Madhya Pradesh, the opposition won 70 seats and improved its voting share to 32.4 per cent from the 1980 one of 30.3 per cent. Rajasthan gave the Congress(I) 20 fewer seats in 1985 than in 1980. The Congress(I) fared worst in Maharashtra where the most powerful opposition faction, the rump Congress led by Sharad Pawar, won 54 seats and 17.3 per cent of valid votes. Rajiv Gandhi lost Punjab, Haryana, Mizoram, Kerala and Tamil Nadu to the opposition parties in later elections.

The political management of the Hindi belt showed signs of weakness rather than strength. Bihar, Uttar Pradesh and Madhya Pradesh had three chief ministers each in four years. Rajasthan had four. Haryana's pradesh Congress(I) chief was changed as many as four times. After the party's defeat in Tamil Nadu, Congress(I) MLAS in Bihar virtually rebelled against the chief miniser appointed by Rajiv Gandhi and forced his resignation; the prime minister put Jagannath Mishra in charge of the state Congress(I) after keeping him in the wilderness for four years. Meanwhile, the electorate in the Hindi belt sent alarming signals to the Congress(I) leadership. From the 'mini-election' of the summer of 1988 to the municipal elections in Lucknow and Allahabad in 1989, the Congress(I) lost more than it won at the hands of the voters.

Withering of Congress at Grassroots Level

It is against this backdrop of electoral ebb and flow in its fortunes that the Congress(I) will be facing the electorate again before the end of 1989. Its fatal faultline is the withering of the party at the grassroots level. Districts are the mainsprings of political alignments in India's elections. The Congress was able to dominate district politics in Uttar Pradesh only with the help of coalitions of the dominant castes and communities. The Congress leadership at the state level was able to link the party to dominant rural communities. This, of course, made the Congress dependent on segments of the rich landlords.

The district base of Congress power was effectively challenged in the late 1960s by Charan Singh who weaned away the middle peasant from the dominant party. This constituency of small capitalist farmers form 30 per cent-40 per cent of the state's electorate and belongs to the backward castes. Indira Gandhi's response to Charan Singh's challenge was an effort to combine elements from the top and the bottom of north Indian society—Brahmins, landed groups, the poor and the minorities. The old pattern of aggregating power from the bottom up was abandoned. This pattern inevitably gave importance to state and district factional leaders. It was replaced by control from the top, by the supreme leader who combined party presidentship and prime ministership in a single unquestionable authority. The result was the withering of the influence of state and district leaders. Of the two, district level leaders fared worse. Those who could manage to do so, shifted their station to the state capitals. Others joined non-Congress parties. Some drifted away to business or other occupations. District Congress committees existed only in name during Indira Gandhi's later years as prime minister.

These have not been activated by prime minister Rajiv Gandhi. In his four-and-a-half years and more, even some of the pradesh Congress committees became defunct. It was only in late 1987 that Rajiv Gandhi turned his attention to activisation of pradesh Congress committees. But his failure to hold party elections left him with the lifeless bodies of totally nominated pradesh and district committees. It is doubtful if these bodies and their office-bearers will be of much help to the prime minister in mobilising voters and bring them to the polling booths on election days.

No extraordinary external factor is likely to intervene to create a pro-Congress(I) wave before polling day. A war with Pakistan is as unlikely as one with China. Indeed, with both countries India's relations are on the mend, relieving the security scenario of considerable pressure and denying the national security elite the pleasure of spinning worst possible scenarios to scare the voters.

There is, of course, a dim law-and-order situation in Kashmir, with pro-Pakistani elements playing their role. But the sharp decline of political order in Kashmir is the result of the political-power sharing pact between Congress(I) and the National Conference. It is unlikely that Pakistan will get involved in subverting Indian control of Kashmir before the election or that tension and conflict plumbers at the disposal of the ruling party will be able to build up a threat scenario that will push the voters *en masse* to the polling booths of the Congress(I). At the worst, the centre may put off the election by a few months, thereby hurting its own credibility as winner of the grand contest.

All indications, then, point to a normal 'mirror' election between the autumn and winter. It will also be the most bitterly fought election so far, with no holds barred in the felling of contestants. Invectives will fly like poisoned arrows. Characters will be assassinated freely. Rhetoric of abuse and insult will be hurled in abundance. The dirty tricks department of the ruling party will come up with charges against opposition leaders that are meant to outrage the voters. The opposition will strain its own resource to reply in kind.

These are the wages that the country will have to pay for the final withering of the single dominant, hegemonic party rule. Hopefully, it will rally soon after the election drawing upon the inherent strength of a democracy, the life-force of the nation. No nation's political journey has ever been roses all the way. Landslides, storms, disasters have to be faced and won. India is now in tryst with hard but exciting times.

NEW DELHI

Battle for Self-Reliance in Telecommunications

B M

There are scores of hastily negotiated foreign collaboration deals and dubious import arrangements. Hence clearing the field for indigenous technology and infant production capabilities will be a difficult task.

'MISSION better telecommunications' was launched by the department of telecommunications of the union government as far back as in April 1986. It was subsequently renamed the National Mission on Telecommunications and brought within the ambit of the so-called Technology Missions under the leadership of Sam Pitroda to tackle on a priority basis some of the country's critical societal concerns. Unlike the missions for adult literacy, immunisation and drinking water, the telecom mission was, however, admittedly urban-oriented, even though it was supposed to give special attention to rural communications as well. It was also admittedly the only true *technology* mission in the original sense of the term since the key factor to be brought into play was the introduction of modern digital technology and computerisation in the telecom network. Further, it was a mission which had to be implemented entirely by the central government and the state governments had hardly any role to play.

These specific features of the Telecommunications Mission also determined its scope and priorities. The emphasis to begin with was placed not on the revamping of the entire telecommunications system in the country but improving the quality of service in certain high density sectors in the system, in particular Bombay and Delhi. But the improvements which were proposed to be made were, by the very nature of things, difficult to define or quantify even while the system as a whole tended to decay. The evocative aim of ensuring 'customer satisfaction' was bound to remain elusive. The attempted shifting of priority from increasing what is called density to accessibility failed to make much impression when actually the waiting list for telephones tended to increase at a fast rate. So far as the attempt to improve or enlarge rural communications was concerned, it was inspired by the idea of field testing the C-Dot technology which had been developed during the first leg of Sam Pitroda's technological enterprise after his return to India four years ago. This was expected to pave the ground for wider application of C-Dot technology. The 'C-Dot/RAX Every Day' programme launched in 1988 was intended to be a demonstration of the priorities—self-reliance, customer satisfaction, accessibility—that were claimed to guide the technology mission on telecommunications.

The setting up recently of the Telecommunications Commission with full government powers with Sam Pitroda taking administrative charge of the department of telecommunication as its secretary and by virtue of that occupying the office of the chairman of the Telecom Commission has, however, been claimed to mean that the period of tinkering with the system was over and that the revamping of the entire telecom system had been placed on the agenda. The Telecom Commission may, therefore, be said to have taken over and submerged the technology mission on telecommunications. The celebrated C-Dot project of Sam Pitroda will also shortly lose its separate identity and be merged with the telecommunications research centre of the department of telecommunications to form an autonomous society for R and D purposes under the umbrella of the Telecom Commission. These developments have naturally called for reordering of priorities, establishing new balances and refining linkages in the development of the telecommunication system on a sound techno-economic basis.

The aim of the Telecom Commission as proclaimed by its chairman is to promote technological self-reliance and indigenous production capacities. Imports for the telecommunications sector are planned to be cut to less than 5 per cent of the products that go into the system. The expansion and modernisation of telecommunication services so that they become available on demand and give reasonable satisfaction to the customer is proposed to be achieved on this basis. These are commitments publicly made and have to be honoured. The Telecom Commission claims to have got down to serious business at once with wide-ranging policy and management initiatives, evidently made possible because Sam Pitroda had framed and experimented with a policy package and programme of action well in advance through his work in C-Dot and in the Technology Mission on Telecommunications. Pitorda, it is claimed by those close to him, is now ready to grapple with his wider and larger responsibility of revamping the telecommunications system as a whole. This unquestionably is an important and daunting task of far-reaching significance. The telecommunication system, after all, is a very important service industry.

The setting up of the Telecom Commission, which will plan and co-ordinate the development of this vital service industry, is indeed being proclaimed as the starting point of another 'revolution', the telecommunications revolution. Sam Pitroda is said to have wrested, after a fierce tussle, the office of chairman of the commission from the bureaucracy entrenched in the department of telecommunications (DOT). This is supposed to mark a significant victory of the technocrats over the bureaucracy in the official set-up. But the winding up of the Electronics Commission at the same time must not escape notice. The ways of the government headed by Rajiv Gandhi have always been wayward and are not necessarily influenced by rational criteria. The power of the bureaucracy in the system must not in any case be underrated. This is relevant as much to the telecommunications sector as to the other sectors of industry or infrastructure. Also, the telecommunications ministry remains, even though the Telecommunications Commission is supposed to be invested with full government powers. When the commission was formed a cabinet minister was still in position. He was not expected to cool his heels in that position and merely answer questions in Parliament. Sam Pitroda, after all, is chairman of the commission by virtue of being secretary to the department and not the other way round. The bureaucratic machine thus remains intact even in the telecom department.

Sam Pitroda has reiterated, after taking over charge of the Telecom Commission, his commitment to technological self-reliance, promotion of indigenous production capacities and capabilities and cutting down of imports of products and technologies that go into the telecommunications system. This commitment has, however, been regarded by many with a great deal of scepticism. The past record of the department of telecommunications is hardly reassuring. A problem that is bound also to arise in this context is that any slippage or lag in the indigenous effort for whatever reason will be exploited by the import lobby and the entrenched bureaucracy to deride indigenous efforts and achievements and to reverse the policy direction. The Telecommunications Commission indeed does not have a clean slate to work on. The telecommunications system is badly tangled, held together by incompatibles and cluttered with imported technologies, systems and products.

There are scores of hurriedly made foreign collaboration deals and dubious import arrangements both in the public and private

sectors. It is going to be a difficult task to clear the field for indigenous technology and production capabilities, still in their infancy, to take over and accelerate the expansion and modernisation of the telecommunication network. Will, for instance, the import orders and collaboration deals already made be simply cancelled? It is not going to be easy to get round them either. The complex bureaucratic procedures will take some doing to overhaul. A time-table is claimed to have been set for new tasks and new approaches for R and D, training of personel, farming out of orders for supplies to indigenous enterprises in the country, weeding out of wasteful investment proposals and concentrating on key products—-20 to 30—which are proposed to be produced efficiently in large volumes. How the proposed time—table will work out in practice is yet to be seen.

It is contended in many quarters that it will not be possible to curtail imports to any appreciable extent because domestic production is not picking up at a fast enough pace and there is a plethora of foreign collaboration and import arrangements to meet the pressing demands of the telecom network. There are as many as 113 such collaboration arrangements. Some of them are proposed to be made infructuous by simply not placing any orders on these sources. But many are bound to muscle in on the telecom scene. C-Dot is still not ready to productionise its technology in a big way and end dependence on imported digital switching systems. The Mahanagar Telephone Nigam was set up to expand and modernise at a fast rate telephone services in Bombay and Delhi is also going to pose problems. The lean resources available for investment in the telecom sector, as in all other sectors, have tended to be foreclosed for the modernisation of telephone services in the two metropolitan centres of Delhi and Bombay, the political and business capitals respectively, as it is said, of the country. Even Calcutta and Madras stand divested of their claims on the telephone map of the country. The elitist orientation of the management of the telephone services was indeed embodied in the very charter of the Mahanagar Telephone Nigam. This is very much in tune with the overall development philosophy of the present establishment which, besides its many other features, has a marked weakness for spectacles and extravaganzas at selected points while the national scene as a whole remains drab and depressing.

The moves initiated by the Telecom Commission immediately after its constitution have been rather striking and may even be said to be in tune with the proclaimed commitments of Sam Pitroda. The planning commission has been informed that the proposals for the development of the telecom network during Eighth plan would be reviewed and a modified plan for the telecommunication sector would shortly be prepared and presented. Significant in this context is the decision not to import any switching technology. The telecom development and expansion programme is planned to be based solely on C-Dot technology. The Telecom Commission has also found enough indigenous capacity to meet the target of commissioning 1.5 million lines yearly after 1990-91. C-Dot has given licences to 40 units for manufacturing 20,000 lines each annually. In the small-scale sector alone there exists a capacity to manufacture 6 lakh lines a year. The public sector unit at Mankapur also has a licensed capacity to manufacture 1.5 lakh lines annually. The other two units at Raebareilly and Bangalore have a combined capacity to manufacture 1.5 lakh lines. The country is, therefore, well equipped to manufacture its switching requirements. C-Dot's larger exchanges, with above 2,000 lines, are under test. They are likely to go commercial in another six months. The Telecom Commission proposes to set up four regional production units for the manufacture of larger exchanges of 8,000 lines and above based on C-Dot technology to meet the demand of the larger cities.

The Telecom Commission has also articulated reservations on the utilisation of the World Bank's $350 million loan negotiated in May 1987. The commission wants to renegotiate the loan terms with the World Bank in order to provide for import of components instead of the products listed in the agreement which can be manufactured indigenously. Import of products under the Bank loan, it is being argued, will be detrimental to the development of the domestic telecom industry. It is felt that if the Bank refuses to consider re-negotiation, the loan should not be taken. The World Bank had extended the loan to finance imports for upgrading the telecom network in the four major cities and the long distance links among them. $150 million have already been drawn for import of cables, jelly-filled cables and certain other equipment. But these products can be manufactured indigenously. Hindustan Cables in the public sector is in fact operating at only 60 per cent of its capacity due to lack of orders. The Telecom Commission has, therefore, called for a review of the agreement.

The commission has also decided to activise established capacities in the private sector also for the indigenisation programme. It proposes to procure one-third and eventually one- half of telecom equipment from the private sector during the Eighth Plan period. It is reported to have estimated that the total equipment needs including switching, transmission, terminal and ancillary equipment will be worth Rs 19,240 crore in the next five years, out of which orders worth at least Rs 7,000 crore can be farmed out to private sector firms. This is expected to encourage investment in the manufacture of the equipment. The three public sector companies--Indian Telephone Industries (ITI), Bharat Electronics and Electronics Corporation of India (ECIL)—can be relied upon to take care of the rest. A detailed list of the equipment, com-

ponents and systems required has been drawn up. A meeting with representatives of private industry was held some time ago to discuss the procurement programme. They were asked to take advantage of the procurement plan and discuss their problems relating to the manufacture of switching, transmission, terminal and ancillary equipment. Rough estimates show that industry in the private sector is utilising hardly 60 per cent of its installed capacities.

The ability of the Telecom Commission to maintain the momentum and fulfil its promise will, however, be determined by many imponderables outside its ambit and control. It is likely to encounter many adverse influences and pressures. Already, for instance, when the prime minister, very eager to make all kinds of populist noises and gestures, called for instant installation of telephones for village panchayats, Sam Pitroda was persuaded to respond without due examination of the proposition on a sound techno-economic basis. The development of telecommunications must not be allowed to be influenced by the political populist concerns of the ruling establishment; it must be governed by sound techno-economic and commercial criteria.

Sam Pitroda himself is known to enjoy the confidence and support of the prime minister. His position as the prime minister's technology advisor with the rank of minister of state has given him stature and clout in the ruling coterie. His appointment as secretary of the department of telecommunication by virtue of which he is also the chairman of the Telecommunications Commission is, however, protocol-wise rather odd. A departmental secretary holding at the same time the rank of minister is an unconventional arrangement. But such things pass in Rajiv Gandhi's regime. Sam Pitroda who returned to India four years ago is noted for his expertise in telecommunications. He plunged straight away into development of indigenous technology and its application to India's bedraggled telecommunication system. Those who have watched him at work in C-Dot feel that it could give a decisive start to the upgradation of India's technological standards and capabilities not only in the telecommunications sector but more generally. These hopes were strengthened when Sam Pitroda declared that the R and D labour of his team had laid the ground within a relatively brief period of three years for the commercial application of C-Dot technology for developing and spreading the telecom network both in the urban and rural areas in the country.

But there are some disturbing signals which must not be missed. Sam Pitroda likes to proclaim from time to time a set of priorities for the development of technological self-reliance. He, to begin with, strongly and openly opposed the import of telephone systems from diverse sources—Japan, France, Sweden—which would go against standardisation and economies of scale and rob C-Dot of competitive advantage and destroy its role in the development of India's telecommunication system on a self-reliant basis. However, the powerful import lobby and entrenched bureaucracy in the department of telecommunications went ahead with collaboration deals with foreign interests. A flash-point in these developments was the decision of the telecommunications ministry to import cellular radio mobile telephones or car telephones which Pitroda was bitterly opposing as wasteful. Pitroda suffered another setback when the government decided to spend precious foreign exchange, and that too in a drought year, to import push-button telephones even when capacities existed, albeit with foreign collaboration, for their manufacture in the country. What was ironic was the fact that the import lobby received a boost when the prime minister personally found time to visit a plant in Sweden manufacturing car telephones and made a call to the then secretary, department of communications, from there. The fact is that Pitroda's role as technology advisor to the prime minister has not been as effective as some like to believe. It visibly suffered after he stepped out of the quiet confines of C-Dot and was ready to apply the results of his R and D effort in competition with powerful transnational corporations. This position stood out starkly when Pitroda tried to seek the support of the Indian engineering industry to formulate what he called a charter on technology policy and priorities which he intended publicly to present to the prime minister. The prime minister in his address to the annual meeting of the Confederation of Engineering industry after his visit to Tokyo, however, chose to applaud the special role of foreign capital and technology which mocked at Pitroda's advice.

Pitroda is emphatic that while enterprises based on internal competition may be encouraged in all areas, there is need to protect indigenous enterprise from foreign competition. The prime minister, on the other hand, favours an open door policy for foreign technology and capital. It is not fortuitous that the sensitive area of telecommunications has been an arena of fierce competition from foreign interests. Will this position be corrected in telecommunications at least after the setting up of the Telecommunications Commission headed by Pitroda?. The trouble is Pitroda likes to stand apart from and above the system through which he must function.

In many important areas of industrial and technological enterprise in the country, among them notably fertilisers, steel and heavy electricals, indigenous R and D effort and production capabilities have been emasculated in the past by relying on imports, investment of foreign capital and so-called sophisticated foreign technology. The political leadership, devoid of any wider vision and commitment to the larger interests of the country and the people, has been the spur for perpetuating this state of affairs. The position in this respect has only worsened in recent years.

Pitroda at the head of the Telecom Commission can indeed be made to look silly with his public commitments to self-reliance and minimal imports, for he seems to have hardly any influence on the Rajiv Gandhi government's decision-making process working in favour of foreign technology, foreign capital and liberalised imports. Other distinguished scientists and technologists and experts in various fields have suffered at the hands of the entrenched political power system after basking briefly in glory as private advisors chosen by the prime minister and have been unable to influence official policy along the lines which they proclaim. This is not entirely because of the flippant style of functioning of the prime minister. The fact is that there are powerful influences working behind the scenes which turn official policy in favour of foreign capital and multinationals and control its implementation.

What is also disconcerting in this context is the clever manner in which Pitroda's position and role in R and D work in the telecommunication area has been tended to be diluted. He has been pushed out into areas unfamiliar to him. The so-called 'technology missions' for adult literacy, rural drinking water, immunisation of children and pregnant women, production of oilseeds and dairy development which have been entrusted to Pitroda for implementation are no *technology* missions at all which fall within the domain of his technical expertise. These are admittedly important societal missions of the highest priority. Sam Pitroda readily admits that he has little understanding of Indian society and is not even a serious student of the social and political forces at play in India. The very idea that the application of modern technology and management tools through the bureaucratic-administrative set-up can be relied upon to achieve results in solving societal problems which involve large masses of people is indeed quixotic. Acting on this basis will give, in the absence of structural reforms in society, results opposite to what are claimed as the ostensible purpose of the technology missions which are being carried out with much fanfare but not with impressive results. Pitroda, however, seems to be so much under the spell of his messianic role that he does not hesitate to declare that if he had to choose between the so-called technology missions and the Telecommunications Commission, he would opt for the missions. This speaks poorly of his perception of Indian socio-economic and political reality, for it would be a pity if he allowed himself to be deflected from his true calling of a technocrat and a specialist in his own field of telecommunications. Just now nothing would suit the interests of the telecommunications multinationals and the import lobby within the country than to get him bogged down in the technology missions so that his clout in the telecommunications sector is minimised.

Politics of a Food Crisis

Ashim Mukhopadhyay

Whereas the West Bengal public distribution system requires a lakh and a half tonnes of rice per month the centre's allocation has been far short of this amount. The state government's note to the centre intimating the required amount elicited a peculiar response—a further reduction of the state's share.

A SEVERE crisis confronts the public distribution system (PDS) in West Bengal. There is an acute shortage of foodgrains in both the statutory and modified rationing areas, a problem, almost without precedent since the introduction of the system. To make the situation all the more critical, a substantial portion of the cereals released so far from the central pool is reported to have been labelled as unfit for human consumption or sub-standard by the state food department. While the matter is still under investigation, one can hardly ignore the sentiments of the hundreds of thousands of consumers throughout the state affected by the quality of the rice or wheat they are being forced to accept for their very survival.

It may be mentioned that on July 20 last, the state chief minister, Jyoti Basu handed over three small packets of rice meant for the PDS to the Pradesh Congress(I) president, Ghani Khan Chowdhury who called on him at his chamber. Basu requested Chowdhury to place the samples before the union minister of state for food, Sukha Ram and urge for action against the concerned Food Corporation of India (FCI) officials who dared supply such 'harmful' material. Chowdhury carried the rice packets to New Delhi, but reportedly got no definite answer from the food minister. Anyway, when Sukha Ram himself came down to Calcutta on August 5, he said the rice shown to him was collected intentionally by the state food minister, Nirmal Bose from an FCI stock, marked unfit. Though Sukha Ram has pushed the ball into his opponent's court, the fact should not be forgotten that as a partyman, Chowdhury is not a friend of either Basu or his food minister. Had he not been convinced about the authenticity of the contents of the packets given to him, he would have been the last person to carry it to the centre.

As for the Left Front government, things are steadily deteriorating. In the statutory rationing areas under the PDS, comprising greater Calcutta and the industrial areas of Howrah, Hooghly, North 24-Parganas, Asansol and Durgapur, more than one crore of people are awaiting their weekly supply from 2,745 fair price shops. More than five and a half crore in the remaining parts of the state are fed by modified rationing through 17,045 shops. Nowhere, is the supply adequate and the consumers are far from satisfied about their standard.

A high official of the state food department told this correspondent that whereas the PDS's monthly requirements were 1,50,000 tonnes of rice and 1,30,000 tonnes of wheat, the union government had been allocating 1,25,000 tonnes of rice and 1,26,000 tonnes of wheat for some time. The state government sent notes emphasising its actual need, but in vain. On the contrary, since February, 1988, according to the official, there was a further cut in the supply. By June, the same year it went down still further and since February this year, the monthly quota of rice for the PDS has been reduced to a mere 64,000 tonnes. The monthly allocation of refined rapeseed oil has also been drastically slashed down, from 20,500 tonnes in December, 1987 to 4,100 tonnes in February, this year. In regard to the supply of levy sugar also, the state does not receive its due share. Against the annual requirement of 4.8 lakh tonnes, the supply from the central pool has been around 3.10 lakh tonnes, and the actual arrival has been even less. As a result of such a heavy reduction in allotments, the scales of distribution for foodgrains, edible oil, etc, had to be cut down drastically by the state government, according to the official.

Another aspect of the present crisis is that there is a steady rise in administered prices of rationed articles, though the matter has repeatedly been brought to the notice of the union government. For instance, the price of rice was enhanced as many as seven times within the period October 5, 1982 to January 25, 1989; wheat six times between April 1, 1981 and March 25, 1988; levy sugar eight times from November 15, 1981 to January 1, 1989; refined rapeseed oil five times from February 17, 1982 to September 1, 1988 and kerosene four times from July 11, 1981 to February 5, 1986. "It appears therefore that the centre is not at all interested in helping the PDS in West Bengal, but determined to destroy it", said an official.

This correspondent visited several villages in the South 24-Parganas, Howrah, Hooghly and Midnapore districts and tried to read the mood of the people, mainly those belonging to the poorer sections of the rural community, small peasants, sharecroppers, day-labourers and class IV employees of various government offices, whose meagre earnings have forced them to depend solely on the PDS. Almost everywhere, the ration shops have brought down the scale to half of the actual individual quota. But there is no other alternative. Buying in the open market seems to be a luxury for an office-peon or a marginal farmer. Heramba Das, a day-labourer at Suryapur Hat, near Baruipur in the South 24-Parganas said that there was plenty of rice in the stalls, but even the cheapest variety seems to be beyond his reach as it sells at Rs 5 a kg. Heramba earns only Rs 15 per day and requires at least 3 kgs of rice to feed six people including his wife. His has other requirements also like cooking oil, salt, sugar and fuel.

Indeed, the price of rice is shooting up unchecked throughout the state. From fertile and surplus districts like Burdwan, Birbhum and West Dinajpur to drought prone and scarcity zones like Bankura, Purulia or Howrah, the picture is almost equally depressing. Everywhere, the farm-hands prefer payment in kind because of the poor performance of the PDS and the steadily increasing price of rice and wheat in the open market. At Polba in Hooghly, this correspondent came across scores of day-labourers who would not accept their wages in cash. "Currency notes have no value, at least for the time being. Give us rice and wheat. We want to survive", said Bhagaban Kurmi, a Santhal youth who works as a farm-hand to a local small peasant. According to Bhagaban, his employer understands his problem, but because of his own financial limitations cannot meet his demands regularly. Indeed, rice has become a costly commodity in rural West Bengal, creating more pressure on the village economy than it did in the recent past and thereby causing much social tension and embittering relations among the peasants. At Memari, a middle peasant grumbled over his farm-hands' insistence for payment in kind instead of cash. "I am a poor man. How can I give them rice everyday. Sub-standard rice is not available in open market. I must maintain a quality while paying my employees in kind and this eats up my profit as well as my personal stocks."

Everywhere the panchayat office-bearers and the local leadership of the Left Front are campaigning for payment in kind. Almost everywhere the cultivators are grudgingly accepting the 'verdict', but at places where the employers are too hardpressed or have a good rapport with the panchayat members or local party workers, payments are made partly in

kind. The situation is easily understandable. The failure of the PDS has hiked up the price of rice. In Calcutta, Howrah city and other statutory rationing areas rice is being sold at unreasonable prices. Even the cheapest or the worst variety sells at Rs 5.50 a kg. Small traders at Garia, one of the major wholesale and retail markets in the South 24-Parganas, said that big businessmen have hoarded huge quantities of rice with a view to pushing up the prices further and making bigger profits. They claimed that although the district administration and the police are aware of the mischief no definite action has yet been taken to punish the offenders.

In the statutory rationing areas in greater Calcutta and Howrah consumers are apprehensive that the situation will take a turn for the worse during the coming Durga Puja festival. During the festival last autumn (1988) there was practically no rice in almost the entire south Calcutta for more than a week. The state government held several rounds of talks with the FCI officials and sent urgent messages to the centre, but things did not improve. Scarcity of rice marred the festival.

Given the crisis, the state food minister, Nirmal Bose has decided to buy rice from Haryana and Andhra Pradesh. The quantum to be bought, has not yet been fixed. This however, failed to impress Sukha Ram much who feels that the Left Front government has contributed least to the national food stock and yet demands the 'largest share' out of it. And, during his recent visit to Calcutta he virtually plunged into a war of words with his counterpart in the state government and blamed the latter for politicising the issue. Sukha Ram insisted that in view of the continuing droughts and floods in different parts of the country, West Bengal would have to accept relaxed specifications of rice for its PDS. He claimed that it was not the cut in the quantum of supply by the centre, but the state government's sheer mismanagement that has actually deepened the crisis.

Whatever be the assessment of the union food minister, the question that confronts the man on the street is whether the state government can tackle the situation on its own. It is a fact that the state has to feed more than eight per cent of the national population, while having just 2.7 per cent of the country's total geographical area. Yet, as the state government itself claims "against the target of 105 lakh tonnes in 1988-89, the production of foodgrains is expected to cross the target. This has been made possible by the sincerest and relentless endeavour of Left Front government" [*12 Years of Left Front Government in West Bengal*, a state government publication, June 1989, page 60]. The handbook goes on to say: "During kharif 1988 season it has been possible to increase the production of kharif rice to an unprecedented level of 86.08 lakh tonnes by taking advantage of favourable weather conditions" (page 60). At another place the handbook says: "increase in the productivity of Aus rice is another all-time record in 1988-89. As compared to that of the previous year, the productivity has increased by 40 per cent and total production has gone up to 10.7 lakh tonnes. This represents an increase of more than 64 per cent over 1987-88" (page 61).

If the situation is so bright, why does the state government depend so much on supply from the central pool for the sustenance of its PDS? Why does not it feed the system on its own? And why is it a perennially deficit state? There is another more vital question, cannot the state government impose levy more vigorously on the producers and establish its PDS on an even keel. Under the old system of percentage levy, it was necessary to hand over 50 per cent of produce. At present under the 'contractual levy', only 25 per cent of the yield has to be surrendered. Frankly speaking, most of the producers are violating the contract and evading payment of levy. They are selling rice and minting money. This year's levy target is only 1,40,000 tonnes against an estimated production of over 10 million tonnes and the collection made so far is only about 94,000 tonnes. In 1966, when the total yield was far less, the state witnessed a record procurement of 600,000 tonnes. Whether the Left Front government would pursue the policies of Prafulla Chandra Sen, the then Congress chief minister is, however, a different question. But the truth is that the system of levy, if properly implemented, can be quite helpful in creating a buffer stock to sustain the state's rationing arrangements.

Nowhere in the state is the 'contractual levy, collected with sincere effort. For instance in Burdwan, against a procurement target of 66,000 tonnes only 47,400 tonnes have been collected so far and in Birbhum, only 13,500 tonnes have been collected against a target of 19,600 tonnes,—a target which is much below actual production. Since most of the rice produced in the district is smuggled to Nepal, via Bihar, and Bangladesh, via Murshidabad, neither the state government nor the district authorities should have taken such a lenient attitude towards the producers and traders eating up the profits.

The existing levy system yields practically nothing in the districts of Malda and west Dinajpur, two other fertile zones. No levy has been collected from Malda for about 12 years, as the rice mills there are reportedly not functioning, while in west Dinajpur, rice millers have stopped paying levy since April 26 this year, following a court order. But where does their produce go? Does it sell in the local market at reasonable rates? If so, why do the poor people, mostly marginal farmers, day-labourers and village artisans go without even one square meal a day and why do they migrate to the nearby towns in search of jobs and finally how do truckloads of rice cross over to Bangladesh under the very nose of the Border Security Force and the local police.

The state government, it seems, does not want to be too strict about the collection of levy. As far as the CPI(M) is concerned, its village-based leadership argues that a direct levy has become obsolete, because there is hardly any big farmer left in the countryside. This is apparently true, but the real picture is something different. Individually, there may be only a few big farmers, but land has been evenly distributed among dependable relatives and friends to evade payment of levy, taxes and various other obligations.

That the centre's attitude towards the non-Congress(I) states is far from friendly, is an open secret and that West Bengal is a deficit state in almost all essential commodities including foodgrains is also a fact, admitted openly by the present state government. Yet, since the ruling Left is committed to strengthen the PDS, "for the benefit of the common people and also to curb price rise to a certain extent", it has to take measures to plug the loopholes. There has been a phenomenal increase in the number of both rice and husking mills throughout the state. The mushrooming of the husking mills has been spectacular. State food officials say that there are about 92,000 licensed husking mills in the state and about as many unlicensed ones. Withdrawal of percentage levy and lack of cordoning and strict vigilance by the government has encouraged the owners of these mills to do as they chose . According to the headmaster of a school at Bongaon in the North 24-Parganas district, "husking mills have become a haven for the rural unemployed just as construction of unauthorised buildings tends to be for their urban counterparts in Calcutta". Unauthorised purchase and sale of paddy and rice, by the millers, particularly, the husking mill owners and their clandestine business of smuggling of rice to Nepal and Bangladesh, has created a shortage amidst plenty and thus kept the common man both in urban and rural areas hungry. Those who argue that a direct levy or strict control over the existing levy will raise the price of rice, ignore the truth that, levy or no levy, prices are steadily increasing and that had there been any definite

policy, the state would have a much bigger stock at its disposal .

Every day, tons of rice and paddy loaded in trucks and bullock carts sneak into Bangladesh from the border districts of the North 24-Parganas, Murshidabad, Nadia, Malda, West Dinajpur, Jalpaiguri and Cooch Behar. It is useless to blame the Border Security Force, Bengal Police and other agencies guarding the international border when the state government itself has not had any definite policy about procurement or stoppage of smuggling. The smuggling of essential commodities from West Bengal to Bangladesh has another harmful effect. Both the centre and the state government should note that the continuation of smuggling will benefit the military rulers of Bangladesh who have not yet been able to give the country a sound economy.

The present rice controversy and the crisis of the PDS has also exposed the differences within the Left Front. The CPI and the RSP, two major constituents have openly criticised the government's procurement policies and were later condemned for their action by the Front chairman, Saroj Mukherjee, who also happens to be a key man in the CPI-(M)'s state committee. Significantly, the Forward Bloc, another major partner and an equally vocal critic of the CPI-(M), did not join in the anti- CPI(M) campaign this time, the reason being obvious. They have their own man holding the food portfolio. Anyway, the irony is that each of these parties has thousands of unauthorised millers and clandestine business rackets under its patronage, and is obliged to serve its respective vested interests when required.

MADHYA PRADESH

Group Warfare

Urmila Singh's removal has sparked off another round of confrontation between the Arjun Singh and Motilal Vora factions just when the high command was keen on putting an end to the infighting in the state unit of the party.

URMILA SINGH, the demure chairperson of the Madhya Pradesh Social Welfare Advisory Board, had gone to Bhopal's Raj Bhavan to invite the governor to inaugurate a seminar of women sarpanches. Even as the meeting was taking place, high drama was being enacted at the office of the Social Welfare Board, two km away. A plump, middle-aged lady reached the office, armed with an order issued by the state government a day earlier, and told a surprised secretary of the board that she had come to 'assume charge of chairmanship'.

The lady, Paratibha Chauhan, a Congress(I) activist of Durg, chief minister Motilal Vora's town, did not even extend the courtesy of awaiting the incumbent and accepting charge from her. Neither did she wait for the official copy of the order to be delivered through the proper channel to the board. She was in a hurry to occupy the post, as were the other Vora supporters who accompanied her. For them it was a coup.

Urmila Singh, a Congress(I) MLA, learnt of her ignominious ouster only when board officials swooped on her house that afternoon to whisk away her car and other facilities. She says: "I was taken by surpirse". Her supporters are both surprised and angry. It has triggered off yet another round of confrontation between the Arjun Singh and the Vora groups in the ruling party. For Urmila Singh, appointed chairperson during the previous regime, is considered a supporter of Arjun Singh, while her succesor belongs to the Vora camp. There is consternation in the dissident camp that her removal may be the beginning of the process of replacement of many more chairpersons of various autonomous corporations and boards appointed by the previous regime.

That indeed was Vora's design. It is understood from reliable sources that he has already prepared a list of chairpersons who have to be axed. Most of them, predictably, belong to the dissident lobby. But in view of the rumpus created by the dissidents—they have threatened to take up the issue with the prime minister—he has now decided to go slow. He told a supporter that one change had caused enough commotion for the time being. Obviously Urmila Singh's removal was a test case.

But it was the worst possible choice for a test case. Urmila Singh was the first tribal chairperson of the board in its 36-year-long existence. Says a former minister: "It betrays Vora's contempt for harijans and tribals". Besides the board had done excellent work during her ten-month old tenure. Said an inspection note by the women and child development department of the central government in February this year: "The MP State Board is the best functioning unit of all. It is the only one to have achieved a success in the economic development programmes for women."

Although the Madhya Pradesh government denies any political motivation behind the change, the manner in which she was shunted out leaves little doubt that she was penalised for her loyalty to Arjun Singh while Chauhan was rewarded for belonging to Vora's camp.

Urmila Singh's appointment for a three-year term in September last year was already approved by the Central Social Welfare Board. The state government had also forwarded a list of 21 persons for New Delhi's approval on December 8 last. meanwhile the government changed. But the Central Social Welfare Board approved the old list on April 20 this year and sent it back to the state government for notification.

Instead of issuing a gazette notification, Vora sent another list to the Central Social Welfare Board and finally manipulated to get it approved last month. So secret was the operation that even the department's minister, considered close to the dissident camp, was kept in dark. The chief minister directly passed the order. The minister, Ganga Potai, learnt of the change only after the official announcement.

To make the matters worse, the new board is not a very representative one. Normally, there is supposed to be a continuity in such panels because social workers are not born overnight. But in Vora's list of 26 nominees, only two are old members. The Malwa region has no representation and eminent social workers like Shalini Moghe have been ignored for the first time. Indore, which gets 50 per cent of the grant distributed by the board in the state, does not have a single member.

The dissident MLAs, who met in Arjun Singh's presence recently in Bhopal, complained that Urmila Singh's removal smacked of groupism and political vendetta. The tribal MLAs are planning to call on Rajiv Gandhi to lodge a formal complaint.

Surprisingly, Vora's offensive has come at a time when there are clear signals that the high command now wants to put a stop to infighting in the party in the election year. The replacement of MP Congress(I) Committee chief Chandulal Chandrakar by Shivbhanu Singh Solanki is a clear indication of the new direction.

The dissident camp was pressuring the high command for Chandrakar's removal for quite some time. So he had to go. But his successor is not the dissident's nominee. Neither does he belong to the Vora camp. Solanki is considered non-partisan in the state's group politics. Apparently, in the new phase, the high command would like the two warring factions to train their guns elsewhere. But that is unlikely to happen.

Restructuring Socialist Ownership

Ramnath Narayanswamy

The two phases of the Gorbachev reform show that a process of reform can never be a smooth programme moving along a pre-determined trajectory. On the contrary the process is often contradictory and inconsistent leading either to amendments of the original reform blueprint or to a redefinition of reform objectives themselves.

"THE expression 'social ownership'", wrote Alexander Zinoviev, the Soviet emigre philosopher, "is a logical nonsense. Even in cases where the collective appears to be the proprietor, this is simply a special case of private property; and it is best simply to say 'property' because the expression 'private property' is like the expression 'bread and butter with butter'. In the USSR, the land was given to the collective farms for 'their eternal use'. But the collective farms did not become collective proprietors as a result of this, for they could not sell their land, they could not even manage it at their own discretion."[1] Written by an outspoken anti-Stalinist who came under increasing harassment as a result of which he was finally expelled from the Soviet Union in 1978, these lines could have well been penned by anyone of the numerous protagonists in favour of radical reform who have sprouted in the wake of the Gorbachev offensive. The current phrase—state property is treated as nobody's property—is simply another way of officially affirming that the much-vaunted institution of socialist ownership has effectively become a positive impediment—in the Soviet and east European context—to substantive economic reform.[2]

State ownership, it may be recalled, has for long been considered to be the central pillar of the traditional economy of the Soviet-type—in conjunction with centralised planning and one-party dominance, these three features were canonised in the tortuous evolution of that body of doctrine which until recently went under the name of the 'political economy of socialism'.[3] The fact that this entire body of doctrine is today being repudiated in not only the USSR but other parts of eastern Europe (e g, Poland and Hungary) as well is an instructive commentary on the extent to which the pattern of official discourse has undergone a change in the socialist economies of eastern Europe. This change is perhaps nowhere more evident than in current discussions on the nature and future evolution of state ownership.

Two Phases of Gorbachev Reform

It might perhaps be useful to consider the Soviet debate on resource ownership by first locating it within the context of current reform initiatives in the USSR, especially because the Gorbachev reform must not be viewed as a comprehensive package of measures aimed at simultaneously transforming several aspects of Soviet society here and now, but must rather be seen as an incremental reform process that will inevitably involve several years—even decades—to bring to fruition. Indeed, the very manner in which the reform in the various sectors of the economy and society has been evolving under Gorbachev certainly does much to reinforce this impression.

The entire reform programme was itself not radical to begin with, that is to say, Gorbachev did not begin his tenure as a radical reformer. This is especially true of his first year in office (early 1985 to early 1986) when most of his proposals and actions, despite their encouraging tone, did no more than skirt the surface of the traditional model of state ownership and centralised planning. While calling for decentralisation of economic management, greater enterprise autonomy and more reliance on incentives, Gorbachev carefully avoided the use of the term 'reform', preferring to describe his measures as being directed towards 'perfecting' or 'improving' the economic system rather than substantively overhauling it.

During this period, attempts were made to reinvigorate the economic leadership by replacing ageing ministers, initiating a variety of campaigns against social vices, emphasising decentralisation and reducing the powers of the central bureaucracy. Gorbachev set faster economic growth rates as a priority goal. He called for a big increase in investment in machine building to accelerate the pace of modernisation in industry. The Gosagroprom (the state agro-industrial committee) which replaced a number of agricultural ministries and state committees was created in 1985. In fact, in a speech delivered in Kiev on June 27, 1985, Gorbachev even appeared to assume a strong anti-market posture by declaring that "our approach is to use the advantages of planned development" and "it is not the market, not spontaneous forces of competition but, primarily the plan which should determine the main aspects of economic development".[4]

It was only in early 1986—almost a year after assuming office—that Gorbachev chose to reveal his radical credentials at the Twenty-Seventh Party Congress by specifically referring to not only 'reform' but emphasising 'radical reform' for the first time. By explicitly admitting that partial measures could not bring about desired results, Gorbachev firmly identified himself as a reformer and proposed a variety of measures which included a new procurement system in agriculture which would allow farms to sell not only a significant portion (30 per cent) of their basic output of fruits and vegetables but also all above-plan output on the market at whatever prices they could get, reducing planning controls over consumer goods enterprises by allowing them to formulate their own plans based on contracts with trade outlets with a view to make these plants dependent on consumer demand rather than central planning, and switching over to wholesale trade through which plants could buy and sell goods among themselves through contract rather than through central allocation by Gossnab, the state committee for material-technical supply. Most of these proposals were subsequently translated into decrees in the months following the congress, and despite the fact that Gorbachev's position on the expansion of the private sector, market forces and the acceptance of supply and demand as the guiding lever of the economy continued to remain ambiguous, the idea that only radical reform could steer the country out of its difficulties had from all accounts come to stay.

While the notion of radical reform as a possible solution to the country's economic difficulties began to gain ground, Gorbachev's own definition of radical reform still remained unclear. In other words, what remained unclear was whether Gorbachev's endorsement of radical reform actually implied radical solutions. It was in early 1987 when Gorbachev shifted his emphasis from economic to political reform that provided striking evidence of the new general secretary's commitment to a course of reform which went deep enough to hurt and threaten a wide variety of party and government officials. Gorbachev's declaration at the January plenum that perestroika is possible "only through democracy" and that "this is why further democratisation of Soviet society is becoming the party's urgent tasks" heralded a refreshing departure from traditional solutions which perhaps explains why it was received with considerable surprise by observers focusing their attention on recent Soviet history.

Ownership and Economic Reform: Soviet Debate

It is useful to distinguish between these two phases of the Gorbachev reform if only because they help to show that a process of reform can never be a smooth uninterrupted programme of socio-economic change moving along some kind of pre-determined trajectory. On the contrary, the process is often clumsy, contradictory and inconsistent, as a result of which either the original blueprint itself may have to be subjected to further

amendments and modifications or it might in some cases even lead to redefinition of the reform objectives themselves, especially when problems that were not necessarily anticipated by the reformers arise in the process of implementation. In yet other cases, this could equally result in abandoning the entire attempt altogether which is essentially what happened to earlier reform attempts in most of the socialist economies of eastern Europe in the late sixties and early seventies. The Gorbachev attempt is no exception to this rule: in the past three years, there has been a remarkable shift in the nature of Soviet and east European discourse, of which perhaps the present debate on restructuring state ownership could prove to be most significant.

While the Soviet debate on ownership and economic reform has not succeeded in breaking new ground in the socialist world, its significance lies in the fact that such liberal thinking stands in sharp contrast to the official silence which similar discussions in Hungary and China were met with earlier. Decentralising the state sector with a view to making it more competitive and efficient has not only been a recurrent objective of east European reform initiatives in the past, but it has also proved to be an objective which has invariably proved to be inherently difficult to realise. In the Hungarian and Chinese cases, this led reformers to contemplate changes in the system of ownership, the essential idea behind which was the conviction that genuine reform required fundamental changes in resource ownership as well.[5]

The problem is a crucial one and may be schematically defined as follows: under conditions of state ownership, how can producers be motivated to behave competitively and be induced to economise on resources, explore new markets and develop new products as dynamically as they would under capitalism? Even in Hungary and China, two countries which have gone further than the Soviet Union in reforming their economies, reform successes have been generally restricted to or have stemmed from an expansion of legitimate private and co-operative activity. On the other hand, efforts to streamline the state sector have in greater or lesser measure failed to achieve their objectives. Despite the fact that state enterprises in Hungary do not receive output targets or supply allocations, they nevertheless pay more attention to the central authorities than to their customers or suppliers. This is because they do not face a threat to their survival if they fail to control costs and produce competitive products.

The Hungarian experience therefore suggests that as long as state bodies retain ownership in business ventures and have a stake in their survival, it is almost impossible to prevent them from interfering in their management. This is a problem which Hungarian planners appear to be aware of since the notion of separating the state as owner and the state as regulator by creating state holding companies undoubtedly stems from a desire to reduce managerial dependence on central or ministerial authorities. But there is more: even if state or co-operative enterprises are allowed to retain substantial funds to invest in expansion activities, this still does not help the flow of investment funds between different activities because state enterprises in Hungary still cannot embark upon a line of production by creating a new company (not without considerable difficulty at any rate) or invest in other firms that offer a higher rate of return instead of ploughing profits back to the enterprise. This explains why reformers in Hungary and China not only argue in favour of a further reduction in state regulation, but also advocate the need for the creation of some kind of capital market allowing the issue of bonds and equity shares which would however be confined to workers belonging to firms issuing them.

While the Soviet debate on these questions has not progressed to the extent that it has in countries as Poland, Hungary and China, Soviet economists are coming to increasingly acknowledge the need to accord an important role to individual and co-operative forms of enterprise in the articulation of an effective economic system.[6] It is perhaps not surprising that the Institute of the Economics of the World Socialist System of the USSR Academy of Sciences (IEMSS) headed by academician Oleg Bogomolov, should be primarily responsible for bringing questions of personal motivation and ownership and control of assets within the ambit of public debate. Founded for the study of the experiences of the socialist countries, the IEMSS has had an impressive range of reform-minded specialists as Evgeny Ambartsumov, Antoly Butenko, Gennady Lisichkin and Gely Shmelev.

In an article published in *Kommunist*, the party's theoretical journal, Bogomolov himself argued in favour of developing new forms of capital ownership alongside state ownership.[7] These included individual, family and small-group ownership as well as mixed forms of ownership as state-cooperative, state-industrial and state-capitalist. According to Bogomolov, introducing these innovations would strengthen the links between those who control the use of assets and the incomes of those who do the controlling.[8] Despite the fact that resistance to such revisionist ideas is clearly very great, the significance of the Soviet debate lies in the fact that Soviet economists, planners and ideologues have not only made a start, but also that recent legislation on ownership (as the draft law on co-operatives) bears the imprint of radical ideas which would clearly have been impossible in the absence of such ideas having been absorbed by policy-makers in the higher echelons.

It must however be said—by way of conclusion—that most reform-minded economists and ideologues have yet to convincingly confront the question whether in view of these developments the Soviet economy can still be considered 'socialist'. To some observers, the reformers are paving the way for a mixed economy, while to still others the reforms are imperceptibly leading the socialist countries back to capitalism. Whatever be the outcome, it is useful to remember the gap separating development goals such as those that are officially proclaimed and the actual course of economic development: the future evolution of the Soviet economy may or may not correspond to the expectations of those intent on transforming it. In a similar vein, the eventual outcome moreover may or may not be better than the system that preceded it. Some elements of the projected system might prove to be the most rational and desirable; on the other hand, some may not. These are indeed open questions. What is refreshing amidst these uncertainties is the public discussion of potentially conflicting alternatives, the return to the precedents set in the twenties and the fact that such questions have gradually come to be incorporated into the mainstream of Soviet economic discourse.

Sexual Division of Labour

DN and GK

The division of labour between genders, far from being natural, is ordered by society, and once established acquires the force of law. It is thus forced and not voluntary.

THE division of labour between men and women seems to be the most 'natural' aspect of human society, something that is virtually beyond question, seemingly based on the actually natural (biological) division of labour in procreation. This division of labour, however, is so 'natural' only because it is such an old, pre-historical aspect of human society. But other than the biological division of labour, whereby women alone can bear children and nurse them, there is no other actually natural division of labour in human society. Going further, it can even be said that, since it is precisely labour (the conscious transformation of nature) that distinguishes human society from the rest of the animal kingdom, there is nothing natural in *any* order or division of labour in human society.

The natural reproductive role of childbearing and nursing was at one time thought to be the factor that constrained the 'economic' activities of women, being translated, for instance, into restriction to such activities as gathering, rather than hunting. In one way or another, it is the supposed social construction of the biological fact of a capacity to bear and nurse children that, according to this analysis, is the base of the division of labour. See for example the analyses by Michelle Rosaldo (1974) and Nancy Chodorow (1974). "There is a strikingly uniform division of labour in hunting-gathering societies. The women gather; the men hunt" (G P Murdock, 1968, 335). But even in this division of labour, which itself is not so uniform, neither the effort, skill nor the distance covered in gathering are anything less than that regularly involved in hunting (Coontz and Henderson, 1986, 21). Further, hunting of small game by women is a regular feature of foraging tribes, including the Birhor of Jharkhand (Jyoti Sen, 1966). The ritual 'jani shikar' (women's hunt) of the Oraon, Munda, Santal and Ho suggests an earlier period when women of these tribes may have regularly participated in hunting, a participation that subsequently became ritual as weapons came under male monopoly.

Recent evidence on the Agta of the Philippines has challenged the 'incompatibility of female reproductive roles with hunting' (Mukhopadhyay and Higgins, 1988, 476). In the study as summarised in this review, it is pointed out,

> There most women in every age group including pregnant, menstruating and lactating women, hunt regularly. Men and women take hunting trips of similar distance and duration; kill the same range of animals, including large animals; and work in mixed-sex as well as same-sex teams. Although pregnant women and women with children under six months reduce their hunting somewhat, the peak years of female hunting activity coincide with their prime childbearing years. Women themselves say hunting is no more incompatible with childcare than other subsistence activities; nor, they say, is carrying babies on hunting trips a handicap.

Even the exclusion of women from "the individualistic hunting of large mammals seems to be closely related to the making and using of hunting weapons and associated with economic and/or religious ideas" (Watanabe, 1968, 74). Further, for the Agta, "Among women who do not hunt, lack of hunting dogs rather than incompatibility with childcare is the most frequently cited explanation" (Mukhopadhyay and Higgins, 1988, 476). Whether it is hunting weapons or hunting dogs, it is the economic factor of lack of access to such resources that affects participation in hunting rather than any natural limitation. As pointed out, "There is now no evidence of any absolute constraints that prevent women—regardless or their reproductive state—from performing any activity performed by men. If none can be observed, then 'constraints' should be recognised as preferences. . ." (Mukhopadhyay and Higgins, 1988, 476).

The division of labour between the sexes, even in the early stage of foraging, is then anything but natural, nor even any extension of the natural. Irrespective of whether the division of labour was initially consciously decided upon, or was stumbled upon accidentally, once established as a social norm, the division of labour acquires the force of a law. The division of labour is then not voluntary but is forced. In the manner that it is not voluntary, the division of labour acquires the status of a 'natural' force.

What is the meaning of the division of labour in terms of the relations between those performing the (two) different spheres of activity? Since these are two parts of what is a whole, social labour, the two genders must, along with the division of labour, simultaneously establish a relation with each other, i e, a relation of production and its concomitant, one of consumption. As Marx and Engels pointed out in *The German Ideology*, "...the *division of labour* implies the possibility, nay the fact, that intellectual and material activity, that enjoyment and labour, production and consumption, devolve on different individuals, ..." (1976, 45).

The social division of labour, or, to put it in other words, the formation of the two genders of men and women, is then not a neutral matter. It is a social and not a merely technical division of labour. Further, the division of labour between the sexes is not merely a family matter. Established within the family it exists in the extra-familial, social sphere too. The exclusion of women from the political or social sphere, as, for instance, observed among the Jharkhand tribes is a feature of the social division of labour into the 'public' and 'private' domains (Rosaldo and Ortner, 1974).

What is this social order, this relation of production? It is but another term for property. Involved in this relation of production are both the control and disposition of labour power and also the distribution of the products of labour. It is for this reason that the division of labour in the family is referred to (in *The German Ideology*) as the first form of property.

> This latent slavery in the family, though still very crude, is the first form of property, but even at this stage it corresponds perfectly to the definition of modern economists, who call it the power of disposing of the labour-power of others. Division of labour and private property are, after all, identical expressions: in the one the same thing is affirmed with reference to activity as is affirmed in the other with reference to the product of the activity (1976, 46).

A division of labour, including the primordial division of labour that created the two genders of men and women, is, then, a form of property. In fact, it is the form of property. Or, to put it another way: the family, as the social institution within which the division of labour between the genders is expressed, is itself a form of property. This point, expressed so forcefully in *The German Ideology*, has been reiterated by some feminists. Christine Delphy, for instance, points out, "They [women] are neither selling what they produce for money, nor their labour for a wage. Their labour power is being given in return for maintenance" (1984, 38). And again, "Consequently, as soon as a 'lot' is attributed to women, blacks or proletarians (the 'lot' consisting not of tasks but of jobs and thus relations of production) *the hierarchy (the valuation* in Leclerc's terms) is set up. It is not established after, nor independently, but in and by the very process of attributing 'lots'; by the social, not technical division of labour" (207).

That a division of labour is not something neutral but inevitably connected with particular relations of production, can be seen in the role of certain taboos or prohibitions. For instance, in all the agriculturist (cum-forager) tribes of Jharkhand there are universal taboos against women ploughing, or even touching the plough, and against women roofing the hut. The very strong taboos against such activities are themselves understandable only if such activities had

in fact been carried out by women in an earlier period. Prohibitions, enforced with dire sanctions, were necessary to enforce a new division of labour. Since some manner of force (perhaps only a ritual force) had to be employed to establish the new division of labour, this could only have been possible if those enforcing the new division of labour already had force at their command, i e, already had a hierarchically higher position. Thus, hierarchy did not follow. Rather, the hierarchy was the pre-condition for, or at least, the necessary concomitant of the new division of labour. Of course, once established, the new division of labour has additional consequences in strengthening the hierarchy. But, it must be emphasised, the hierarchy is not established by, or not the result of the division of labour. Rather, the hierarchy and the division of labour go together. They are two parts of a whole, of a relation of production, or, in an equivalent expression, of a form of property.

If hierarchy and the division of labour are not simultaneous, then, if anything, it is hierarchy that precedes the division of labour. Both together are the consequence of a form of property, but it may be that prior seizure of political power was necessary in order to establish fully a particular form of property. This point was made in a slightly different fashion in a study of 'Band Societies', where it was pointed out by Annette Hamilton (1982, 92) "it is in the realm of the 'religious' that the first hints of truly 'economic differentiation' are to be found". This is no contradiction of the materialist position; what it does mean is that changes in ritual status (i e, power) may anticipate changes in production relations.

The strong prohibition against women ploughing must be seen in the context of the known importance of women in hoe agriculture, where the main instrument (the digging stick that became the hoe) was generally employed by women. Further, in the agriculture prevailing in Jharkhand women play the major role in all agricultural operations, other than ploughing. Overall, their contribution to even field labour itself is more than that of men. The social prohibition on women ploughing is (crucial) to establishing (justifying) men's right to the land. The prohibition is a way of establishing a division of labour, which implies both a (political) hierarchy and a form of property.

The prohibition of roofing, again, is a way of emphasising men's superiority in the home and women's dependence on them for a home. Is there any such or similar prohibition among the forager (hunter-gatherer) Birhors and hill Korwas? Both make houses of leaves and sticks arranged into a conical, tent structure. Birhor men and women together participate in all activities, including hunting (which, at least now is restricted to small game). There are no reports of any prohibitions like that on women doing the roofing, and with their minimal division of labour and in the absence of any property relation to land, it is highly unlikely that there would in fact be strong prohibitions of this kind.

As against the above analysis of the division of labour, following from the approach in *The German Ideology*, Engels in *The Origin of the Family, Private Property and the State* holds that in the phase of society preceding the establishment of private property, "They [men and women] are each master in their own sphere: the man in the forest, the woman in the house" (1972, 218). The 'world historic defeat of the female sex' is identified with the change from the earlier position, in that "The man took command in the home also;..." (120).

The same point is repeated by Eleanor Leacock who, studying foraging band societies, finds a clear-cut division of labour operating, but holds that women and men were 'separate but equal' (1981, 136). According to her, "...women were autonomous in egalitarian society—that is, they held decision-making power over their own lives and activities to the same extent that men did over theirs..."(134). Maria Mies goes further in holding that "Such a division [of labour between men and women] is a necessary consequence of all human interaction with nature" (1988, 69). So the question is not "When did a division of labour arise between men and women?" but rather "How did this division of labour become a relationship of dominance and exploitation; and why did this relationship become asymmetric and hierarchical?" (69). Leacock finds inequality or hierarchy arising from the shift in the nature of production—the shift from production for use, to production for exchange introduced by colonialism. For Mies the asymmetric division of labour arises from the 'qualitatively different bodies' with which men and women act upon nature as a result of which 'women and men appropriate nature differently' (1988, 73). (A new twist to Freud's "Anatomy is destiny"?).

Even, however, in a situation where each is 'master'(!) of an own sphere, there will still be domination of one gender over the other and control of labour power. One of the spheres, the so-called public sphere of men, of war (politics) and the forest dominates the other sphere, the so-called domestic sphere of women. Such a division of labour, therefore, does not preclude a relation of dominance. On the contrary, as it is pointed out in *The German Ideology*, with a division of labour there will inevitably be an *'unequal* distribution of labour and its products' (46). Such a relation of production necessarily accompanies even this 'primitive division of labour' between the sexes.

At the same time, the existence of some degree of autonomy within the dominated sphere, does give a certain measure of dignity to the woman. This dignity is completely lost when the man takes 'command in the home also'. This taking 'command in the home also' is the final point in the 'world historic defeat of the female sex', the defeat which fully enslaved women and established patriarchy, but it is not its starting point. The starting point of this world historic defeat of the female sex is the establishment of the division of labour that created the two genders, men and women.

REVIEW OF INDUSTRY AND MANAGEMENT

Real Wages and Productivity in Industry

A Disaggregated Analysis

Bagaram Tulpule
R C Datta

This paper examines the behaviour of real wages, productivity and the share of wages in the value of output and value added in industries such as the sugar, cotton textile, paper and paper products, petroleum refining, cement, leather, iron and steel and coal mining over the period 1967-84.

IN an earlier paper [*EPW*, October 29, 1988] we tried to examine the behaviour of real wages, productivity, and the share of wages in the value of output and value added by manufacture (VAM) in the factory sector of Indian industry over the period 1961 to 1983. We also compared the real wage series with the series of per capita national income at constant prices over the same period. In the present paper we try to make a similar examination of real wages and productivity for some major industries and explore some other aspects. The industries we have taken for study are (i) sugar, (ii) cotton textile, (iii) paper and paper products, (iv) petroleum refining, (v) cement, (vi) leather, (vii) iron and steel and (viii) coal mining. The data are taken from several sources such as the various issues of *Annual Survey of Industries* (ASI), *Monthly Abstract of Statistics* (MAS), *Hand-Book of Labour Statistics* and so on. The period covered is 1967 to 1984 except for coal mining for which data for a much longer time series, 1960 to 1985 was readily available.

No particular merit is claimed for this selection of industries from the factory sector. The general idea was to include the larger and more important industries and also some small ones, and that the output of each of the selected industries should be more or less homogeneous. These seven industries account for a sizeable proportion of the total factory sector: 26 per cent of the invested capital, 20 per cent of the employment, 23.7 per cent of the total emoluments of the employees, 26 per cent of the value of output and 20 per cent of the VAM, all in 1984. Clearly, but unintentionally, the group is somewhat biased towards higher emoluments since it accounts for 20 per cent of the total employment but 23.7 per cent of the total emoluments of the employees.

There is, perhaps, another unintentional bias in this group of industries. With exception of leather, these industries are subject to considerable administrative and policy interventions of government including in matters of pricing, distribution, wage bargaining, management, etc. Such government intervention may have affected the different variables studied here although it is difficult to say how far and in what way without further research.

The data collected are given in Table 1. For coal mining all the data are set out in Table 2. From these data, real wages and their indices are calculated and shown in Table 3. Table 4 gives the ratios of wages to value of output and VAM at current prices. Table 5 shows the 3-year averages of the various parameters at the start and end of the series and the rise or fall therein. Since sugar is a seasonal industry, the total output and wages earned by workers depend upon the length of the crushing season as well as upon the wage rate. The crushing season varies in length considerably from year to year. Hence, for calculating the money wages, total wages earned are divided by the worker-days worked and not by the number of workers. The daily wages thus derived are then converted to real wages and index of real wage derived therefrom.

Admittedly, there are several gaps in the data we could collect. Besides, at some places, the figures given in the ASI do not appear to correct. In spite of these gaps and possible inaccuracies in the figures, we have tried to interpret the data and derive some conclusions from them.

Real Wages

It will be seen from Tables 2 and 3 that in all the industries studied, the overall trend is of rising money and real wages. While in coal mining real wages have risen almost continuously between 1960 and 1985, those for most of the other industries studied show considerable ups and downs during the much shorter period of 1967-84. Moreover there is also a broad pattern in these ups and downs. After real wages rose moderately from 1967 to 1973, there was a small set-back for a couple of years or so before the rise resumed to reach a peak around the year 1979. Again from 1980 onwards, there was a distinct fall in real wages for about 3 or 4 years before they recovered in 1984 to the level, more or less, of 1979.

The real wage series for petroleum refining shows an inexplicably sharp drop during the period 1980 to 83. This may perhaps be the result of some errors in the ASI figures.

Excluding sugar which is a seasonal industry and annual earnings in which are not comparable to those in other industries, leather and tanneries shows the lowest real wages in the group of industries studied while petroleum refining shows the highest. Cement and iron and steel also show relatively high figures of real wages.

The average annual real wage for all industries in the factory sector in 1967 was Rs 1,215. In the present group the real wages in paper and paper products and leather and tanneries were below the all-industries average in 1967. These two industries also stood below the all-industries average in the year 1984.

Table 3 also shows that the extent of increase in real wages in different industries is far from uniform. Taking 3-year averages at the start and end of the series, it is seen that the total rise in real wages for all industries is about 51.5 per cent over the period 1967-69 to 1982-84. Real wages in coal mining have risen by as much as 88.8 per cent during the same period. Iron and steel also shows a large rise of 71.3 per cent. The rise in sugar and cement is just about equal to the all industries average while in cotton textile, paper and leather, the increase is much lower than the all industries average. Ignoring petroleum refining for which the correctness of the figures for the last several years is suspect, the lowest increase in real wages is registered by leather and tanneries.

This picture of real wages and relative increases in them suggests that the two factors (1) importance of an industry in the national economy and (2) bargaining power of workers in the industry, are the most important determinants of real wages and, more importantly, of the rate of increase of real wages. In coal mining and iron and steel, both these factors have been conspicuously at work with the result that real wages in these two industries have registered most rapid increase. Indeed, in coal mining, the increase must be viewed as remarkable, for, while in 1960, real wages of coal miners were some 5 per cent lower than the factory sector average, in 1984, they stood over 45 per cent above that average. At the other end, leather does not stand high on either of the above mentioned counts and hence,

workers in that industry made a meagre gain of 23 per cent in real wages over a period of 15 years. The organised textile industry has also yielded primacy in production to the decentralised sector and hence, in spite of relatively good organisational strength, textile workers have not fared well in the matter of gains in real wages.

The effect of technology on wages also is noticeable. Relatively high technology industries like petroleum refining, iron and steel and cement are able to pay relatively high wages to workers. One exception to this seems to be coal mining where the wages since 1980 have been high and risen rapidly although it cannot be considered a high technology industry.

Wages and Productivity in Coal Mining

Coking coal was nationalised in the year 1971 and rest of coal mining in 1972. The immediate impact of this on both labour productivity and real earnings, it will be noted from Table 2, was adverse. It is possible that the very nature and expanse of the coal mining industry was such that the termination of private ownership of mines caused some dislocations and tensions and the new public sector organisations that took over from the private owners took some time to gain real control over operations. In any case, the immediate post-nationalisation years saw a fall both in labour productivity and real earnings.

It will be noted that while during the 12 years 1961-72, the total output of coal rose from 56.1 to 75.7 million tonnes, i e, by about 40 per cent, during the 13 post-nationalisation years 1973 to 85, the rise was from 77.1 to 149.9 MT, i e, about 94 per cent. Similarly, in the 12 pre-nationalisation years coal output per employee-year went up by about 36 to 38 per cent. After a brief set, back on nationalisation, output per employee-year returned approximately to that level in 1975 and in the subsequent 11 years of nationalised working up to 1985, the output per worker-year went up by over 48 per cent.

Over the entire period 1961-85, output of coal per worker-year has, far from remaining stagnant, doubled, and much of this increase has come after nationalisation of the industry was consolidated.

The benefit that workers derived from nationalisation is even more notable. During the 12 years, 1961-72, real wages rose by a mere 28 per cent. After a couple of years' set-back, the index of real wages (1960=100) rose from 112.2 in 1974 to 267.5 in 1985, a rise of 155.2 points or about 138 per cent. Even allowing for the fact that coal miners wages were very low in 1960 and even in 1974, the gains in real wages secured by them after 1974 are, indeed, remarkable and not matched, perhaps, by workers in any other industry. These gains have also far outstripped the gains in labour productivity.

Labour Productivity and Share of Wages

For the factory sector as a whole, the share of wages in value of output and value added by manufacture (VAM) has been falling steadily over the years (Table 4). For the group of industries studied here, however, we get a mixed picture. In sugar and cotton textiles the share of wages in both output and VAM has increased over this period. In paper and petroleum refining, although wages as a proportion of the value of output has fallen, its share in VAM has risen. In leather, cement and iron and steel, the share of wages in both output value and VAM has fallen.

A similar mixed picture appears in respect of labour productivity measured in terms of VAM per worker at constant (1970) prices and where figures were available, physical production per worker. (For sugar, for reasons explained earlier, both VAM and production are taken per worker-day.) VAM per worker at constant prices shows a fall for paper and petroleum refining, although for the former, physical production per worker

Table 5B

has risen slightly. For the other five industries in the factory sector, VAM per worker at 1970 prices has risen although in cotton textiles and iron and steel physical production per workers has fallen, only marginally so in the latter.

The relation between VAM per worker at constant prices and real wages, again, fails to show any consistent pattern. By and large, real wages in these industries seem to have risen more than VAM per worker except in sugar where the rise in both is more or less the same and in leather and tanneries, in which increase in real wages has lagged far behind the increase in VAM per worker.

Why the behaviour of these variables should be so erratic is difficult to understand. Presumably, at the level of individual industries, a number of parameters such as capacity utilisation, relative movement of prices of inputs and outputs, the rate of wage increase, the effects of administered prices, volume of employment and so on, play a part in determining the share of wages in output value and VAM, labour productivity in value and physical terms and its relation to real wages. Aggregated for all industries in the factory sector, the effect of fluctuations in these parameters possibly get cancelled out and we obtain consistent time series.

CONCLUSION

For the group of industries studied here, it is found that both money and real wages are highest in petroleum refining and iron and steel, and lowest for leather. This is possibly the result of the higher capital intensity of the former two and the low capital intensity of leather. The invested capital to VAM ratio in 1984 was 9.89 for petroleum refining, 7.41 for iron and steel and 2.99 for leather. The other contributory factors would be the organised strength of workers and the importance of the industry in the country's economy.

For the industries covered here, the rise in both money and real wages over the period covered is far from uniform. The highest rise is recorded in coal mining and iron and steel and the smallest in leather (ignoring that in petroleum refining for reason indicated earlier). Here again the gains made by workers appear to be influenced by the importance of the industries in the national economy and the organised strength of workers.

In all these industries excepting leather the rise in real wages is higher than the rise in real per capita national income in the same period, very considerably higher in coal mining and iron and steel.

In all these industries, again excluding leather, the rise in real wages, during the period covered, has been higher than labour productivity measured as VAM per worker at constant prices, although only marginally so for sugar. In all but two industries, share of wages in value of output has fallen but share of wages in VAM has risen in as many as four of the seven factory industries during the period covered. These factors would have important implications in the context of wage policy and prices which will need further research.

Technical Change and Competitiveness in Indian Textile Industry

Sushil Khanna

Why is it that the pace of technical change in Indian industry has been so poor? What are the forces that determine the pace of this change? Since Indian research and development efforts have been meagre, why is it that industry has not imported more advanced techniques from the advanced capitalist economies? What has been the role of Indian capital goods sector in this process? This paper seeks to examine these issues in the context of the cotton textile industry.

THE last a few years have witnessed an uneasiness with the industrialisation strategy hitherto followed amongst Indian planners and policy makers. It is argued that the old strategy has focused almost exclusively on the home market and has ignored technological changes in the other parts of the globe, mainly the advanced capitalist economies. "The protection from international competition of the earlier semi-insular phase has given rise to high cost manufacturing, which is inhibiting both the expansion of the domestic market and more rapid development of exports" [India, 1985:16].

Hence 'modernisation' has become a central objective of the new strategy of liberalisation of the economy. The search is on for 'appropriate stimuli' that would prompt Indian industry to adopt 'radical restructuring', re-equip and retool as well as fan out into new areas of 'sunrise' industries [India, 1985].

The search for 'appropriate stimuli' has prompted our planners to gradually dismantle the entire structure of licensing and controls and slowly open up the economy to international competition. This has meant a more liberal import regime with lower and declining tariffs and a renewed invitation to international monopoly capital to come and invest in India. It is argued that the bulk of new technologies and innovation are generated within the research and development laboratories of transnational corporations (TNCs) and if Indian industry is to be modernised there is no option but to allow greater inflow of capital and technology from abroad. No distinction is made between intra-TNC technology transfers and those between TNCs and independent Indian firms. The influence of the import lobby is obvious from the fact that the government seriously considered putting imports of technology under OGL (Open General Licence)!

As far as traditional and older industries like cotton jute textiles are concerned the crisis in them is attributed to technological obsolescence. Government policies in these sectors, it is argued, have been biased against fresh investments; and import restrictions on capital goods and advanced technology have condemned entire industries to obsolete technologies. Such high levels of protection have made our industries oblivious to rapid technical change, made them internationally uncompetitive and 'high cost' producers. In the cotton textiles sector, where sickness has become endemic, the relative success of a few 'modern' firms like Reliance and Bombay Dyeing is used to reinforce the argument that the rest of the industry should be prodded to 'modernise'.

Such a viewpoint has in recent years brought forth a new 'liberalised' policy regime with regard to the older industries, which it is argued will correct the earlier bias towards outdated technology. Imports of technology and capital goods have been liberalised and import duties dramatically reduced. The public sector financial institutions have been asked to fund special modernisation programmes at subsidised rates of interest and reduction of workforce accepted as a necessary evil.

The question that needs to be asked is: why is it that the pace of technical change in Indian industry is so poor? What are the forces that determine the pace of this change? Since Indian research and development efforts have been so meagre, why is it that the industry has not imported more advanced techniques from the advanced capitalist economies? What is the role of Indian capital goods sector in this process?

It is our hypothesis that there are good economic and structural reasons why several industries like textiles have not modernised. Firstly, the very direction of technical change in advanced capitalist countries has been shaped by the specific characteristics of these economies. Secondly, the very process of production of new technologies—in the R and D laboratories of transnational oligopolies—has been shaped by the corporate strategies of the TNCs to enhance their market power. Lastly, it is (paradoxically) the very success of some industries in successfully absorbing early generation of foreign technology and becoming efficient and competitive producers of capital goods and technical services that has acted as a barrier towards shift to more advanced techniques. And all this has hardly been a disaster, as our policy makers seem to think.

In this brief paper, we intend to examine the cotton textile industry in India. In this, we intend to move away from the production function type of analysis and use technical and engineering information to understand the direction of new techniques of production and the factors underlying these (Section I). This is crucial to our appreciation of the 'appropriateness' of technical innovations generated by the international textile industry during the last three decades to Indian conditions. In Section II we discuss the structure of Indian textile industry and its international competitiveness. Section III examines the Indian textile machinery sector, whose technology and skill levels as well as technology absorption capacity have influenced the pace of technical change in the cotton textile industry within the country. The international competitiveness of this sector and its consequences for modernisation of the Indian textile industry are discussed. The consequences of these structural and economic factors for technical change in the Indian textile industry are discussed in the next section (Section IV). The case of textile industry has important lessons for technology and industrial policies in third world countries (Section V).

I

Technical Change in International Textile Industry

The last three decades have seen a very rapid change in the technology for production of yarn and fabric construction. The very structure of the textile industry and the technology have been influenced by changes taking place in other industries, especially the petrochemical industry and micro electronics. These have influenced the pace and direction of this change. The major innovations have been concentrated in the advanced capitalist economies of western Europe, North America and Japan, though some firms from the socialist countries too have played an important role.

Since the bulk of these innovations are concentrated in a small group of transnational oligopolistic combines, it is essential to identify the main actors in this synthesis of technical innovation and capitalist accumulation. These comprise the two groups of oligopolies controlling the man-made fibre (mmf) industry and the textile machinery manufacturers. Of course, the background is the crisis that gripped the post-war textile industry in Europe and North America.

In 1950, 81 per cent of the world's spindles and 66 per cent of loomage was concentrated in western Europe and the US, with a significant share of the world exports [Thigpen, 1978:19]. With the expansion of the textile

industry in the third world, the export market was rapidly lost and the industry in advanced capitalist countries found its competitive position eroded due to rising wage costs. There was added problem of third world cotton producers being unable to provide adequate supplies to meet the post-war surge in demand. In response to these factors, the industry in the advanced capitalist countries began to scrap spindleage and looms; and by mid-sixties the share of west Europe and the US had fallen to 40 per cent of world spindleage and merely 26 per cent of looms [Thigpen, 1978:20]

The second response was to introduce innovations that would reduce workforce and raise productivity. The methods used in the cotton textile segment were to reduce the number of processing stages, to run machines faster and to produce larger packages in the spinning sector, and to introduce automatic looms in the weaving sector. However, the impact of these changes was marginal on productivity and employment. The output per spindle hour improved marginally from 0.023 lbs to 0.026 lbs during the 1950s and auto doffing in weaving sheds brought some reduction in workforce [UNCTAD, 1981:239].

More significant innovations in the international textile industry are to be attributed to the introduction of synthetic fibres made from petroleum feedstock. A highly oligopolistic petrochemical industry led by Du Pont in the US, ICI in UK and the Farben sisters (BASF-Bayer-Hoechst) in Germany, along with other major actors like Monte Catini, Akozo and Courtaulds evolved aggressive corporate strategies to penetrate the textile industry. Backed by their vast market power and large amounts spent on 'application research', this helped to tilt the inter-fibre competition in favour of synthetics. Their earlier efforts were to produce filament yarn that would replace the cotton yarn in the weaving and knitting sectors. Though nylon easily replaced silk in women's stocking, the penetration into other segments was poor because of the fibre quality, low consumer acceptance and difficulty of dyeing synthetic fabrics. Soon texturising of synthetic yarn helped overcome these difficulties. The technology to produce textured synthetic filament imparts qualities like bulk, greater aesthetic value and superior weaving properties usually associated with yarn spun of staple fibres. This process completely eliminates the spinning stage and made possible the use of synthetic fibres in large variety of textile products [UN, 1965:164]. The other major innovation was the conversion of tow. The converter technique makes use of the natural formation of man-made fibres produced by chemical plants to convert the uniform, parallel filament into short length fibres (staples) without disrupting their parallelism and convert it into staple sliver and subsequently yarn of high quality [Press, 1969:265]. Besides being used for production of 100 per cent mmf spun yarn, the tow can be converted to 'top' to be blended with natural fibres. This substantially reduces the cost of fibre to sliver conversion in the spinning mills.

TABLE 1: TECHNICAL CHANGE IN TEXTILE INDUSTRY

Processing Step	Processing Features: Traditional	Processing Features: Modern	Remark
(1) Opening and Cleaning			
(a) Plucking	Manual pluck and feed	Auto belt/coursel feed Mechanical pluck	35 per cent increase/hour. Faster plucking speed can break cotton fibres.
(b) Scutcher	Manual doffing and change of axis	Auto doffing and axis change, larger lap, auto transfer to cards. Better dust collection	Lap weight rises from 20 to 60 lbs. saves labour at feed, lap doffing and transfer. Direct chute feed to cards possible.
(2) Carding	Low speed vibrating combs manual doffing and small cans	High speed rollers, auto doffing and large cans	Up to 400 per cent rise in output, labour and capital saving due to fall in number of cards and space.
(3) Drawing	Slow speed, manual doffing	High speed, auto doffing and larger cans. Auto-leveller needed if chute feed at cards	Larger cans mean fewer stoppages and higher machine efficiency. Output higher by 10-15 per cent.
(4) Roving	Manual doffing	Auto doffing	Output rises by 30 per cent; does not offset higher machine cost. Roving eliminated in open-end spinning.
(5) Spinning			
(a) Ring	Manual doffing and piecing	Auto doffing and piecing	Auto piecing expensive and less in use.
(b) Open-end		Sliver from draw frame broken into constituent fibre in spinning vessel (rotor). Higher rpm and draft factor	Integrates roving and spinning. Can eliminate cone-winding since packages larger.
(6) Cone winding	Manual feed of spindle and cheese, doffing and knotting	Feed, knotting and doffing automated. Little speed change	Eliminated in open-end spinning
(7) Warping	Slower speed and smaller beam size	Higher speed, larger beam and double sided creels.	Double-sided creel allows operative to prepare one side while the other is winding
(8) Pirn winding	Manual feed and doffing	Auto feed and doffing	Eliminated in shuttleless looms and some auto looms.
(9) Weaving			
(a) Shuttle looms	Manual shuttle change and lower yarn tension	Auto shuttle change/doffing unifil attachments can wind pirns at loom	Non auto looms put less tension on yarn and can use low quality yarn. Require skilled operatives and stoppages frequent. Auto loom output higher if yarn quality good.
(b) Shuttleless looms	—	No shuttle. Wider transfer of weft by rapier, air/water jets. 250-600 ppm speeds	Water jets using synthetic fibre can have 800-1200 ppm speeds. Cotton yarn cannot withstand such high speeds.

Source: [Amsalam, 1983] and [Pickett and Robson, 1981].

Yet, technical innovation alone was not sufficient to replace cotton as the major apparel fibre. The other major component of the strategy of the mmf producers was to absorb a substantial segment of the textile industry within their fold. Thus, in UK, ICI and Courtaulds actively promoted mergers and vertical integration in the textile industry. Courtaulds became the largest textile group while ICI acquired 65 per cent stake in Carrington-Viyella. In some cases, noted an EEC report, "Courtaulds co-operated with ICI during 1963-68 in providing funds to support major textile groups" [EEC, 1975]. By 1969, the Monopolies Commission noted, that the two man-made fibre manufacturers controlled more than 39 per cent of the British spinning capacity, 56 per cent of the filament weaving, 65 per cent of warp knitting and 57 per cent of dyeing [UNCTAD, 1973:29-33]. Similarly in France, Rhone-Poulence was linked through the share-holding of Gillet family with Dollfus-Mieg, a leading textile group [Bolton, 1976:21].

Thus the synthetic fibre industry used its market and financial power to 'capture' specific end-uses and create captive markets for their products. Their R and D efforts were aimed not only at elucidating physical and mechanical properties of synthetic fibres, but also towards developing new chemicals, dyes and pigments and to develop special machines to convert the synthetic into attractive consumer products. Du Pont developed a new range of reactive dyes and machines to process synthetic fabrics. The technology for dyes was shared with other members of the oligopoly like ICI with whom Du Pont had cross-licensing agreements, while patents for processing fabrics (involving high temperatures and pressures) were licensed to textile machinery manufacturers [Khanna, 1984:72-98].

The market power of the petrochemical oligopoly ensured that synthetics would penetrate cotton end-uses irrespective of price ratios. All through the first two decades after the second world war, nylon and later polyester whittled away cottons' market share despite the fact that polyester/cotton price ratio was as high as 3.0-4.0 [Thigpen, 1978: 15-16]. Technical innovation, product development and marketing techniques came to play an important role. The imbalance between research and development expenditures on natural and chemical fibres was matched by an equally large gap in advertising outlays which are estimated to be about 1 to 2 per cent of sales. Hoechst, Germany's largest synthetic fibre producer, estimated that about 90 per cent of the consumers were aware of their 'Trevira' brand by 1968 and the marketing strategy shifted to shaping fashion trends through a chain of fashion studios. Advertising was not only aimed at the apparel public but also for providing 'market guidance' to the textile industry [UNCTAD, 1981:154].

The sharp rise in commodity prices after 1974, combined with the fact that North American cotton production is extremely energy intensive, reduced the polyester/cotton ratio below 1.0. By 1976, cotton had lost about 50 per cent of the world market and about two-thirds of the market in OECD countries [Thigpen, 1978:16].

The rise of synthetics also saw the gradual decline of rayon staple (cellulosic). Sharp rise in capital costs, pollution control and shortage of pulp increased rayon production costs substantially and dampened fresh investments in OECD countries. Thus polyester and acrylic became the major apparel fibres by mid-1970s.

The other major group of actors on the scene has been the oligopoly represented by the textile machinery manufacturers. This consists of about 25 transnational corporations who control a major portion of world-wide production of machinery, either directly or through their licensees. Some of these like Sulzer, Ruti, Rieter (all Swiss), Zinser and Schlafhorst (from FRG) Platt-Saco-Lowell (UK/US), SACM (France) and Nissan and Toyoda from Japan are well known names. Their close links with the petrochemical oligopoly are demonstrated by the fact that every major advance in textile engineering technology since the second world war has favoured chemical fibres over natural fibres. In addition, the drive of machinery manufacturers has been to reduce workforce, to increase machine speeds, reduce the number of processing stages and produce larger packages. This continuously raised capital costs and by 1965, OECD was already classifying the textile industry as one of the capital intensive industries [OECD, 1965].

Table 1 presents an overview of some of the major technical innovations in textile technology. These represent the more important advances in raising machine speeds, automation of doffing and transfers between sections, and integration of several processes or pieces of equipment in the same machine. The best example of the latter is the open-end rotor spinning that integrates roving and spinning, eliminates speed frame process and cone winding since it produces larger packages [Cripps, 1973]. Table 1, however, does not present several other significant innovations which are applicable only to synthetic fibres. One example is the growth of a completely new machinery segment, namely, the texturising machines discussed above. Here too the speed of texturising has risen from about 50 metres per minute in 1950 to the current rate of 800 metres per minute. This has been made possible by the integration of separate processes of drawing, twisting, setting, untwisting and final setting of yarn [West, 1979]. These high take-up speeds make higher claims on polymer quality of yarns, illustrating the symbiosis of yarn qualities and machinery design. To be sure, the new type of yarn, i e, Crimplene, could be knitted on double jersey machines, but the double jersey machine itself was in turn made possible by the existence of such new types of yarn. Major advances in knitting are to be attributed entirely to synthetic yarns. The development of nylon yarn resulted in the use of warp knitting machines, while polyester yarn led to better patterning ability on circular knitting machines [Rothwell, 1980]. Between 1972 and 1977 the warp knitting machine speed increased from 1,000 to about 1,700, and Raschel knitting machines from 550 to 1,000 courses per minute [UNCTAD, 1981:243]. These innovations have raised the fabric output per hour on knitting machines to levels substantially higher than those from most modern looms. The latest knitting innovation, the 'Presser Foot', ushers in a qualitative change in the entire textile industry. Developed by Courtaulds through 13 years of research, the machine can produce partially or completely finished garments rather than simply knitted fabrics. The Swiss firm Dubied was the first to produce the Presser Foot under a Courtaulds licence, but now Courtaulds have sold exclusive rights for the machine (in Japan) to Mitsui [UNCTAD, 1981:244]. The links between textile machinery oligopoly and petrochemical transnational corporations have capitulated many textile engineering firms as important suppliers of equipment and technology for man-made fibres. Thus, Zimmer (FRG) is engaged in commercialising technology and supplying equipment for polyester plants while Rieter and Inglostodt are important suppliers of melt spinning plants for nylon and polyester [Boon, 1981:92-96].

The point that needs to be emphasised is that most of the major innovations in textile technology that provide higher spinning and weaving (or knitting) speeds make demands on the textile and mechanical properties of filament or yarn. Petrochemical corporations responded by 'engineering' new fibres with polymer properties to withstand the increase in take-up speeds. An example is the rate of picking in weaving. This used to be 150 picks per minute in the Lancashire loom; now it is 600 picks per minute in water jet looms and recent innovations are aimed at picking rates in excess of 2,000 [West, 1979]. Cotton begins to disintegrate at speeds of 500 picks per minute. Similarly, the use of water jets to project the weft requires hydrophobic (water-repellent) yarn or subsequent drying of woven cloth. Hence, water jet loom are ideally suited for pure nylon or polyester yarn, though through use of hydrophobic sizes cotton yarn can also be used [Ray, 1984].

What has been the impact of these innovations on the economics of textile industry? Firstly, it needs to be noted that modern technology is extremely capital intensive, in the sense capital requirements per unit of output are 8 to 10 times higher than the machines in vogue during the 1950s and 60s (Table 2). This substantially raised capital costs as a proportion of total costs and made it imperative to work the machines on three shifts. Also any downtime due to yarn breakages or other technical faults would make it uneconomic and raise costs. All this demand greater level of efficiency

and integration of all the three stages of cloth production, namely, spinning, weaving and finishing [Schmitz, 1985].

Secondly, the vast range of alternative technologies available makes possible several combinations, though best results are derived only if the 'best-use' practices at each stage are introduced.

Thirdly, the range of labour and capital usages is very wide. The most advanced techniques may sometimes use as little as 7 per cent of the workforce compared to a 'traditional' mill [Amsalem, 1983:45].

And lastly, the more capital intensive techniques have a greater share of their capital requirement in equipment compared to buildings and require greater proportion of their workforce to consist of skilled and supervisory workers compared to earlier techniques [Amsalem, 1983:47].

This rising capital intensity per unit of output implies that the modern technologies will be introduced only if the higher capital costs are offset by the savings in the wages, power and lower wastage of raw material. Sharply rising economy wide productivity and wage rates in the advanced capitalist countries has obviously made it economically worthwhile for textile firms to introduce these new technologies. Also the increasing penetration of chemical fibres has been a major driving force. Besides, with the use of synthetic fibres and yarn, certain technical rigidities are introduced, especially at the fabric processing and printing/dyeing stages, since special chemicals and process have to be necessarily employed. This has made some degree of modernisation imperative.

II

Structure and Competitiveness of Indian Textile Industry

Indian textile industry is the largest in the world in terms of capacity installed. There are 732 spinning mills and 282 composite mills. The installed spindles are a staggering 28.0 million, of which about 20-25 per cent are not worked. The number of composite mills has not changed much since the early 1950s and the total loomage in the mills have remained stagnant at about 210 thousand, about two-thirds of which were actually worked around 1987 [ICMF, 1989:23-26].

The structure of the Indian textile industry has undergone a profound change during the last forty years. Unlike the trends in western economies, the Indian textile industry has become more fragmented with a decline in the degree of integration between the three stages. As is well known, the weaving is largely in the decentralised sector with the mills playing a diminishing role. The restrictions on the expansion of looms in the mills imposed in the 1950s, ostensibly to protect the handlooms, has spawned a vast decentralised powerloom sector which has proved to be the most dynamic and rapidly growing sector of the industry. The government's efforts to control the expansion of powerlooms through restrictions on sale of looms, etc, have been negated by the technical ingenuity of small engineering workshops and powerloom workers and technicians [India, 1974]. Thus, the number of powerlooms has continued to grow through the last two decades. The 'registered' powerlooms jumped from about 2 lakh in late 1971 to more than 6.4 lakh in 1984-85 [IIJ, 1986], while the unofficial estimates put the figure at more than 10 lakh. The decentralised sector produces more than 78 per cent of all cloth produced in the country. Though, there is no firm estimate of the output from the powerloom sector, it is believed that 50-60 per cent of India's cloth output comes from this sector.

Contrary to the general impression, the 1980s saw a rapid expansion in the mill sector. The number of spinning mills jumped from 370 in 1980 to 752 in 1987-88 and the installed spindles increased from 20 million to 28 million. Bulk of this increase was located in the southern states of Tamil Nadu and Karnataka and Andhra Pradesh. Obviously, the expanding powerloom sector needed spun yarn and the new mills were concentrated nearer to the tracts that had recently come under cotton cultivation. There has also been a rapid increase in 'processing houses' for finished fabrics and most of the new capacity is concentrated in and around major powerloom centres like Surat, Ichalkaranji, Coimbatore etc.

There is a general impression that the expansion of the powerloom sector has been possible because of the excise evasion and other 'illegal' transactions. However, studies conducted by ATIRA and other organisations show that despite the fact that the powerlooms pay 10-20 per cent higher prices for yarn, they are the cheapest producers of fabrics. Their cost advantage springs from lower overheads, cheaper fixed assets resulting in lower capital costs and lower wages [Ranganathan et al, 1985: 100-119].

The mill sector presents a mixed picture. There is a strong opinion that the composite mills have been doing badly since their higher wages and overheads far exceed the economic benefits of integration [Anubhai, 1988]. It is true that the condition of many composite mills has worsened during the 1980s, specially since 1984-85. But it is more likely that poor management and shop floor practices have more to do with the differential performance in the mill sector and both spinning and weaving mills seem to be equally affected.

TABLE 2: INDEX OF PRODUCTIVITY AND CAPITAL INTENSITY IN COTTON SPINNING AND WEAVING

	1950	1960	1970	1980
	Spinning			
(1) Output per worker	100	219	371	732
(2) Output per machine	100	147	216	300
(3) Capital labour ratio	100	116	219	316
(4) Capital output ratio	100	254	812	2640
	Weaving			
(5) Output per worker	100	166	307	517
(6) Output per machine	100	119	240	532
(7) Capital labour ratio	100	126	209	330
(8) Capital output ratio	100	209	643	1707

In order to understand the crisis afflicting the textile industry, it is important to focus our attention on the raw material sector as well as the demand structure. Cotton has continued to be the main raw material for the Indian textile industry. With the partition of the country, the industry was robbed of supplies of long staple cotton from west Punjab and was forced to rely on imported cotton to bridge the gap. The indigenous supplies were not only inadequate, but bulk of it consisted of short and medium staple (less than 22 mm), was poorly ginned and had poor spinning characteristics. The government encouraged expansion of area under cotton cultivation which quickly rose from 6-6.5 million hectares to 8 million hectares by 1956. Yet, yields were dismally poor and the country produced less than 5 million bales. All through the 1960s imports accounted for 15-20 per cent of the cotton consumed by the mills in India.

The mid-70s saw a qualitative break in the scenario. Indian agricultural scientists succeeded in producing new long staple cotton varieties suitable to Indian conditions like Suvin, MCU, Varalaxmi, H-4, etc. This also helped to raise the yields to about 195 kg/ha from 120 kg/ha in 1967-71 period. Since 1978-79, India has been completely self-sufficient in cotton. Simultaneously, there has been a marked improvement in the quality of cotton grown; an increasing proportion of output is composed of long and extra long staple cotton with excellent spinning properties. Thus in 1984-85, about 85 per cent of cotton grown in India had a staple length of above 22mm compared to only 20 per cent in early 1950s. Since 1978-79, India has emerged as a marginal exporter of long staple cotton; but this is largely due to the inability of the textile industry to absorb increasing supplies of cotton and significant decline in per capita cotton cloth consumption (ICMF, 1987). It should be borne in mind that despite low yields, India is an internationally competitive producer of raw cotton [Gulati, 1987] and prices of cotton have been a major factor in the competitiveness of Indian textile industry.

Till 1979, almost 70 per cent of all man-made fibres produced in the country and two-thirds of all imports consisted of cellulosic staple and filament. Made from wood pulp and cotton waste and short fibres, these are easily adapted to cotton spinning systems and present little difficulty in post-weaving processing. The penetration of synthetic fibres (polyester, nylon, acrylics, etc) accelerated since the introduction of multi-fibre policy and increasing domestic supplies of synthetics especially polyester staple and filament. Almost the entire filament is woven in the decentralised powerloom sector (due to restrictions on use of filament in weft by mills) with Surat being the most important centre, while a small oligopolistic group of mills specialise in spinning blended yarn and fabrics. This group, consisting of firms like Reliance, Bombay Dyeing, Mafatlals, DCM, etc, have built strong entry barriers through large-scale advertising, exclusive retail outlets and differentiated product promotion strategies [Chandrasekar, 1984].

In recent years domestic synthetic fibre availability has under-expansion of domestic petrochemical industry and the emergence of a powerful combine of synthetic fibre producers has led to official patronage to the industry strategy to penetrate the textile industry. This has been achieved through the introduction of multi-fibre policy, dramatic reduction in the excise duties on synthetic fibres and yarns and an encouragement given to mills to instal machinery to process synthetics in the name of modernisation.

Despite all this, cotton continues to be the main fibre used in the Indian textile industry. Thus, in 1985, only 15.9 per cent of fabrics available for domestic consumption were pure man-made fibre fabrics, while another 10 per cent was accounted for by blends. If one keeps in mind that more than half of all man-made fibres consumed in India are cellulosic, the share of petrochemical based synthetic fibres would be less than 12 per cent [ICMF, 1981:42].

The penetration by synthetics has been significant only in some end-uses, namely, suitings (trouser fabrics), shirting, and sarees. In 1978, 52 per cent of all trouser cloth was made of mmfs and blends in terms of metres and 86 per cent in terms of value [India, 1980]. The penetration by mmfs is not significant in end-uses like dhotis, ladies dress material and long cloth. Though there has been some increase in these proportions in recent years, this would not alter the overall picture. The hopes generated by the large cuts in taxes on synthetics during the last two years have not yet resulted in any significant increase in consumption of blended and mixed fabrics, though at the margin substitution has accelerated. The production of blended yarn by the mill sector has remained stagnant at 200-225 million kgs during the last five years. As a matter of fact, current levels are about 100 million kgs lower than the production of blended yarn in 1977-79 period. There has, however, been a shift from viscose staple fibre to polyester staple in the mill sector. The increase in use of synthetic filament has been more significant, but as discussed above most of this is consumed outside the mill sector. The consumption of polyester filament has doubled from 72 million kgs to 120 million kgs. The decline in consumption of viscose filament has been marginal.

Roots of Crisis

One can argue that during the last decade, Indian textile industry has not faced any major bottlenecks in supply of major inputs. The problems faced lie entirely on the demand side. There have been closures of mills especially in Bombay-Ahmedabad region, crisis in the powerloom and handloom sectors where a large number of artisans have been thrown out of work.

With 28 million spindles and more than a million powerlooms, besides a very large number of handloom, the installed capacity far exceeds the current levels of demand and production. It is possible to argue that the potential output can be 60-100 per cent higher without major additions to capacity. The roots of the crisis lie in the inability of the consumer to spend greater proportions on cloth. The availability of all kinds of fabrics (i e, cotton, blends and pure mmf fabrics) has grown on an average by 2.2 per cent per annum during 1970-1987.[1] In other words, the cloth output/demand has grown at just below the population growth rates. The per capita cloth consumption (all kinds of fabrics) declined from 16.5 metres in 1965 to about 15.55 m in 1970 and to 14.74 m in 1987 [ICMF, 1989]. The cotton cloth consumption declined from 15.2 m per capita in 1965 to 14.74 m in 1987.

The argument that increases in proportion of man-made fibre fabrics implies that cloth consumption has actually gone up since such fabrics last much longer is entirely fallacious. As we saw above, till recently, bulk of mmfs consumed in India consists of viscose (rayon) staple and filament. Though high tenacity rayon fibres are available and used, bulk of those consumed in India consist of poor quality and cheaper staples and filament that are considered to be inferior to cotton; and fabrics woven from such fibres only have about 80 per cent of the life span of similar cotton fabrics. Only, petrochemical-based synthetic fibres (polyester, acrylic) have a longer life span and fabrics blended with such yarns or entirely made from them have a life span that is 2 to 2.5 times longer [Khanna, 1984].

A large number of studies have estimated the relationship between demand for cloth and cotton/total apparel fibres on the one hand and growth of per capita income and/or economic activity indicators like the Index of Industrial Production on the other. In none of these studies do we find a negative correlation between per capita income or any other index of per capita economic well-being (like GNP, per capita GNP, IIP, etc) and cloth consumption. A major World Bank study based on fibre consumption data for 104 countries and using both cross-section and time-series analysis found a strong and positive relationship between income growth and fibre/cloth consumption. The coefficient of elasticity of per capita fibre consumption with respect to average income was found to be 0.5 for developing countries while developed countries had a coefficient of 0.07[2]. The elasticity for cotton cloth/cotton fibre was also positive, the exact coefficient being a function of cotton/synthetic price ratio assumed in the study [Thigpen, 1978]. In other words, India is one of the very few regions in the globe, where despite rising per capita incomes, the per capita cloth consumption has declined. This, probably is due to increase in income inequalities in the economy.

If our hypothesis that worsening income istribution has depressed overall demand or cloth is correct, and this is specially arked in the demand for cheaper cotton oth, an increase in per capita cloth conumption hinges on factors that will stimute demand for cloth through providing reater purchasing power to the poor in ndia. The other possibility, of a reduction n real price of cloth is ruled by the fact that ndia is already one of lowest cost producer nternationally, and cloth consumed by the oor is hardly taxed. The wide difference in ne price of synthetic and cotton fabrics imlies that cotton fabrics will continue to ommand consumer preference because of heir lower cost and because of the kind of abrics consumed by the Indian consumers. t is at this segment of industry any effort o stimulate demand must focus.

This decline in consumption must also be veighed against the fact that the Indian texile industry is one of the lowest cost proucers of cotton cloth in the world. An TMF study on international production osts shows that Indian yarn and fabric prouction costs are lower than most other ountries (Table 3). The main advantages of he Indian mills lies not only in the low wage osts but the fact that the Indian farmer is competitive producer of cotton. It should e kept in mind that the cost comparisons re based on costs in a standard mill equipped with 13,000 Reiter ring spindles and 140 Sulzer type looms. Since only an insignificant proportion of mills use Sulzer type looms (though Reiter type spinning plants are more common), the capital costs are grossly overstated. Also the study assumes an interest rate of 18 per cent pa for India compared to 22.5 per cent for Korea and 7.5 per cent for the US [ITMA, 1987:11]. This explains, how in the ITMF study costs in Korea and the US turn out to be closer to Indian costs.

In reality, Indian textile industry largely depends on indigenously produced machinery of the traditional kind. Due to the use of second hand and locally produced looms used in the decentralised sector, the fabric production costs should be substantially lower than those shown in Table 3. That the quality of the fabrics produced from such equipment may be different from those considered in the ITMF study and may affect fabric exports need not concern us here. As far as the Indian textile industry is concerned, it is the domestic market that determines the health of the industry. The lack of purchasing power and the inability of the consumer to absorb higher priced quality fabrics produced from shuttleless looms has made the market extremely price sensitive. Hence, the ability of the industry to keep capital costs low has been an important factor in competitiveness. Here, the textile machinery manufacturers have played a crucial role and it is they whom we bring into our focus.

III

Indian Textile Machinery Industry

Since capital costs form about 40-55 per cent of textile industry's production costs the world over [ITMF:1987], the international competitiveness of the textile industry depends to a great extent on the costs of fixed assets especially the machinery costs. Given the tight import regime, the Indian textile machinery producers also shaped the choice of technology.

Till the Second Five-Year Plan, the bulk of textile machinery installed was imported. It was during the 1960s that the textile machinery sector made major strides. The share of imports in the total machinery available fell from about 60 per cent in 1961 to less than 9 per cent by 1974 [World Bank, 1975:2]. By 1982-83, imports again rose to about 25 per cent of machinery purchases [ICMF, 1987:93]. This rise is partly due to the inclusion of machinery for synthetic fibres (strictly speaking chemical machinery) in the data and partly due to the higher import content of new generation modern machines now produced in the country since the late 70s. The Indian textile machinery sector also exports about 8-10 per cent of its total output.

Except for two firms (Lakshmi Machine Works and National Machinery Manufacturers) all the firms engaged in textile

machinery production, produce a wide range of industrial machinery. However, different firms tend to concentrate on a narrow product range. Thus Lakshmi concentrates on spinning and pre-spinning machinery, Texmaco/CIMMCO and MMC concentrate on weaving sector while others like Swastik and Maneklal on processing machinery [Desai, 1983].

The bulk of the output of textile machinery is based on designs acquired from leading international firms from Switzerland, Germany and UK during the 1950s and 1960s. Most Indian machinery producers have well absorbed the technology, developed local ancillary suppliers and made minor design changes to suit Indian conditions and raw materials. However, only few had R and D programmes of any consequence.

Given the government's policy which placed restrictions on expansion of powerlooms in the mills or the decentralised sector, the weaving machinery constitutes only 15-20 per cent of the total output. The unauthorised expansion of powerlooms led to the growth of a large number of small-scale powerloom manufacturers who sold their output in semi knocked down condition as accessories. Most of these are Lanchashire type underpick looms, though overpick looms are now becoming popular. About 55-65 per cent of total machinery output was spinning machinery catering to the large number of new spinning mills coming up in Tamil Nadu and other centres.

In the early 1960s, the spate of collaborations had narrowed the gap between Indian and foreign technology [Desai, 1983:158]. The gap began to increase once the textile industry in advanced countries began to switch to synthetic fibres as a major raw material and a flood of imports from centres like Hong Kong and Korea hastened modernisation. Thus by 1975 the technology gap between Indian machinery manufacturers and those in advanced capitalist countries was wider [World Bank, 1975].

But, as mentioned above, leading firms like Laxmi Machine, Star Textile, etc, were able to successfully absorb the technology imported in early 1960 and developed a chain of local suppliers of components and accessories. Amongst the more efficient firms, the product designs are regularly improved and quality is comparable to the best machines of conventional designs. The small R and D programmes were directed at redesigning components to meet Indian conditions, marginally increasing the speed of existing machines and adopting machines for other than their original purpose (e g, cotton ring frame for worsted spinning or doubling) and copying the design of an imported machine with some modification to suit the Indian market or the manufacturer's machine tools. Sometimes, the programmes were aimed at cheapening the machine (e g, CIMMCO's efforts with auto-looms) by removing more sensitive components [World Bank, 1975:19].

A fiercely price sensitive domestic market and fluctuations in demand ensured that the best firms in the industry enjoy enormous cost advantage over international producers. Thus, the World Bank study found that Indian firms sold ring frame for Rs 1.96 lakh compared to Reiter's price of Rs 3.45 lakh and speed frames for Rs 2.4 lakh against comparable machines international price of Rs 5.4 lakh. However, products like combers, which had a high import content (in 1975), were only 10-20 per cent below world prices [World Bank, 1975:28]. All this was achieved with machine shops that used single purpose non-automatic light machine tools.

Table 4 compares cost structure of a leading Indian manufacturer and a Swiss TNC. The Indian firm has significant cost advantage in labour and overhead costs, which together account for half the price differential between Indian manufacturer and the TNC. Indian plants were also less capital intensive, used older generation machine tools and antiquated foundries. This led to lower capital cost (depreciation and interest). In other words, the Indian textile machinery industry has a substantial cost advantage in all factors of production.

These advantages have partly been eroded by higher steel prices in recent years. A study by Pickett and Robson found Indian textile machinery to be 30-50 per cent cheaper during 1980s [Pickett and Robsons, 1981:21].

The diffusion of knowledge to fabricate parts, accessories and even entire pieces of fairly sophisticated machinery has led to a thriving un-organised and small-scale sector that supplies both mills and the unauthorised powerloom sector. The technological ability of this segment to maintain, recondition and produce new machinery largely underlies government's failure to check the expansion of decentralised powerloom sector in places like Bhiwandi and Surat. These producers often are able to supply the equipment and accessories at prices that are a fraction of even the organised sector Indian machinery manufacturers' prices.

The general conclusion that one can draw is that once the Indian capital goods producers successfully absorb the imported technology, the imported components are replaced by local manufacturers and links with local suppliers forged, Indian's vastly cheaper skilled and supervisory manpower provides comparative advantage, making the more efficient firms in the capital goods sector cost competitive by international standards. This is not to deny that the less efficient firms may have higher costs, may be producing goods of poor quality and may find it difficult to maintain market shares.

TABLE 4: COMPARISON BETWEEN INDIAN AND FOREIGN COST STRUCTURE FOR SIMILAR MACHINES

	TNC	Indian	Difference	
			Absolute	Relative
Sale price	100.0	60.0	40.0	40.0
Raw material	40.0	28.0	12.0	30.0
Labour	11.0	2.2	8.8	80.0
Overheads and salaries	18.0	7.3	10.7	55.0
Sale and royalty	7.0	6.0	1.0	12.0
Depreciation	7.0	3.0	4.0	55.0
Interest	4.0	1.5	2.5	63.0
Profit before tax	15.0	12.0	3.0	20.0

TABLE 5: RETURNS ON MODERNISATION IN INDIAN TEXTILE MILLS

Stages of Manufacture	Type of Replacement		Payback Period (Years)
(1) Blow room	Single process auto doffing		50.0
(2) Cards	High production cards—30 rpm		9.5
	—	40 rpm	5.5*
(3) Combers	High speed combers		13.0
(4) Fly frames	High speed canfed inters		17.0
(5) Ring frames	High speed warp ring frames		1.2*
(6) Winding	High speed winding		
	—Barber Colman type		8.0-9.0
	—Autocomer type		3.5*
(7) High speed machine	0.7*		Warping
	Super speed machine		13.5
(8) Loomshed	Auto loom		6.0
	High speed auto loom		10.0
	Shuttleless loom		33.0

IV

Issues in Modernisation

The government of India, faced with a rowing crisis in the textile industry, has dentified lack of modernisation as the najor reason for growing sickness. The igher profit rates and rapid expansion of ome members of the textile industry oligopoly specialising in fabrics of man-nade fibres and blends has also fostered the mpression that the use of advanced techni-ques embodied in the latest generation of extile machinery is the key to survival of irms. In response, the public sector finan-cial institutions are providing subsidised redit and import duties on advanced machines have been lowered. The Indian tex-ile machinery industry has sent numerous delegations to centres in advanced countries o look for collaborations [ITMA, 1979]. Thus Laxmi Machine has entered into colla-boration with Reiter for wider blow room ine and with Investa (Czechoslovakia) for open-end spinning, Mafatlal with SACM for rotor (OE) spinning, and shuttleless looms, CIMMCO with Dornier for Rapier looms [TMMA, 1982:24]. These new machines re-quire a large percentage of imported com-ponents and the manufacturers are forced to modernise their machine shops and tools. The royalty payments for technology and import duties on components make the se-cond generation textile machines 20-50 per cent more expensive than world prices, leading to a pressure by mills to allow duty free im-ports of similar machines [Bhagawati, nd].

Thus while the 'conventional' textile machinery prices in India are about 40 per cent below world prices, the more modern machines are about 30 per cent more expen-sive. If one keeps in mind that the most ad-vanced machines raise the capital output ratios 5 to 10 times (Table 2), then the modernisation is a capital deepening process.

Given the low wage rates in India (amongst the lowest in the world), the sav-ings from the reduction in workforce per unit of output are hardly enough to defray the increased capital costs of introduction of advanced machinery.

This is clearly brought out in a study by ATIRA [ATIRA, 1977], summarised in Table 5. The study was limited to modern machines manufactured in India in 1976 and excludes the latest generation techniques like bale plucking in blow rooms, chute feed to cards, autolevellors, open-end spinning, etc. As Table 5 shows, given the low-level of wages in India, most of the modern machines had pay back periods ranging from 10 to 50 years. The picture would be even more dismal if more expensive third generation imported or import-based machines were to be considered. This, thus, constitutes the most important economic reason for the reluctance of Indian mills to modernise.

The other important factor is that the fibre used in Indian textile industry is still mainly cotton. This is even more true of the mill sector at which the modernisation pro-grammes of the public sector financial insti-tutions are aimed. For example, in 1983, 83.5 per cent of yarn produced by mills was 100 per cent cotton and another 8.5 per cent con-sisted of cellulosic and cellulosic-cotton blends. Thus synthetic and cotton-synthetic blends constituted only 8 per cent of the yarn output in the mill sector [ICMF, 1987:27]

But if modern techniques of production help the Indian textile industry to produce high quality cotton and synthetic fabrics, will not better sales realisation help to amor-tise higher capital costs? Here one is forced to return to the peculiar characteristic of Indian market and the process of incoome generation. The low purchasing power of Indian consumer has acted as the most significant barrier along with the fragmented structure of textile industry. Bulk of Indian cloth is sold at prices range of Rs 6-8 per metre. Studies have shown that machinery renewal even without change in technology in the weaving sheds of composite mills (i e, by replacing non-auto looms with the same type) the capital costs of replacement would require fabric prices to rise to at least Rs 10 per metre [Bhave et al, 1983]. For shuttleless looms that sell in India for Rs 8-10 lakh compared to Rs 15,000-20,000 for non-auto-matic loom the fabric price would have to be at least Rs 25-30 per metre for the moder-nisation to be viable. Same is true of spinning mills where modernisation compels mills to shift their product-mix towards high-priced yarn varieties[Shanbhag, 1985:39].

There is little possibility of the Indian con-sumer paying such high prices for so-called 'better quality' fabrics. Actually, India is one of the few countries where despite rising per capita income, per capita cloth consumption had declined. It is because of the limited market for high priced fabrics (less than 20 per cent of total output [Shanbhag, 1985:47]) that 70 per cent mills that moder-nised slid into crippling losses after moder-nisation. Many of these mills expected to change their product mix towards synthetic blends but found it difficult to successfully sell their products. A powerful and well knit oligopoly has successfully erected powerful entry barriers to this segment of the market [Chandrasekhar, 1984]).

V

Conclusions

Why is it, asked Rosenberg in a well known paper, that in underdeveloped coun-tries, with abundant supplies of labour and scarce capital, the scarcity of capital has not led to the development of capital-saving techniques? [Rosenberg, 1963]. Others, like Well, have been concerned with the rising capital intensity despite factor proportions in such countries favouring labour intensive methods of production [Well, 1975: 71-93].

Rosenberg's answer to this lack of sym-metry between factor endowments and

technical change was simple. Third world countries lack an efficient capital goods sector where new machines are to be produced to change the techniques of production in the consumer goods sector. Improving the efficiency in the capital goods sector which would lower the cost of capital goods would amount to a capital-saving innovation for the economy as a whole. The small size of the home market and the narrow industrial base of the third world economies make it impossible to realise these efficiencies. Given this, the consumer goods industries in such countries are forced to depend on imported technologies and capital goods and possibilities of capital saving innovations are aborted. The use of 'advanced' capital intensive techniques is more pronounced when the investor is a transnational corporation enjoying a monopolistic position [Well, 1975: 85].

The case of Indian textile industry bears out these contentions. One can argue that the 'failure' of Indian textile industry to modernise must be attributed to the inappropriate techniques available from advanced countries and to the efficiency of the Indian capital goods sector. The low and declining cost of textile machinery in India has provided a capital-saving possibility which has been well exploited by the textile industry, both organised and unorganised. Low purchasing power of the people has made the demand extremely price sensitive. An efficient raw cotton producing sector has made any large-scale shift to synthetic impossible without raising the fabric price to the consumer. The advanced techniques' bias towards synthetics has been an additional factor. Thus, the technical change in the advanced countries has only marginal relevance to Indian conditions.

It is difficult to draw economy-wide conclusions on the basis of an industry study. If however, one may take liberties, the question of international (price) competitiveness of Indian industry is far more complex and imports of advanced techniques of production is not necessarily the answer. As a matter of fact, one may argue that if public policy is biased towards imported technology and associated capital goods, this may sunder the links between the user industry and domestic capital goods producers. Such a process would also undermine the future of domestic capital goods sector, depriving the economy of innovations and supply of techniques more suited to our factor endowments. A structural transformation of the economy through a strategy of industrialisation will continue to elude us.

Notes

[An earlier version of this paper is forthcoming in M Eapen (ed), *Indian Industrialisation: Problems and Prospects*, being published by Oxford and IBH. The author is grateful to Nirmal Chandra, Sudip Chaudhuri and an unnamed referee for their comments. I alone am responsible for the errors and omissions.]

1 A semi-log regression fit with time as the independent variable and total cloth availability as dependent variable provides a regression coefficient of 0.0226.

2 The study is based on data from 104 countries and uses (a) inter-country cross-section analysis of relation between per capita consumption of cotton and apparel fibres, and per capita income and (b) multiple regression analysis of mill consumption of cotton cloth and cotton prices and income. Indian Planning Commission projections of demand for cloth are based on similar models with similar elasticity. See, for example, India, 1977.

NOTICE

It is hereby notified for the information of the public that **Lipton India Limited** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Sec. 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new unit. Brief particulars of the proposal are as under:-

1. Name and address of the applicant	:	Lipton India Limited, Dayanand Bhawan, 5/3 Asaf Ali Road, New Delhi 110 002
2. Capital structure of the applicant organisation	:	Authorised Share capital Rs. 2500 lakhs Subscribed Share capital Rs. 1575 lakhs Paid up Share capital Rs. 1575 lakhs
3. Management structure of the applicant organisation indicating the names of the Directors, including the Managing/ Wholetime Directors and Manager, if any.	:	Board of Directors Mr. B.R. Shah Mr. C.J. Mahimker Mr. P.K. Dutt Mr. S.M. Dutta Mr. K.B. Dadiseth Mr. P.M. Sinha Mr. A.C. Chakravorty
4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division.	:	New Unit
5. Location of the new unit	:	Etah (Uttar Pradesh)
6. Capital structure of the proposed undertaking	:	NOT APPLICABLE
7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:	:	
(i) Name of goods/articles	:	Packet Tea and Processed Instant Tea
(ii) Proposed Licensed capacity P.A.	:	10,000 M.T.
(iii) Estimated annual turnover	:	Rs. 50 crores
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc.	:	NOT APPLICABLE
9. Cost of the project	:	Rs. 2.5 crores
10. Scheme of finance, indicating the amounts to be raised from each source.	:	Internal accruals.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Market Structure and Innovation

A Survey of Empirical Studies of Schumpeterian Hypothese for Developed Countries and India

Sanjay Kathuria

This paper seeks to provide a fresh appraisal of the empirical literature that analyses the Schumpeterian hypothese pertaining to the relationship between firm size and market structure, on the one hand, and inventive activity on the other. In the traditional literature on developed countries, the consensus was that large firm size and increasing concentration increased innovative activity only upto a point. However, more recent literature which adopts a more comprehensive approach has questioned the received wisdom. The writings on India, like on other developing countries, have mainly adopted a case-study approach to these questions, and have come up with insightful but as yet non-generalisable conclusions.

I

IN Schumpeter's characterisation of the modern industrial economy, (a) large firms exploit economies of scale in R and D and unforeseen innovations better than smaller firms; (b) monopoly power, which often goes hand-in-hand with large firms, enables the firm to prevent imitations and hence gives them incentives to innovate. Moreover, the process of 'creative destruction' keeps these firms alive to the threat of rival innovators and potential rivals. On this latter point, Schumpeter's observations are instructive:

> It is hardly necessary to point out that competition of the kind we now have in mind acts not only when in being but also when it is merely an ever-present threat. It disciplines before it attacks. The businessman feels himself to be in a competitive situation even if he is alone in his field or if, though not alone, he holds a position such that investigating government experts fail to see any effective competition between him and any other firms in the same or a neighbouring field and in consequence conclude that his talk, under examination, about his competitive sorrows is all make-believe. In many cases, though not in all, this will in the long run enforce behaviour very similar to the perfectly competitive pattern [Schumpeter 1949, p 85].

and in an earlier paragraph:

> But in capitalist reality as distinguished from its textbook picture, it is not that kind of competition which counts but the competition from the new commodity, the new technology, the new source of supply, the new type of organisation (the largest-scale unit of control for instance)—competition which commands a decisive cost or quality advantage and which strikes not at the margins of the profits and the outputs of the existing firms but at their foundations and their very lives [Schumpeter 1949, p 84].

Most of the empirical studies of Schumpeterian hypotheses in developed countries (DCs) have tended to neglect this most important notion of existing and potential rivalry. One of our intentions in this paper, while surveying this literature, is to indicate possible associations of the empirical studies with the concept of existing and potential rivalry.

In this survey, we have identified a dual task for ourselves. In the first part, we shall, as mentioned above, survey the DC empirical literature. This should be seen partly as a complement to the existing surveys, viz, Kamien and Schwartz [1975, 1982] and Scherer [1980], in that, while mentioning all the important findings, we have sought to include and often highlight work that has not formed part of these surveys. More importantly, recent evidence that has been published, after the earlier surveys were completed, calls into question the validity of the earlier conclusions, and occupies a prominent place in our survey. The second part of this survey deals with the literature on India, with a focus on those studies that either explicitly or implicitly analyse the Schumpeterian hypotheses.

Section II mentions the variables most frequently used to explain R and D activity in DCs. The subsequent sections take up each of these variables in turn. Section III looks at the studies on the relationship between R and D and firm size; Section IV on R and D and concentration; Section VI on R and D and technological opportunity; Section VII on R and D and barriers to entry; and Section VIII on R and D and rivalry. In Section V, we point out connections between the variables mentioned above and aspects of rivalry. Section IX briefly examines the case for treating R and D as a capital stock. Section X presents new evidence on Schumpeterian hypotheses. The second part of this survey begins with Section XI, where we introduce the developing country picture of technological change (TC). Section XII looks at the econometric treatment of TC in India, XIII surveys the case-study approach, and XIV sums up the Indian literature. Concluding comments are offered in Section XV. Throughout this paper, we shall be dealing only with TC in business firms and industries, and not in research institutions, universities, etc.

II

Explanatory Variables

A vast amount of work has been done in the last two decades on empirical studies of the Schumpeterian hypotheses; yet most o[f] the substantive claims made are shrouded i[n] controversy.[1] Many different variables hav[e] been adduced to explain R and D behaviou[r] of firms and industries. These variables ar[e] not mutually exclusive, and often overlap. The most important ones to have bee[n] studied are: (i) firm size, (ii) concentratio[n] and market share, (iii) barriers to entry (iv) technological opportunity, and (v) riva[l] R and D behaviour. Each one of thes[e] variables is associated with the degree o[f] rivalry in R and D behaviour of a firm an[d] conditions the environment in which rivalry takes place. The extent of rivalry influence[s] the degree to which a firm can appropriat[e] the benefits from its innovations and, thus determines the incentives for undertaking R and D. R and D is also undertaken as a defensive measure to prevent loss of markets via rival pre-emption. The likelihood of pre-emption is obviously related directly to the degree of rivalry.

The empirical work has been conditioned by availability of data. We shall not discuss the problems that have been caused by this nor, indeed, those relating to the definition of an industry. These are documented in Grabowski and Mueller [1970].

III

R and D and Firm Size

(a) *Size and Research Intensity*: The size of firms was alternately measured by employees, capital assets and sales volume; R and D by R and D expenditure, scientific personnel engaged in R and D, invention patents received, and sales associated with new products introduced. Each measure has its own merits, which are discussed in Kamien and Schwartz [1975]. The general conclusion of these studies is that research intensity (R and D/size) increases up to a certain firm size followed by a constant or even declining intensity (for the US this threshold size is near the bottom of *Fortune's* 500 biggest firms [Scherer 1980, p 420]. The threshold varies from industry to industry. In the chemical industry this pattern is not observed, where there seems to be increasing research output intensities

ith size. In the engineering, metal manu-ctures and rubber industries, patents crease less than proportionately with ze [Needham 1975, p 250].

Later work in this field has grown in phistication. Loeb and Lin [1977] vestigate the R and D-size hypothesis for e pharmaceutical industry, using a speci-cation error approach. They test four ifferent equations, incorporating non-nearities in the structure and find an une-uivocally declining research intensity with rm size. Soete [1979] finds no evidence for his relationship for individual industries ut, at the global level, he finds research in-ensity increasing with size (research is easured by company-financed R and D). oete hopes to have invalidated most of the arlier empirical work. The data he uses is or 1976 and 1977 from *Business Week* but is not clear why earlier data should be 'ob-olete'. Moreover, R and D expenditure is, s mentioned earlier, just one of the many easures that can be used to estimate R and D, and is not the universally best riterion, as Soete suggests. In particular, ur choice would depend on whether we vant to focus on inventive effort or output, nd we may even wish to use more than one easure. We should also remember that R and D expenditure measures only the for-nal dimension of R and D activity, whereas nuch of R and D is informal in character, argely undertaken by smaller firms [Scherer 980, Kamien and Schwartz 1975].

A major problem with Soete's results is is use of a global analysis covering all ndustries (this is true for much of the preceding empirical literature). He has not attempted to standardise data for the effect of differing technological opportunities in different industries; both theoretical and em-pirical literature predict a very significant role for this variable in influencing R and D activity (see Sections VI and X).

(b) *Size and Efficiency*: Estimated elasticities of research output with respect to research input suggest economies of scale at low firm sizes, but diseconomies at large sizes [Kamien and Schwartz 1975]. There seems to be a good deal of evidence to sug-gest that for a piece of work that is within their capacity and resources, small firms are far more efficient. Large firms tend to be cramped, sluggish and bureaucratic. Where they come into their own is in innovation in areas requiring large-scale R and D, product development and marketing.

Link [1980] approaches the efficiency issue via a rate of return criterion for a cross-section of firms in the chemical industry. He finds that a large firm is a pre-requisite for efficient innovative activity (measured by rate of return on R and D expenditure) only up to a point, beyond which the influence of size remains constant. This is at variance with the earlier conclusion that the chemical industry all over the world exhibits a greater than one elasticity of R and D output to firm size.

Link's study is an answer to the criticism voiced by Fisher and Temin [1973] that existing studies relating innovative inputs with firm size do not test the Schumpeterian hypothesis because the hypothesis relates to inventive output and not to input. This is supported by two studies quoted in Link [1980]. It is shown theoretically by Kamien and Schwartz [1969] and empirically demon-strated by Link [1978] that, given economies of scale in production of output and in pro-duction of innovations, the transformation between R and D inputs and innovative out-put is not necessarily monotonic. However, as we have seen, these scale economies do not seem to exist beyond a modest firm size. Kamien and Schwartz [1982] conclude that the use of either input or output measures of inventive activity is justified (p 57). Kohn and Scott [1985] argue that since it is easier to measure R and D input than output, we should try to learn as much as possible about the R and D output—size relation-ship by observing the R and D input-size relationship.[2]

(c) *Size, Liquidity and Profitability*: Large firm size and monopoly power often coin-cide. Firms with high liquidity and pro-fitability are generally large and mono-polistic. This financial slack (alongwith organisational slack), the Schumpeterian hypothesis argues, enables the large firm to undertake substantial investment in R and D. The (large) firm could also look at current profits as an indicator of success of its past R and D efforts and of the likelihood of future profits and therefore go in for higher R and D [Mueller 1967, p 62].

Mueller [1967] estimated a four- equation model of the firm to explain R and D, capital investment, advertising and dividend pay-ments for a 67-firm sample over 1957-60. He found that profits in the R and D equation act as a significant measure of expectations (the coefficient of profits varies directly with the level of overall business activity); depreciation seems to represent the flow of liquidity and is statistically significant.

These results are supported in Howe and McFetridge [1976]: for 81 firms over the period 1967-71, depreciation and after-tax profits are statistically significant for domestic firms. Mueller [1967] and Grabowski and Mueller [1972] write that there are pitfalls in focusing on only one aspect of firm investment behaviour and stress that, especially for policy purposes, the inherent simultaneity of many of the firm's decisions must be taken into account. Each of the dependent variables, R and D, fixed capital investment, cash dividend payments (and also advertising, in the Mueller paper), is assumed to be a function of the others and a group of predetermined variables. The equations are estimated by simultaneous equation techniques.

The multi-dimensional focus is vindicated when Mueller [1967] finds that resources shift into different activities in response to variations in the industrial climate. In reces-sionary years, for example, the returns on capital investment are lower than normal, and depreciation funds are diverted into R and D, the returns from which are less subject to cyclical fluctuations. Mueller also finds that absolute R and D outlays decrease with firm size, and seeks to explain it away by citing the superior explanatory power of the other variables, like profits, depreciation and a ten-year growth variable, as these are stated to be better indicators of uncertainty and demand-pull factors.

The paper by Grabowski and Mueller adds another dimension to Mueller's article. They incorporate a managerial and a stock-holder maximisation objective in two dif-ferent models. The equilibrium condition in both cases is that the marginal rate of return on each investment activity should be equated to the marginal cost of finance. The differences arise in the set of exogenous variables that are expected to be important. For example, the level of cash flow should strongly influence the managerial firm's marginal cost of finance (MCF) schedule, but is irrelevant for the neo-classical firm's investment decisions (the neo-classical variant is used to express stockholder max-imisation), where stockholder opportunity cost replaces cash flow in the MCF equa-tion. Also, dividends in the neo-classical case are not codetermined with R and D and capital investment.

Using data for 66 firms in seven industries over the period 1959-66, Grabowski and Mueller find that, in the managerial model, the most significant of the exogenous fac-tors in the R and D equation are the cash flow terms. Analogously, the cost of capital variable is most significant in the stock-holder model. However, the explanatory power of the stockholder model is much lower (R^2 is 0.025 as opposed to 0.37 in the managerial case), and Grabowski and Mueller come out strongly in favour of the managerial model as a superior theory of motivation.

The importance of liquidity is also sup-ported in a time-series study by Grabowski and Baxter [1973]. On the other hand, there are a number of studies which point in the opposite direction.[3] Scherer [1980] points out that this could be due to the fact that there may be a two-way causation: high pro-fits might cause higher R and D spending, but successful R and D could, in turn, lead to higher profits (with a lag). A careful study by Branch [1974] estimated distributed lag functions and found that the effect of R and D output (patents) on pofits was more consistent and statistically stronger than the effect of profits on patents.

The work by Branch indicates that there is no a priori reason why different aspects of firms' investment decisions have to be treated simultaneously as done by Mueller and Grabowski and Mueller—there could be a sequential process taking place. The lack of clear-cut evidence leads Kamien and Schwartz [1982] to conclude that the support for the hypothesis that liquidity or pro-fitability are conducive to innovation is slim. They do add, however, that this does not

negate their importance, and perhaps liquidity or profitability could be 'threshold' factors, necessary to some extent for R and D, but has no linear relationship with it.

d) *Size and Diversification*[4]: Diversification is distinct from large size and market power but will very often accompany them. In a world of uncertainty, with inventions and discoveries in unexpected areas, diversification into many products will positively influence a firm's expected profit from R and D effort. Also, the very range of the firm's interests implies an effective cushion against risk, which the less diversified firm does not possess. On the whole, there is weak support for this hypothesis. One study found that the advantage of diversification for research is confined to a branching out by the firm into technically related products within the same two- digit industry group.[5]

Armour and Teece [1980] explore another strategic decision of the firm—vertical integration. They find a statistically significant and positive relationship between vertical integration (measured by participation in an additional stage of the petroleum industry production process) and basic and applied research for firms in this industry over the period 1954-75. A positive relationship is also found between the diversity variable (the number of activities in which the firm is involved) and basic research, although it is not significant. Another notable result to emerge from this study is that the R and D expenditure geared to more specific projects is not influenced much by diversification.

The part of the Schumpeterian hypothesis tested in the literature on (firm) size has it that the large firm is in a better position to generate technical progress, given the demands of modern technology. From the available evidence it appears that the advantage of large firm size for R and D exists up to a threshold size which varies from industry to industry. This evidence does not reflect informal R and D, which is often the domain of small firms. Another point in favour of the small firm is that the sequential character of modern R and D makes it possible for them to play a major role in technological innovations. Large firms are responsible for much of the development of these ideas and innovations towards commercial utilisation. On the whole, small firms contribute more to technical advance of society than is reflected in R and D expenditure statistics.[6]

IV

R and D and Concentration

The causal link that is normally explored goes from concentration to R and D. A highly concentrated market structure, it is argued, insulates the dominant firms from competitive pressure and enables them to appropriate the fruits of their innovations. Antagonists say the presence of market power with concentration enables the firm to reap profits without necessarily being innovative.

The empirical literature reflects this indeterminancy. There is little consensus on the effect of concentration on R and D. In most cases, a statistical relationship has not been observed between these variables [Kamien and Schwartz 1975, p 22]. Rosenberg [1976] selects firms at two extremes of technological opportunity, and finds a tenuous negative relationship between market share (which is correlated with concentration) of the firm and its R and D intensity. Shrieves [1978], using a sample of 411 firms in 1965, concludes that the role of concentration appears to be ambiguous when the manufacturing industries are divided into 'sectors' characterised by different product-market features. Needham [1975] believes that firm size and the implied market share influence R and D independently of any effect of seller concentration, so that, in order to test whether R and D is independently related to concentration, it is necessary to eliminate the aforesaid influence of market share. Needham quotes a study by Comanor [1967] which finds that, for given levels of firm size, higher concentration may be associated with greater research in industries where prospects for product differentiation are limited. There is no evidence for this relationship in industries where product differentiation is important.

Two recent studies also come out with opposing conclusions, reflecting the lack of consensus. Using the number of successful innovations as a measure of R and D output, Acs and Audretsch [1988] find a negative relationship between this measure and the degree of concentration. Kraft [1989] also uses an indicator of R and D output—the percentage of sales that can be attributed to products developed during the last five years. A cross-section analysis for 57 West German firms in 1979 finds an unambiguously positive relationship between product innovation and the degree of concentration (proxied by the inverse of the number of main competitors in the major markets in which the firm operates).

Farber [1981] points out a variable that is rarely noticed in the extant literature. He finds that R and D activity would increase with buyer market concentration when the sellers' market is concentrated, but may decline with buyer concentration when the sellers' market is unconcentrated. He also found evidence that the effects of seller concentration on R and D intensity might be biased upward due to not controlling for buyer concentration and price-cost margins.

It appears that the relationship between R and D and concentration is particularly murky. One reason is that (as is also true for firm size) concentration is related to many other variables like profits and entry barriers in a simultaneous manner: it affects them and is affected by them in turn. Thus seller concentration may influence R and D via a number of different channels, and the statistical relationship observed is the net outcome of many different relationships interacting simultaneously with both R and D and concentration. R and D and concent[ra]tion should themselves be treated in [a] simultaneous framework. Another probl[em] is the use of concentration ratios as the re[le]vant concentration concept [Kamien a[nd] Schwartz 1975, p 20].

A limited body of research also looks [at] the reverse causation, viz, the effect [of] innovation on concentration. The mo[st] quoted study in this regard is the one [by] Blair [1972], who, by looking at the effe[ct] of technical change on minimum efficie[nt] plant size, found that, since World War Tw[o] centralising technologies have been displac[ed] by decentralising technologies, becau[se] recent technical advances have tended to pe[r]mit production with smaller plants. A pap[er] by Mansfield [1983] is more circumspe[ct] and cautions against predicting the effect [of] technological change on concentratio[n] unless the nature and sources of ne[w] technology are known. In a study of th[e] chemical, drug, petroleum and ste[el] industries he finds no evidence to suppo[rt] Blair's hypothesis. On the other han[d] Mukhopadhyay's [1985b] study is supporti[ve] of Blair's conclusion, although the autho[r] makes no mention of the latter's stud[y]. Using econometric analysis, his paper show[s] that during 1963-77, concentration ratio[s] decreased in the high-R and D industries [in] the US, and he explains this by observin[g] that the net rate of entry was much highe[r] in these industries.

V

Aspects of Rivalry

We have so far looked at R and D in rela[]tion to firm size and concentration and th[e] related variables. The Schumpeterian hypo[]thesis that pertains to firm size stresses th[e] importance of the supply side factor[s] (resources, skills, abilities) for R and D; con[]centration and monopoly power are con[]sidered important because they enable th[e] firm to internalise the benefits of thei[r] innovation, their presence giving the firm a[n] assurance that they are at least temporaril[y] safe from profit erosion. These arguments, however, concentrate on one aspect of the Schumpeterian hypothesis and neglect th[e] stimulus factor. Schumpeter stressed th[e] paramount importance of potential rivalr[y] in keeping a firm on its toes and hence i[n] engaging in R and D continuously. Indice[s] like the concentration ratio which focus o[n] the current market structure are not indi[]cative of potential rivalry[7] (one manifesta[]tion of which is rivalry in R and D). On[e] way to incorporate potential rivalry would be to consider the conditions of, and scope for, entry into the industry. A more complet[e] characterisation would also consider entry into R and D activity.

The next two variables that we will consider come closer to this concept than firm size or concentration. The 'barriers to entry' variable, even though it is related to concentration, looks beyond it to other factors

e advertising and capital intensities. With gh barriers to entry, there may not be too any rivals to contend with. The 'techno-gical opportunity' variable, conditions the traction *inter alia*, of entering the industry id also of joining the R and D race. hrieves [1978] expands on this theme, as e shall see.)

VI

and D and Technological Opportunity

Technological opportunity may well be the ngle, most important determinant of and D, for it is accepted that the intensity f R and D effort is strongly correlated with e indices of technological opportunity, no atter how the latter is measured. It also apes the environment for other deter-inants of R and D. After differences in chnological opportunity are taken into ccount, the correlations between R and D nd other explanatory variables tend to ecome weaker and statistically less signifi-ant [Scherer 1980].

Rosenberg [1976], in a cross-section study f 100 American firms in 1963-64, finds that igh technological opportunity is the trongest and most significant explanatory ariable for research intensity in two of three quations. Wilson [1977] suggests that there re two relevant dimensions of the techno-ogical environment which ought to be onsidered—the richness of opportunities or product-change arising from exogenous dvances in science and technology or op-ortunity; and the ease with which physical haracteristics of a product can be altered r complexity. These are not necessarily ndependent of one another. The presence of rich possibilities for product innovation imits research effort directed towards pro-ess innovations, and hence also limits licen-ing (process innovations are more readily icensable) from that source. However, op-ortunity for product technical advances often leads to breakthrough product innova-ions which belong to the most licensable ategory. The hypothesis, then, is that op-ortunity influences both product innova-ion effort and licensing positively, while omplexity influences product innovation ositively but licensing negatively. For the omplexity dimension, Wilson uses the share of a durable goods industry's output sold to he final demand sector on the grounds that durable final goods allow for the most com-plex configuration options. For the oppor-unity dimension, 'high' and 'low' dummy variables represent high and low opportunity ndustries. This classification is admittedly entative.

With firm-level data from 350 firms for 1971, Wilson finds the coefficients signifi-cant as predicted in the above hypothesis. The implication is that licensing may be a elevant variable to consider in the situation of R and D rivalry—licensing of inventions can be used to achieve joint profit maximisa-ion by saving imitative research costs.

Shrieves [1978] points out that the crucial differences in the controversy over the relationship between market structure and innovation lie in the respective assumptions regarding the speed and ability of rival imitation. While a measure for this 'degree of technical appropriability' is not available, it is likely to be related systematically to technological and product-market characteristics. Technological characteristics of a firm are represented by an index of the ratios of the number of R and D scientists and engineers employed in various scientific disciplines to total R and D employment figures. Product-market characteristics are indicated by input-output ratios on sales of consumption goods, investment goods, materials and sales to government, and also a durable goods dummy variable. He finds that the rate of imitation of innovations would be greater in the non-durable consumer goods and material inputs industries, because technological complexity in them is less and because of the repetitive nature of the demand in these industries. In such industries, concentration is conducive to innovative activity. On the other hand, in durable goods the existence of a 'first mover' advantage may dampen the pressure to innovate if the industry is concentrated. Shrieves' results are significant because they stress that the technological characteristics of an industry account for a large part of R and D activity, and that these may interact in a complex way with concentration to determine R and D levels. Scherer [1980] suggests that in high-opportunity and rapidly-shifting industries, fear of market overcrowding is less likely to deter vigorous innovative effort. In low-opportunity fields, technological pioneering may be realtively unprofitable, so that only companies with a substantial organisational slack (like large firms in concentrated industries) may engage in R and D.

We have found that consideration of technological opportunities clears up a substantial portion of the ambiguity surrounding the R and D concentration relationship. It seems that concentration may have an independent influence on R and D, and that this is positive in low opportunity industries. In Section X, more recent evidence is presented and this serves to re-emphasise the significance of technological opportunity. It also brings into question the role of concentration as an independent factor.

VII

R and D and Barriers to Entry

Low entry barriers give rise to fear of imitation and erosion of profits; high entry barriers to lethargy. What is needed is an optimal combination of both. This, it is suggested, occurs when industries have moderate barriers to entry. Comanor [1967] depicts these in terms of a four to seven per cent share of industry output by a firm and/or a capital investment of $20 million to $70 million. He finds that R and D intensity is positively influenced by moderate entry barriers. Rosenberg [1976] defines entry barriers in terms of advertising, capital intensity and returns to scale. In a sample of 100 companies from the *Fortune 500 Directory*, he finds that high barriers are conducive to R and D. He seeks to explain away the difference between his and Comanor's results as variations in sampling, measurement of barriers, and industry definitions. He also finds that entry barriers complement the impact of federal government subsidies in encouraging R and D. The introduction of entry barriers to the equation, he feels, comes at the expense of the technological opportunity variable. A more recent study by Farber [1981] finds R and D intensity diminishing in the presence of high financial and technical barriers to entry.

Porter [1979] has suggested a different line of enquiry on the subject of entry barriers. The structure within an industry, he says, is an important explanation of variation in profit rates among the firms in an industry. Traditionally, firms within an industry are assumed to be alike in all economically important dimensions except size. It is useful to view an industry as composed of clusters of groups of firms, where each group consists of firms following similar strategies in terms of the key decision variables. These groups are called 'strategic groups'. They are not properly defined industries, because they reflect 'different approaches to operating in the same competitive arena' (p 215). These different approaches manifest themselves in marketing methods, technologies and scales of activity; and the standard sources of entry barriers (economies of scale, capital requirements, cost advantages and proprietary knowledge) can also vary across strategic groups. For example, product differentiation barriers will be greater for a more heavily advertised national brand than for a local brand name. It follows that there can be a barrier to entry into the industry as well as into strategic groups within the industry. This latter barrier exists both for new firms and for firms already in the industry. Porter calls these dual-function barriers 'mobility barriers'.

The presence of strategic groups influences inter-firm rivalry as well. Divergent strategies increase the likelihood of rivalry because the ability of oligopoly to have tacit co-ordination is reduced. Overall, the structure within an industry consists of its configuration of strategic groups, including their mobility barriers, size and composition, strategic distance and market interdependence.

In his empirical investigation, Porter used a simple, *ad hoc* procedure, identifying the relative size of a firm in an industry as a proxy for its strategic group membership. He then divided firms in an industry into leader and follower firms. Leaders were the biggest firms accounting for 30 per cent of total industry sales; the others were followers. The leader group will, it is expected, include strategic groups whose strategies are geared

toward achieving scale economies, vertical integration, a marketing network, and so on, if these exist in the industry. The follower group may include strategic groups following more specialised strategies. The distinction between leader and follower should therefore capture at least some of the variance among strategic groups. The forecast then is that different structural models will be appropriate to explain average firm profitability in the leader and follower groups. This forecast is supported by the findings: leader group firms are on the whole more profitable; concentration has a positive effect on their profits, but has a negative influence on followers' profits; growth and capital requirements, advertising, production scale economy, and so on, also have strongly asymmetrical effects on leader and follower groups.

Perhaps these ideas could be fruitfully developed to try and explain R and D behaviour of firms and industries. For example, we could expect firms in strategic groups with moderate mobility barriers to have high research intensities, other things being equal. The assumption that we can identify groups within an industry is attractive. We can expect inter-group rivalry to be important and firms within a group may indulge in tacit or open co-operation. The definition of strategic groups makes use of many of the variables we may consider to be important in explaining R and D activity (e g, diversification, vertical integration, scale of activity, entry barriers, and so on). It will not be surprising, therefore, to find R and D intensities varying across strategic groups even if other things are equal.

As Porter discovered, the practical problem is to identify different configurations of strategic groups. Detailed industry studies would be able to tackle this problem more effectively than cross-industry studies based on secondary data.

VIII

R and D and Rivalry

Few studies have attempted to come to grips with this issue in practice. It is accepted that investments in R and D are especially difficult to co-ordinate at joint profit-maximising levels [Scherer 1967, Grabowski and Baxter 1973], and so a particularly important form of rivalry is in R and D.

Scherer [1967] uses simulation techniques and specific assumptions on parameter values to come to the general conclusion that rivalry stimulates rapid R and D. Grabowski and Mueller [1978] suggest that greater concentration in research-intensive industries leads to increased intra-industry rivalry in R and D—an inference they substantiate empirically.

Grabowski and Baxter [1973] have conducted one of the rare studies that looks at competitive interaction in R and D expenditures of firms within an industry. Since then, we have also attempted a similar exercise for firms in certain US industries [Kathuria 1982]. These studies look at potential rivalry in a more direct and identifiable form than the earlier ones which examined technological opportunity and barriers to entry. It also means, however, that only potential rivalry from immediate rivals is considered, and that the equally important rivalry that could emanate from unknown firms is not incorporated.

The premise Grabowski and Baxter start with is that while there will always be some a priori analytical ambiguity associated with competitive interactions in oligopoly, we can nevertheless expect an aggressive response to R and D outlays, given the structural and psychological climate in which it is undertaken. They use a sample of eight firms in the US chemical industry for the period 1947-66. The chemical industry is particularly appropriate, since it is highly research-intensive and has several large firms undertaking substantive research.

The equations were estimated for every firm. The dependent variable was change in the firm's R and D expenditure since the preceding year. The explanatory variables were (1) one-year lagged change in a rival's R and D outlay, (ii) lagged change in own R and D outlay, (iii) change in cash flow, (iv) change in market valuation of firm (b) a dummy variable to reflect decline in earnings or sales (the hypothesis being that a depressed investment climate leads to shift of resources into R and D, which is not subject to the same sort of cyclical fluctuations as other types of investment (see Section III).

Almost all the coefficients from the eight equations estimated turn out to be of the postulated positive sign; the most significant are those for the cash flow variables. The coefficient of rival R and D is significant in four of the eight equations,[8] and is especially strong in the case of the two largest firms responding to each other's outlays.

The fitted equations reveal an interesting result the authors have not fully noticed. The only significant coefficient in the equation of the leader firm is the coefficient of rival R and D. Moreover, this coefficient is larger than in any of the other seven equations. On the other hand, the dummy variable, cash flow, and own R and D coefficients are not only statistically insignificant but also smaller than the corresponding figures for the other seven firms in 17 out of the 21 cases (all the exceptions being in the own R and D coefficients column). This seems to lend support to a hypothesis akin to 'Stackelberg behaviour' by the leader, and something approaching 'Cournot behaviour' by the smaller firms. The leader firm works on the reaction function of the second firm. For the former this activity is to be pursued at a priority level, which implies that one of its very important goals could be the preservation of its market share by keeping ahead in the R and D race. The Cournot postulate for the other firms is more open to challenge, but the dominance of non-rivalry motives in a majority of the firms offers so[me] evidence to back it up.

Using cross-section analysis for 29 i[n]dustries, Grabowski and Baxter also try [to] prove that concentration increases R and [D] rivalry. They do this by finding the coef[fi]cient of variation in research intensity acro[ss] industries to be inversely related to eigh[t-]firm concentration ratio. However, th[ey] agree that this is only a very tentative co[n]clusion, given the many other forces influe[n]cing R and D, and the more severe econ[o]metric problems associated with cros[s-]section data.

In a later study [Kathuria 1982] we use[d] firm-level data for four US industries fro[m] various issues of *Business Week* [1977-1982]. Since time-series data was available for fi[ve] years only, we made the assumption tha[t] firms within an industry have the sam[e] behavioural pattern and accordingly poole[d] this data. The model draws heavily from th[e] work of Grabowski and Baxter [1973]. Th[e] dependent variable is percentage annu[al] change in R and D outlay; the independen[t] variables are also in the form of percentag[e] annual changes.

While the most significant and consisten[t] explanatory variable turns out to be curren[t] profits, there is evidence to support th[e] hypothesis of R and D rivalry (with a on[e-] year lag) in three of the four industries; i[n] the fourth industry, aerospace, potentia[l] rivalry from outside the industry seems t[o] be more important in the form of th[e] European Airbus. Other than in food an[d] beverages, profits are significant at the 9[5] per cent level for the equations in each o[f] the other three industries (aerospace[,] semiconductors, information processing)[.] One explanation is that the food industr[y] moves along at a sedate pace, with growth opportunities limited, and research intensity is only 0.6 per cent of sales. The other industries are highly research intensive and the technologies are fast changing, and the potential rewards for innovation are very substantial. Profits may therefore be appearing as a constraint in the R and D activities of firms in these industries, and so additional profits will boost R and D. These results support the self-finance arguments of Kamien and Schwartz [1978].

It is possible, as Grabowski and Baxter point out, that in an interdependent and uncertain environment, competitive response patterns of the type observed may be perfectly compatible with profit maximisation or other objectives; indeed, it is an example of an 'adaptively rational' decision-making approach.

IX

Capitalisation of R and D

Grabowski and Mueller [1978] argue that empirical work has ignored the capital investment character of R and D. As in the case of fixed capital investment, the effect of investment in R and D lingers beyond the immediate time period in which it is

nvested. They find that the variance of profit rates computed after incorporating R and D as an R and D stock is reduced. Allowing for this more realistic picture of R and D may not alter the nature of the conclusions we reached in this paper. But it could make the observed relationships more stable.[9] Some of the immediate possibilities that come to mind are related to the interaction of profits and entry barriers with R and D: present profits are influenced partly by an appropriate sequence of lagged R and D expenditures (profits in turn influence R and D investment); current entry barriers created by R and D are the result of a lagged series of past and present R and D expenditures. A related theme is concerned with firms reacting to an appropriately lagged R and D expenditure of the leader firm, rather than just to a one-period lagged R and D, as in Grabowski and Baxter [1973].

X

New Evidence on Schumpeterian Hypotheses

Recent theoretical developments have looked beyond unidirectional causation, and have attempted to model the inherent simultaneity between market structure and innovation. Innovation generates transient market power which in turn is eroded by rival innovation and imitation (in the spirit of Schumpeter's creative destruction). For a review of this literature, see Kamien and Schwartz [1982], Kathuria [1982] and Dasgupta [1986]. Also see Nelson and Winter [1982] for a very interesting simulation approach. This simultaneity implies that market structure and innovation must be jointly determined by more basic factors: demand conditions, technological opportunities, nature of capital markets, and technological and institutional conditions governing appropriability. So far, however, most of the empirical studies that are reviewed in the following pages have not analysed innovation and market structure in a simultaneous framework but the majority of them do analyse the role of basic variables.

One study that has treated concentration and R and D intensity (and also advertising intensity) as being jointly determined by the profit-maximising actions of individual firms is the one by Levin and Reiss [1984]. They use 'at best crude proxies' for technological opportunity and appropriability—five industry dummies, share of basic research in total R and D, age of the industry, government-funded R and D, share of R and D devoted to new products and share of process R and D that is borrowed rather than generated internally. Using data for 20 industries for three years, they find that:

> ...on the whole the findings support the Schumpeterian view that R and D investment and market structure are appropriately regarded as jointly determined outcomes of the competitive process. The private R and D equation performs especially well, yielding results that are quite robust and yet sufficiently precise to reject decisively the hypotheses that opportunity and appropriability conditions do not matter [Levin and Reiss 1984, pp 201-02].

They find a strong positive effect of R and D on industry concentration and a negative effect of concentration on R and D intensity which becomes positive for industries having higher product as opposed to process R and D.

The R and D equation performs relatively better than the one for concentration, which could be explained by the dynamics of the situation [see Tandon 1984]. The effect of technological change on concentration is likley to be a long- term effect, one not easily captured in the Levin and Reiss data which spans only ten years. On the other hand, the reverse causation is more likely to be a short-term one.

Pakes and Schankerman [1984] develop a model that integrates what they call 'three competing explanations' of R and D activity—expected market size, conditions of appropriability for innovation, and technological opportunities. They use data for 433 large firms in 1963, and perform regressions separately for four broad industry groups. Data limitations and model specification require them to specify opportunity and appropriability as unobservable factors in a way that allows assessment of their joint effect on R and D intensity. They find that the observed variation of R and D intensity of firms within an industry can be explained primarily by inter firm differences in appropriability and technological opportunities, and not by growth rates of the firms. After aggregating the firm-level figures to the industry level, it is found that inter-industry variations in R and D intensity are primarily accounted for by industry growth rates. These findings have been interpreted to mean that industry differences in technological and market opportunities predominate in the firm's decisions. In other words industry-level factors are more important than the firm's own history and specific abilities in explaining R and D intensity at the firm level.

Bound et al [1984] have, according to Cohen et al [1987], used a larger and more comprehensive sample of Amercian firms than any earlier study of the R and D-size relationship at the firm level. Using a sample of 2595 firms, they came to the conclusion that both very large and very small firms are more R and D intensive than average-size firms, which is contrary to the consensus that R and D intensity increases up to a threshold size (see Section III). Although this study is not in the mould of the others reviewed in this section, we have included it here because of its comprehensive approach. It does in fact attempt to take industry-specific effects into account by putting in 21 industry dummies, although these are admittedly poor substitutes for the kind of appropriability and opportunity variables developed by Richard Levin and his colleagues.

All the studies reviewed so far in this essay have employed somewhat crude proxies for the opportunity and appropriability variables, because they cannot, for example, distinguish adequately between differences in ease of imitation and strength of patent protection. In an effort to capture the effect of these factors more accurately, Richard Levin et al [1985] have collected primary data on appropriability and opportunity from a survey of executives in 130 industries. The variables used to represent technological opportunity were closeness to science, external sources of technical knowledge, and industry maturity. For appropriability, the effectiveness of various mechanisms (patents, secrecy, lead time, and so on) was characterised on a seven-point scale. The survey data was used to explain differences in the Federal Trade Commission data on industry-level R and D intensity. The authors find that when the survey variables are included in their equations, the regression coefficients for 'concentration' fall by an order of magnitude and become statistically insignificant and the appropriability and opportunity variables were jointly significant. This is true for the R and D input as well as output equation. However, the appropriability variables were not individually significant in the R and D input equation.

In a more recent paper that uses the same data base, Cohen et al [1987] explore the firm size-related implications of Schumpeter's hypotheses. They criticise previous literature for ignoring the multiproduct character of firms. They distinguish between size of the business unit (operating in a particular product line) and size of the firm. After removing outliers from the data, and controlling for inter-industry differences in the R and D environment (using appropriability, opportunity, demand and concentration variables), Cohen et al find no relationship between firm size and research intensity. Business unit size did affect significantly the probability of doing R and D, but it did not influence R and D performed within the group of R and D performers. Also, the magnitude of the size effects (either business or firm size) is always minute, explaining less than 1 per cent of the variance in R and D intensity, whereas industry characteristics explained half the variance.

Another study that has employed primary data is the one by Pavitt et al [1987]. They have made use of the extensive Science Policy Research Unit Survey of 4378 innovations in the UK since 1945. They have attempted to not only analyse the influence of firm size on innovation, but also that of innovation on firm size and performance. From the 1950s to the 1980s, small (500-1000 employees) and large (more than 10,000 employees) firms had above average innova-

tion intensity (defined as share in innovation to share in employment) while medium-sized firms (2000-9999 employees) had below average intensity. Moreover, over the four decades, the very small firms (1-499) employees saw an increase and the medium-sized firms a decline in their innovation intensities. The authors posit, supporting Bound et al [1984], that the relationship between firm size and innovative activity (R and D/sales or innovation/sales) is U-shaped rather than r-shaped (declining after a point), and growing increasingly so over time. They also find that

> technological opportunities that result in large firms have less to do with the requirements of scale in production, than with the possibilities for R and D-based diversification into related product markets.

Inter-sectoral differences in technological behaviour are also analysed. More details on sectoral patterns will be found in two papers by Pavitt [1984] and Robson et al [1988], and which point to the pitfalls of attempting generalisations in the conceptualisation of technological change.

The difference between these and earlier approaches[10] is that there is now an attempt at a more comprehensive approach toward understanding the basic determinants of R and D and innovation. Although nothing conclusive has been proved so far, the new approach and evidence cast some doubt on the received empirical wisdom that has been surveyed earlier in this paper. Thus, for example, whether and to what extent market structure has an independent influence on innovation is now (more) inconclusive.

XI
The Developing Country Picture

The theoretical literature on TC relates mainly to developed countries. Empirically, however, development economists have taken much interest in the process of TC in the third world, particularly in the last decade,[11] although the approach has been somewhat different from the previously reviewed literature.

The developed country empirical literature has focused on the analysis of R and D expenditure by companies, partly because data on R and D output tends to be incomplete. In reality, however, TC emanates not only from formal R and D expenditure, but arises from other divisions of a company such as production plants, tool and die-making plants, ancillary development, marketing, etc. This kind of TC, which includes the 'learning-by-doing' variety, is almost always of an incremental as opposed to breakthrough, nature. Most of the DC literature has tended to ignore the very significant role that incremental TC has played in overall technical advance.

In developing countries, incremental innovations are even more important than in the developed world. Most manufacturing enterprises do not have the capability to produce frontier technologies. They usually start off by implementing technology borrowed from abroad. A major part of their TC efforts are determined by the need to use different raw materials, scale down plant size, diversify product mix, adapt product design, use simpler and lower capacity machinery, etc. This is because conditions in developing countries tend to be very different—markets are usually smaller, functional characteristics of a product are more important than aesthetics, there are local-use regulations, etc.[12] Moreover, there is always incomplete information in any technology transfer, so that every firm will develop a unique or 'idiosyncratic' production function. This description makes it apparent that non-R and D departments of developing country firms are likely to be equally involved in the TC process.

In order to capture this reality, development economists have tended to focus on description and analysis of TC of individual firms and industries, relying heavily on qualitative evidence. The trade-off has been the non-generalisability of the findings but rich insights have nevertheless been generated.

All this is as true for India as for the other industrialising countries that have been studied. While the evidence for India is diffused in terms of coverage of issues and industries, a pervasive theme is the influence of government policy on R and D, both directly as well as indirectly via its effect on market structure.

Our survey includes studies that have looked not only at own R and D but also at imported technology as a source of TC, since the latter is very important in developing countries.

XII
Econometric Analysis of R and D in India

Subrahmanian [1971a] finds no evidence for the Indian chemical industry to suggest a positive relationship between R and D intensity and firm size, or between R and D intensity and relative firm size (used to indicate market power). This is therefore contrary to the finding that in the international chemical industry, research intensity increases with firm size (see Section III). The deficiency in the analysis is that no factors other than firm size are considered. In a subsequent article on the same data set (although a reduced one), Subrahmanian [1971b] does consider other variables such as profits, retained earnings, depreciation, gross investment and lagged R and D expenditure. He then finds that absolute R and D expenditure is positively related to size, as also to depreciation and lagged R and D. However, we are given no estimates of the elasticities, and it cannot therefore be established as to whether R and D increases more than proportionately with firm size.[13]

In another econometric analysis of R and D activity in 100 engineering firn Lall [1983] found that R and D intensity positively influenced by size, age a technical absorptive capacity (proxied percentage of total wages and salaries pa to employees earning more than Rs 3000 p month) of the firms. Unlike in DCs, India engineering firms have not reached threshold size and this, Lall suggest explains the positive relationship of size ar R and D.[14]

Yet another cross-section study, this tim at the industry level, was done by Katra [1985]. He finds the elasticity of R and expenditure with respect to sales to be le than unity, which is contrary to Lall's resu above. However, there could be a number c reasons for this. Katrak's sample is a mix c different industries, unlike Lall's. We hav seen that technological opportunity could b a decisive influence on R and D, and Katra has not taken account of this[15]. Secondl Katrak's data relates to industries and nc to firms, and this, as he himself acknow ledges, could affect the results. Finally, Lall data is more detailed and permits testing fo a much larger number of variables.

Katrak has attempted to resolve some o these problems in a later paper.[16] Firm-leve data was collected for 51 enterprises, an published data for another 300 firms wa used. As in the earlier paper, larger enter prises were found to spend proportionatel less on R and D, both for technology im porting and non-importing firms as a whol as well as for technology importers only Katrak classified his sample firms as belong ing to either 'low technology' or 'high technology' sectors, but this still permits a large degree of heterogeneity within each o the two categories[17] and does not resolve the problem of different degrees of technica opportunity.

Siddharthan's [1988] paper comes up with conclusions different from both Katrak and Lall. He uses published data for 166 manufacturing firms for the year 1983-84, and finds a U-shaped relationship between R and D intensity and sales turnover, with the turning point occurring at a sales level of Rs 600 million. A similar relationship is also observed when separate regressions are performed for electronics, machinery and textile firms. However, for chemical firms, he finds a negative relationship between R and D intensity and size since the quadratic term is not significant.

In a more comprehensive coverage of Indian industrial R and D, Kumar [1987] analyses 1143 companies in 43 manufacturing industries, based on RBI data. He explores the other Schumpeterian hypothesis, viz, the role of market structure, using a four-firm concentration ratio. The company-level data has been aggregated to the industry level by adding up. He controls for technological opportunity by introducing variables such as capital intensity and skill intensity, employs dummies for engineering, chemical, consumer and consumer conve-

ience goods, and also brings in advertising intensity (advertising expenditure to sales atio). Kumar finds that R and D intensity negatively related to concentration, which ould occur because in India concentration ften arises on account of government policy hich protects firms from both domestic as ell as import competition. In addition, umar also finds a negative relationship between R and D intensity and direct foreign nvestment in Indian firms, but a positive elationship with licensed use of technology.

This strand of the technology literature of ndia, following in the mould of its DC ounterpart, suffers from the same limitaions as the latter but to an even greater egree, partly because of data limitations. n addition, many of the Indian studies have sed industry rather than firm-level data, which tends to wash out the effect of firmevel variables such as size, technical capaity, age, and so on.

XIII

ase Study and Other Approaches

A pioneering study on industrial change n India from 1937-55 by George Rosen 1958] documents, *inter alia*, TC in cotton extiles, cement, paper, iron and steel, and ugar. Rosen considers TC in terms of the ntroduction of new machinery. In cotton extiles, Rosen concludes that competitive ressures in the domestic market and for ompeting in international markets were forcing the introduction of both labour-saving as well as quality-improving and outputwidening machinery. These pressures were reinforced by the old vintage of machinery and the wage movements in the industry. Institutional constraints on expansion and a ban on certain types of machinery also played a part. Rosen finds that investment in new machinery is much more in firms with investible reserves, and this was widening the gap between the efficient and inefficient firms. Industries other than cotton textiles were all expanding ones and were able to introduce labour-saving machinery by absorbing the displaced labour force.

The general influences on the introduction of labour-saving machinery are identified by Rosen to be the need to import machinery from abroad, which was laboursaving; the availability of reserves within firms; government policies which raised the relative cost of labour to capital; and the competitive market situation which meant that firms which did not introduce such machinery were left progressively behind.

Another form of TC that can be considered is the import of technology. An NCAER [1971] study shows that of the number of technology collaborations by Indian firms up to 1967, two-thirds had been made by firms with sales of less than Rs 50 million, i e, firms that were small or medium even by Indian standards (this of course does not mean that collaborations per firm are higher for small firms). Moreover, it found that the import content of technology decreased with the size of the firm because larger firms have the ability to complement parts of the technology package with their inhouse R and D capability. On the basis that licensed technology is superior to other production know-how (the former involves more comprehensive involvement by the seller and bears higher royalties), the study shows that larger firms which obtain a higher proportion of licences than other production know-how, receive and exploit better quality technology than smaller firms. This was also confirmed by interviews conducted by the study team. The success rate of technology agreements was found to be unrelated to the size of firm, but positively related to the number of earlier collaboration proposals, thus exhibiting a learning sequence through import of technology.

The NCAER study, which is based partly on questionnaires and interviews, states that firms that did substantial R and D emphasised the relative (to imported technology) cost and time factors. *Ceteris paribus* the slower the growth of the domestic market, and the less the chance of another firm entering into it earlier, the more ready were firms to undertake R and D. Thus, if the market was growing faster, firms may prefer the import route to TC in order to cash in quickly on the buoyant situation.[18]

The tractor industry in India has attracted a good deal of attention because of the successful development of a totally indigenous tractor by Punjab Tractors (PTL). An analysis of PTL's story has been made, among others, by Laroia [1988] and Morehouse [1980], and makes very interesting reading. However, for the purpose of this survey, what is relevant is the conclusion that "...when the tractor industry was suddenly faced with competitive forces, there was a qualitative shift in their attitude towards R and D".[19] In this competitive situation, the technological strength of PTL was a positive factor in its success in tractors, and other companies were also induced to improve their engines and bring out new models.[20] When the initially designed PTL tractors (25 hp) proved to be uncompetitive in the market in 1973 owing to the presence of more powerful but only slightly more expensive tractors, PTL designed and produced a 35 hp tractor. Subsequently, it designed and manufactured a small tractor (20 hp) at a significantly lower price than available in the market.[21] Also, by the seventies, price competition had become very important in tractors, and those firms who had made suitable changes in their production technology, mainly towards designing low-cost machine tools, did relatively better.[22]

Textiles is another sector on which much research has been done. The organised cotton textile industry has operated under a severely constraining government policy, probably more so than for any other sector. This meant that the unorganised sector, particularly powerlooms, has been able to increase its share of total cloth production over time. According to Desai [1983], the weaving mills, whose capacity had been virtually frozen in order to protect the unorganised sector, responded to the competition from powerlooms by (a) increasing the capacity utilisation of looms by increasing third shift operation (b) weaving stronger and more durable cloth by increasing the number of picks per metre of cloth, and (c) processing (pre-shrinking, dyeing, printing) more of their own cloth. Firms which lagged behind in making these improvements and increasing product differentiation were driven into bankruptcy, and 112 were nationalised and put under the National Textile Corporation. Chandrashekhar's [1984] analysis goes a step further. He divides the mill weaving sector into two sub-sectors: (i) an oligopolistic segment with a limited number of firms catering to the sophisticated fabric market where product differentiation is the main form of rivalry and quality is at a premium. Competition between firms here necessitates a high rate of investment and TC, and their oligopolistic positions and growing market size allow the firms to do this and yet earn high profit margins; (ii) a non-oligopolistic segment involving the large majority of firms in the weaving sector, catering to less sophisticated and cheaper varieties of fabrics. The pace of TC is very slow because profit margins are limited and the market is stagnant or growing slowly. It is this segment that has been steadily losing ground to the decentralised sector.

Overall, there is a clear division between the efficient modern sector and the rest of the textile producers, and this has persisted over time at least partly because of government policy. The net result is that an industry which should have been at the forefront in international terms is now considered to be amongst the relatively backward even within India.

The automobile industry is another which is seen to have been constrained by government policies which treated it (particularly the passenger car segment) as a non-priority sector. A study by Gumaste [1988] finds little evidence of a relationship between the degree of competition (measured by an 'H' index)[23] and R and D intensity. Besides the fact that the index of competition used is incorrect, the paper does not mention the year for which the index is calculated. The deductions drawn are based on a cross-section picture of six sub-segments (scooters, mopeds, motorcycles, cars, heavy and light commercial vehicles), and the figures do not permit any conclusive inferences. A more fruitful procedure would have been to correlate the concentration ratios and R and D intensity in each sub-segment over time. In fact, a detailed study on commercial vehicles shows that the pace of introduction of new and improved products has increased significantly as the environment has become more competitive after 1983.[24]

Detailed micro studies such as the one by Mascarenhas [1982] bring out the complexity of factors involved in the technological

development of a company. Although Hindustan Machine Tools (HMT) has developed broad-based and impressive technological capabilities, its process technology has lagged behind. Initial technological capability in HMT came about because of the necessity to import substitute. But R and D came into its own only during the recessionary period of 1966, and was accompanied by aggressive marketing and a programme of diversification. The quality of HMT's top leaderships has been constantly emphasised as a positive factor in its development. However, both in Mascarenhas' study as well as in the HMT case study in Lall [1987], the influence (or lack of it) of other firms operating in the industry has not been adequately addressed.[25]

Another study of a public sector organisation is provided by Sengupta [1984]. Sengupta points to the slow pace of change in the technologies employed in the public sector steel plants, resulting in only a marginal decline in the specific energy consumption per tonne of saleable steel. He cites as reasons the non-professional attitude of government and the system of accountability in the public sector, as well as political factors. But this is not the whole story. There are also other issues such as the incentive to maximise production rather than productivity, which had an adverse effect on the nature of R and D undertaken. Moreover, the protection of the market coupled with the cost-plus pricing strategy has meant that all kinds of inefficiencies have been protected had have "...removed the elements of compulsion to innovate for higher productivity" (p 211). However, although it may well be true, this last inference is more in the nature of an assertion since it has not been substantiated. Working in the same protected environment, TISCO's technical performance has always been superior, despite very much older equipment than SAIL.[26] The difference lies not only in the fact that TISCO is a private organisation and suffers from far less political and bureaucratic interference, but also that "...technological effort is given a scope and freedom in TISCO which seems to be absent in SAIL".[27]

Bhagwati and Srinivasan [1975, chapter 15] provide a guarded assessment of the influence of what they call the QR (quantitative restriction) regime. They quote from in-depth studies by Frankena in support of the hypothesis that the QR regime produced incentives for a lag in adaptation to more efficient designs that clearly dominated the ones in use in India.[28] Examples are electric motors, distribution transformers and cotton textile machinery, where the productivity of the alternative technology was clearly superior. However, they caution that while strongly suggestive, these results cannot be taken as conclusive proof of their hypothesis since it may be that the costs of buying or copying the superior technologies may be greater than the gains from their adoption. They also say that an export-oriented strategy does not by itself increase the incentive to do R and D, but "...we can still argue ...that the general incentives to reduce costs and to maintain quality cannot but have been reduced by the sheltered markets provided by policies of automatic protection and strict control over domestic entry."[29] These conclusions were borne out later by Sanjaya Lall's work on leading Indian enterprises, as we shall see.

One of the key studies for our survey is the one by Ashok Desai [1984], which analyses the relationship between market structure and TC on the basis of statistical correlations as well as a series of case studies of different industries. He calculates Herfindahl indices of concentration for 42 industries based on CMIE[30] data for 1978-79, as also an 'E' index of inequality.[31] In most industries outside the vehicle sector, the H indices are low, the size distribution is highly skewed, and the number of firms are large ('long-tailed'). Where the number of firms was less than ten, the H index was above average whereas the E index was below average, implying that the size distribution of firms was less skewed in oligopolistic industries ('short-tailed'). Desai finds that in most of his short-tailed industries, such as explosives, mining machinery, metallurgical machinery, cement machinery, generators and commercial vehicles, the proportion of the sales of firms doing R and D to total sales of industry was high. By contrast, the proportion of firms doing R and D was lower and highly variable in long-tailed industries. Amongst firms that imported technology those doing R and D were larger than those that were not doing R and D, particularly in industries with greater product differentiation. Desai also found that firms importing technology were larger than those that did not, perhaps because technology suppliers prefer buyers who can command a large market. However, the market share of firms who obtained technology without importing it and without doing R and D was high. Desai concludes that "...whilst technology imports on their own tend to create oligopolistic market structures, R and D reinforced the competitive advantage of large firms. But the leakage of technology within the country had led to the emergence of many small firms, and they had appreciably increased their market shares in many differentiated large group industries."[32]

Sanjaya Lall's [1987] study analyses the process of acquisition of technological capability in 19 Indian enterprises[33] in detail. Besides looking at the influence of firm-specific factors, Lall highlights the role of government policy in the acquisition of different kinds of technological capability (project execution, product engineering, process engineering, industrial engineering and technology transfer). One of the important issues to which his study draws attention is the nature of the technological skills acquired by Indian enterprises amidst a protected environment. Under the existing regime, the leading Indian manufacturi enterprises have acquired diverse and de technological capabilities for designing a manufacturing capital goods, selecting a implementing foreign technologies, adapti and improving upon these over time, setti up supplier networks, transferring techn logy in the form of licensing turnkey plant joint ventures and technical assistanc However, the study feels that some of t capabilities were put to wasteful use, su as the need to adapt to the often inferior ra materials produced domestically; the regim (licensing, restriction of foreign competitio protection of public sector and small-sca industry, etc,) also detracted from enginee ing and managerial efforts to implemen even existing knowledge fully, and from e forts to constantly upgrade technologies i line with international standards. "Ther seems little doubt that a much greater ir flow of foreign product technology, in more liberal and outward-looking polic framework, *would have reaped a muc richer industrial harvest from the same se of capabilities*."[34]

That India has developed technologica capabilities that have been under-exploite at home could be a possible inference fron the fact that of the newly industrialisin countries it is a much better exporter o technology than of products.[35] While pro duct exports were frustrated by constraint on firms, by reliance on high cost inputs an general bureaucratic impediments, techno logy exports did not suffer from these. I fact, Rajiv Lall's [1986] study concludes tha one of the most important motivations fo foreign direct investment (one form o technology export) by Indian firms was th desire to avoid the effects of governmen policies that restricted their domestic growt and undermined their export competitive ness.[36]

Let us consider the market structure fo R and D activities. The government ha sought to promote technology directly wit the aid of science and technology policie such as fiscal concessions for in-hous R and D, licensing of all foreign collabora tion agreements alongwith restrictions o payments and terms of the contract and Foreign Exchange Regulation Act to contro direct foreign investment. The ICRIER NCAER technology project and als Sanjaya Lall's work[37] suggest that thes policies have restricted the supply o technology to India, particularly if we con sider the possibility that foreign firms woul supply a technology package commensurat with the terms offered by India. In som cases, the policies may have helped India firms to bargain for better prices.[3] However, it appears that the overall impac of technology import policies may have bee limited because most Indian firms in an case do not demand the complete know-wh of a technology (that would enable them t improve and even generate new technology on account of lack of market pressure.[39]

XIV

Sum-up of Indian Literature

To sum up the discussion on India, it was seen that there are two strands in the literature. One follows the econometric approach characteristic of writings on developed countries, but suffers from paucity of data as well as lack of attention to a large number of variables that can affect R and D behaviour. Besides, only a handful of studies have adopted this approach, and the results are not uniform. The only study among these (using industry-level data) which attempts to test for the influence of market structure finds a negative relationship between R and D intensity and concentration. Overall, it would be fair to say that the econometric approach to Schumpeterian analysis of R and D has not yet come of age in India.

It is not as if the case-study approach has been able to offer firm conclusions. Indeed, an inherent limitation is the inability to generalise from it. But its merit lies in its attempt to unravel the complexity of factors that lie behind technological behaviour, including basic determinants such as demand, the institutional structure, government policy, etc. In a highly interventionist economy like India's, government policy can play a key role in influencing R and D activity, and only case studies can capture the nuances and often contradictory effects of different policies.

There is a considerable amount of case-study literature on technological change in India, both published and unpublished. Given the focus of this survey, we have included only those studies which have a bearing on Schumpeterian hypotheses relating to firm size and market structure. There is no definitive conclusion with respect to the impact of firm size on R and D intensity or on the quantum of technology imports. However, there does appear to be a minimum scale for doing R and D for importing technology. The import content of technology collaborations decreases with the size of the firm, and larger firms also obtain a greater proportion of licences than other production know-how.[40] All this has led to the conclusion that as compared to small firms, large firms can exploit the results of R and D and of imported technology more fully. On the other hand, success of technology agreements was found to be unrelated to the size of the firm.

All the studies reviewed have pointed to the favourable impact of an intensification of competitive forces on technological activity. In some cases, such as machine tools in the 1960s and automobiles in the 1980s, the pressure was generated at least partly by the environment itself on account of recession on demand falling short of planned output. In tractors, Indian industry had become sufficiently mature by the seventies, and competition between the existing firms became more severe. By and large, however, it is government policy that has shaped the extent and nature of competition through licensing, import controls, etc. Amongst the sectors reviewed here, textiles and steel have been particularly subject to government controls, and these are seen to have perpetuated dualism in the case of textiles and created a lack of compulsion to innovate for higher productivity in the case of steel.

Desai's work has substantiated the role of competitive forces through a detailed statistical analysis. He finds that competitive pressure is greatest and technology search more active when there are a small number (between two and six) of roughly comparable size firms in an industry, which is supportive of the notion of a threshold environment as the most favourable for TC. According to this, market structures with either one firm or a large number of firms of different sizes will not be conducive to technical progress.

The protection given to domestic R and D activity and to the manufacturing sector has induced a high degree of technological capability. However, after a series of case studies S Lall has concluded that these capabilities have not been fully exploited because of the lack of compulsive competitive pressure and because of bureaucratic requirements and restrictions. Not only this, but much of the technological effort has been directed at complying with local-use regulations rather than focused on improvement of productivity. The case-study approach has therefore been able to address some fundamental questions regarding the basic determinants of technological activity. However, most of the conclusions that have been reached are somewhat tentative, and the more careful studies have emphasised this point. While more research is certainly required, it would help if future studies paid more attention to the need for giving firmer evidence (either qualitative or quantitative) to back up the arguments posed. This appears to be a lacuna in much of the case-study literature.

XV

Conclusions

The objective of this paper has been to provide a survey of the empirical literature on the Schumpeterian hypotheses relating R and D and innovation to firm size as well as market structure. This has been done for literature on developed countries and also on India. As far as the former is concerned, it was pointed out that the empirical studies had by and large failed to take into account Schumpeter's insights regarding rivalry and potential rivalry. Most of them have looked at the relationship between innovation, on the one hand, and firm size and concentration, on the other. The focus is thus on the role of present market structure variables. A few studies, however, have gone beyond this: the barriers to entry variable examines the possibilities of rivals entering the industry; the technological opportunity variable, while influencing entry conditions into the industry, also influences the rivals' entry decisions into research activity. One or two studies have even looked at direct rivalry in R and D activity, but this has excluded the possibility that future competition could emanate from firms not currently in the same industry. One possibility for future research is to take notice not only of research of rivals in the same industry, but also of those in technologically similar industries (e g, passenger cars and commercial vehicles).

In the Schumpeterian schema, short-term efficiency gains must be subordinated to long-term dynamic ones achieved via innovation. The real question concerns the kind of situation in which dynamic gains are at a maximum, for it is now accepted that some degree of trade-off will be required. In the 'traditional' empirical literature, the consensus is that there is a threshold concept of the most favourable environment for technological change. Large size and significant market power improve prospects for technical progress only up to a point, and only for innovations requiring a large and formal R and D programme (i e, normally at the stage where innovations are being developed for commercial use). Moderate to low entry barriers in such a situation will impart the necessary impetus to the bigger firms. Dominant firms, on finding their market position threatened, are likely to react most vigorously. The role of technological opportunity is extremely important in conditioning the relationships between R and D and the usual explanatory variables. In high opportunity industries, for example, the importance of monopolistic elements is much reduced.

New evidence on the Schumpeterian hypotheses has, however, cast a shadow on the received wisdom. In the true spirit of Schumpeter, both market structure and innovation must themselves be treated as being jointly determined by basic factors such as demand, technological opportunity and institutional structure. The results of the studies reviewed under 'new evidence' is at the moment tentative, but already an independent influence of market structure and firm size on innovation is now open to some doubt. For the same reasons, rivalry and potential rivalry may also not be an independent factor. Our criticism of the traditional literature for neglecting rivalry may thus turn out to be inapplicable to this new body of literature.

Literature on India that has implicitly or explicitly tested the Schumpeterian hypotheses can be divided into two streams. One approach has followed that of the traditional developed country literature, but generally suffers from a paucity of data and/or a lack of rigour. The other approach has a micro focus, and is based on case studies of firms and industries. In spirit, this approach is closer than the traditional developed country

literature to the more recent Schumpeterian approaches[41] since an attempt is made to analyse the role of basic determinants of technological change. Thus, the case studies on India have looked at the influence on technological change of government policy, demand conditions, the institutional structure, market structure, and also at the reverse influence of technology on market structure. Even the nature of technological change has been discussed and the influence on this of government policy and market structure been analysed.

The case studies point to the positive impact on R and D of intensification of competitive pressure. This is because Indian industry has been by and large highly protected, which means that although appropriating rewards from R and D was not difficult, there was no pressure to undertake technological change. By and large, government policy has been the key determinant of the degree of competitive pressure and therefore of the nature and extent of technological change. Many Indian firms appear to have accumulated in-depth technological capabilities as a result of the protective government policy, but these capabilities have remained under-exploited and the technological effort has often been directed at complying with local-use regulations rather than aimed at overall improvement of productivity.

Both the literature on India as well as on other developing countries[42] is contributing to a growing body of micro-economic evidence that is helping to gain a better understanding of the determinants of technological change. Even on a theoretical plane, the literature has tended to move from a macro to a micro approach. Moreover, "...the micro-economic description of technological behaviour is becoming both more realistic and complex. In a very particular sense we can say that we have now entered a pre-theoretical stage in which researchers are trying to develop new heuristics describing innovative behaviour before attempting further generalisations and model-building efforts."[43]

If an acceptable theory of technological change is developed some day in the future, the insights offered by the literature on developing country technological change will undoubtedly play a major part.

Notes

[The first part of this essay is a revised and updated version of Chapter One of my MPhil thesis submitted to the University of Oxford in April 1982. I am grateful to Vandana Verma for her suggestions].

1 For an amplification of this point, see Dasgupta (1986). Also see Reinganum (1984), where she points to the fact that different theoretical models of R and D have conflicting implications.
2 See also Kohn and Scott (1982) and Mukhopadhyay (1985a).
3 See Kamien and Schwartz (1975) and Scherer (1980).
4 In Section X, we shall see that Cohen et al (1987) criticise the literature for neglecting the distinction between firm size and business unit size.
5 See Kamien and Schwartz (1982), pp 98-100.
6 For example, US corporations with more than 5000 employees accounted for 53 per cent of manufacturing employment and 89 per cent of formal R and D expenditure in 1972; but if we consider in terms of R and D output, a very similar sample of firms accounting for 57 per cent of total sales received only 56 per cent of the patents issued in 1959 (Scherer 1980, p 418).
7 One study (Grabowski and Mueller 1978) however finds that higher concentration does increase rivalry in R and D within research-intensive industries.
8 The relevant rival was selected by best fit as either the industry leader in terms of volume of R and D expenditure, or the firm immediately preceding the firm in question in the R and D ranking.
9 This conclusion is supported in Terleckyj (1980) who found that when R and D is treated as capital more stable effects are obtained.
10 It is not as if the role of technological opportunity was neglected in all the earlier works (see Section VI).
11 See, for example, Fransman (1985), Kathuria (1987), and the book edited by Katz (1987).
12 See the article by Katz (1987).
13 If we use the earlier data set in Subrahmanian (1971a) and compute the elasticity of R and D with respect to sales, it turns out to be greater than one. If correct, this would contradict Subrahmanian's (1971a) conclusion.
14 We have seen, in Section III, that after a certain threshold size, research intensity appears to stay constant or declines.
15 He does employ a variable (skill-intensity) of technological complexity, using UK industry data. However, this is an inadequate indicator of technological opportunity, and the variable was found to be insignificant and was dropped from the regressions.
16 Katrak (1986).
17 For example, chemicals, petroleum and products, machinery and transport equipment are all within the high-technology group.
18 See Chapter IV of the NCAER (1971) study.

20 Desai (1984).
21 Morehouse (1980).
22 Desai (1984), Chaudhuri and Moulik (1986).
23 He defines the 'H' index as $n\sigma^2$ where n is the number of firms and σ^2 is the variance of the size distribution of firms. However, this is an inaccurate indicator of the degree of competition, since, if all the firms are of the same size, 'H' = 0. This would be true irrespective of the number of firms. The correct H (Herfindahl) indicator is $(n\sigma^2)$ + (1/n) (see Hay and Morris (1979), p 105). Now, if all the firms are of equal size, H = 1/n.
24 See Kathuria and Verma (1988).
25 Mehta's (1988) study brings out the fact that HMT competes with almost every firm in the organised sector, although it adds that HMT acts as a kind of pace-setter. Competition has increased since the late 1970s.

Innovative Marketing Strategies

Small Enterprises Fight Large Established Companies

S L Rao

A quick look at a variety of market segments in India shows that markets dominated at one time by subsidiaries and associates of world leaders have given significant shares to small enterprises that have adopted ingenious methods to enter the market and grow. There has been a flood of new entrepreneurs who have reached positions of eminence in the markets that they have entered. The examples discussed in this paper illustrate some of the reasons for the success of the small enterprises.

SMALL industry accounts for a substantial part of production and employment in developed as well as developing countries. In countries which have recently achieved high levels of income and employment like Italy, the underground economy, to a large extent comprising small industry, is said to be the driving force. In developing countries this is even more the case. For instance, in Peru, Hernando de Soto argues that the underground economy "embodies the entrepreneurial energy of ordinary people... It comprises thousands of craftsmen, storekeepers, truck and bus drivers, and food vendors whose operations would be perfectly legal in the US but whose governments force them to ply their trades illegally". He goes on to argue that "if this entrepreneurial spirit were legalised and nurtured rather than fettered and suppressed, a burst of competitive energy would be released".

A quick look at a variety of market segments in India shows that markets dominated at one time by subsidiaries and associates of world leaders have given significant shares to small enterprises that have adopted ingenious methods to enter the market and grow. The entrepreneurial spirit of innovation in product, process and procedures is alive and well in India. There has been a flood of new entrepreneurs who have reached positions of eminence in the markets that they have entered.

In industrial products, it has many times been due to their ability to find potential markets for products which were imported, find lacunae in the patent laws, locate a technology collaborator abroad, acquire licences, tie up large segments of the market, or find ways through the maze of facilities and incentives available to the small enterprises. This process is not as simple as it sounds. It calls for sustained effort and determination as well as high levels of organising capabilities. However, market demand exists, or is latent, and there is little competition, so that the effort is not so much to create a market and to succeed against formidable competition, but to get the necessary licences and permissions for planning and then organising production and finance.

The consumer product (including many consumer durables) markets have in recent years seen a revolution. Small and unknown manufacturers have come up from nowhere and undercut the market leaders in spectacular coups by attacking in ways and in places which others have not thought of, and which the new entrants have found the existing market leaders to be vulnerable in. In most of these cases, there was little initial investment in plant, machinery and buildings. However, there are many times, high levels of marketing investments, usually on advertising and promotion, many times on distribution, and sometimes on sales force.

It may not be a gross generalisation to say that almost every consumer product market today has powerful (sometimes dominant) leaders who were not visible a decade or so ago. There are markets in which a dominant (usually multinational) producer has been pushed far behind by these new entrants, who started small but achieved spectacular growth.

These successful small entrepreneurs appear to have some things in common:

(1) They have an understanding of the consumer and the market which enables them to identify a neglected market opportunity.

(2) They have an innovative approach to marketing which is not constrained by the 'book of rules' written by professors, market tradition, and experiences of other manufacturers.

(3) They have an ability to manage the environment of laws, rules, procedures, and the persistance to go on despite the hurdles thrown in their way by their formidable competitors as well as the constraints from the government.

The multinationals who have (mostly) lost out to these new entrants have done so for one or more of the following reasons:'

(a) A sense of complacency—"nobody can beat us".

(b) An increasing distance from the consumer and the market in the life-style of their executives resulting in their developing the lazy habits of picking products off the well-stocked shelves of the overseas principals/associates.

(c) Chief executives of the Indian companies who develop secretive habits of work, trying to keep themselves as buffers between the overseas companies and the Indian executives, this being reflected in an unwillingness to freely share information.

(d) A tendency to concentrate on the elitist ends of the market in which product attributes which are required in overseas developed markets were offered to the Indian customer, and the inability to re-design products and reduce costs in order to attract mass markets.

(e) A traditional approach to marketing—e g, that advertising should always follow distribution; that distribution should always be supervised by your own sales force; that you don't 'knock' competition; that you use exotic and 'sophisticated' models in advertising and keep away from 'ethnics'.

(f) A relative lack of local product information and product design.

(g) There were also for many years limitations imposed by government on capacity, location, licences for new products, limitations on leasing capacities or selling goods of other manufacturers, all of which forced them to limit their activities.

The examples given in the rest of this paper illustrate some of the reasons for the success of the small enterprises. They could help in understanding the different strategies of approaching customers and markets which have led to success.

Nirma and Detergent Market

This is a story that does not need much telling since it is so well known. Hindustan Lever started with a bar soap and a cake (Sunlight). They followed it with a soap powder (Rinso); and finally with a synthetic detergent powder (Surf). Others in the market followed Lever. Tata had 501 bar followed by 501 cake; 501 soap powder and then a detergent powder. Swastiks were the first—even before Surf—to come with a detergent powder but were soon overtaken by Surf.

Logically a bar soap cake should have been followed by a detergent cake and not a powder. This was especially so when soap powders never really took off in the Indian market. India has always been primarily a bar/cake market.

Further, thanks to Surf, all the other detergent powders, were 'sophisticated' in the sense that they were in heavy cardboard packing, very well printed and with powders which had a variety of ingredients to allow for optical whitening, high detergency, kindness to hands, etc. Lever started with large

pack sizes and others followed suit. Some ten years after the launch, Lever introduced polythene sachet bags to provide a low unit price small pack which was aimed as a penetration pack.

Over the years many small-scale manufacturers had started selling detergent powder in regional markets, taking advantage of the concessions available. The products were poorly presented, of low quality and generally unbranded.

In fact, of course, synthetic detergents in the Indian market, despite very high rates of growth, accounted only for a fraction of the total washing market. This was primarily because of price. As vegetable oil prices increased the price difference narrowed, but traditional vegetable soaps were still much cheaper.

Nirma saw this gap and seized it with a product that was harsh on hands and clothes and had cheaper packaging. Nirma also used the advantage of saving on the high excise duty by making it in a 'cottage' industry, without the use of power and thus heavily labour-oriented. Their unique features in relation to other similar manufacturers were: a distinctive brand name and identity, created and supported by highly professional advertising and a memorable jingle. They also did not set up their own sales force but built a loyal network of distributors around the country who earned higher margins than on Surf and other brands. In this way Nirma appealed to a whole new population for whom Surf was too expensive, and to many current users of detergent brands for whom Surf and other brands were 'too good' for use by domestic servants. Nirma therefore had an explosive growth and a generally explosive effect also on the total market. Nirma had 59.5 per cent of the powder market in 1988, versus 7.1 per cent for Surf. Nirma followed on this success with a Nirma detergent cake which now has 34.2 per cent of the market against the earlier very successful Rin (which now has 21.6 per cent).

Thus Nirma's innovation was in taking full advantage of the tax concessions and equally, if not more so in its approach of going after an existing mass market which had been ignored, with a product which satisfied the customer but did not give the customer attributes which added more to the price than to the utility that the customer got from them.

Balsara and Toothpaste Market

Balsara is a company which today has a turnover of around Rs 46 crore. It started as a manufacturer of products to control odour and then branched to hygiene and especially products to keep toilet bowls clean. These were small markets and Balsara remained a small company though it was the dominant one among the many other small manufacturers. It was the introduction of the toothpaste 'Promise' that marked Balsara's entry into the big league. The toothpaste market is estimated at around Rs 160 crore, and many multinationals are in this market, with 'Colgate' dominating the market, the others being Ciba, Levers, Geoffrey Manners and Beecham. Interestingly, none of the others has been able over many years to make a dent into the very large market shares consistently held over the years by Colgate. Both Levers and Ciba tried very hard. In the last 25 years Levers has had in this marked brands such as 'S R Gibbs', 'Pepsodent', 'Signal', and 'Close-up'. Of these, the first two have been withdrawn, and the latter two lead a tenuous existence. It could be questioned whether Levers even make money on their entries in the toothpaste market. Ciba which had a few years of success when Chlorophyll was in fashion, and pioneered the use of jingles on the radio through Radio Ceylon, has not been able to repeat that success subsequently.

Geoffrey Manners has had 'Forhans' as a specially positioned toothpaste ('for gums') in the market for many years and has consistently held on to its modest share. It is not an ambitious brand and has not made any waves in the market. Another multinational which is also in the market is Beechams with 'Macleans' toothpaste, again a very modest member of this large market. Hence Colgate has been an enormously profitable and successful company, thanks to its continuing dominance in the toothpaste market. Its vast resources enable advertising expenditures estimated at around Rs 5 crore in an year, and a superlative distribution network supported by a good salesforce. The product sets the taste and flavour preferences among customers. All attempts by the many other multinationals have failed in making a serious dent into their position.

It was this market that Balsara entered with 'Promise'. They have been very successful, being now No 2 in the market after Colgate, though far behind, with a 12 per cent market share versus the 15 per cent of Colgate.

What is it that enabled Balsara to succeed when so many larger and more experienced companies could not do so? Balsara went 'ethnic'. They recognised that cloves were the accepted remedy all over the sub-continent for problems to do with the gums, teeth, and mouth odour. They therefore launched a toothpaste whose major claim was that it contained clove oil. They also made sure that the base used for the product was satisfactory, as was the foam characteristic. They had the courage to invest in advertising, despite their small size as a company. While others tried to copy Colgate or to introduce product concepts picked up from their home markets in the US or elsewhere in the west, Balsara instead went 'native'. This succes has been sustained over the years.

Balsara are now trying to repeat this success with their new toothpaste 'Babool'. The product again claims to use an indigenous mouth cleanser as the flavour. It is also priced much lower than Colgate and has the appearance of Colgate in its carton and tube, to the extent that Colgate has filed a suit against them for copying. The tube is made unlike others, of a soft plastic. It may well be that this product will not have success of 'Promise' because it does precisely what 'Promise' so carefully avoided doing. It tries to imitate the leader and offers a similar product to Colgate at a cheaper price.

Balsara's is again a story of a small enterprise which bucked a trend and managed to succeed in the face of very strong competition from big manufacturers by recognising the new mood of the Indian customer to accept 'ethnic' flavours and tastes, and exploiting this gap in the market.

MTR Packet Foods

Packet foods have spread all over India and are even available in many stores in major cities in the US, Canada and UK. They include a variety of ready mixes—idli, vada, dosa, specialised 'ethnic' dishes, (Indian) sweet mixes of various kinds, sambhar mix, rasam mix, etc. The demand is growing, with an increasing number of urban households with both husband and wife at work, the lack of wide culinary knowledge and perhaps time and patience among many young housewives, space constraints in urban living affecting cooking possibilities, etc. For these families, while there are limits to the price they can pay, they will pay a price that has a reasonable equivalence to the fully homemade product. However the market size (which has to be estimated) is not vast and production techniques are on a small-scale, and labour intensive both in manufacturing and packing. These manufacturers have also taken advantage of the new, cheap, simple, and attractively printed packing material now available which ensure security from infestation of the contents, as well as attractiveness in display on the shop shelf. The small-scale enterprise has low overheads and is able to continue operating at low levels of production. Distribution is managed by using well located distributors who earn good margins and the typical manufacturer has no salesforce. The product seems to move largely by word of mouth and visibility. 'MTR' is the brand marketed by a well known restaurant in Bangalore, with a reputation for quality, cleanliness, purity of ingredients, and excellent taste. Other brands with a good share of this market are 'Gits', 'Orkay'. The packaging is in attractively printed paper and polylaminates enclosed in transparent polythene bags.

The success of these brands is in contrast to the failure of Hindustan Lever, a giant in the consumer products markets, with enormous experience around the world in precooked food products. Levers were the pioneers in introducing packet foods under the name of 'Hima' in the 1960s. The plant which was set up for dehydrating peas was used for the drying of various food mixes as well. Access to a first rate research centre enabled good quality product formulations which gave good results easily each time, and good taste. Expertise in developing packaging materials, developed over years in the marketing of soaps, toilet preparations and edible fats, was used to develop new laminates for packing. However flexible packing was in its infancy and many types of packaging films were not made in India or were in short supply. Distribution was no problem because of an established stockist net work. Experience in market research into consumer tastes, attitudes, and habits, was used in studying the potential consumer. The company had large resources earned elsewhere in the business, some of which could be used for investment in developing this new market.

In the event, by the early 1970s Levers had sold off the dehydrating plant and were out of the ready foods business. Many reasons can be attributed for the failure. There is no doubt that the market was too small for Levers and was going to take years to develop, though marketing investments could have developed the market much faster. The overheads allocated to this new business from the beginning were more than the sales could bear. The selling was handed over to high pressure salesmen whose experience was in selling talcum powders and toilet preparations. They overloaded the distribution system, resulting in damage to goods which many times reached the consumer with insects having got into the package. Flexible packaging was in its early days and low volumes meant high costs per packet.

It is clear that the small enterprise, which is willing to accept low volume and patiently to build the market over years, is better suited than a huge company for whom the market is too small, which has established procedures of allocating overheads, and which makes small volume products unviable from the outset. The question of viability of new businesses in large organisations creates serious problems for new products. This is especially so when the market has to be created, developed, and supported.

Rasna and Soft Drinks Market

The soft drinks market in India was in three categories for many years: carbonated beverages in many flavours packed in bottles with crown caps; squashes, and cordials; non-carbonated beverages and juices in bottles and cans. The first has been domianated by Parle and Pure Drinks; the second by the UB Group with products from Kissan, Herbertsons and Dippy; the third by Duke and now Parle and Lipton.

Of these three, the dominant and faster growing market was that for carbonated beverages, most of which are aimed at the youth market. The second was a relatively stable market with many small-scale producers taking advantage of local incentives; and the third was if anything, a declining market except in bottles, because of the very high cost of tins, the small-scale nature of the industry for whom it was reserved, and the poor technology.

About 10 years ago, the market was changed radically by three major developments: (1) the introduction of fruit juice and squash concentrates in bottles (2) introduction of powder concentrates in packets (3) introduction of tetra-packs for non-carbonated drinks and juices.

The first development was initiated by the existing manufacturers of squashes and cordials. After a brief initial success, it collapsed. The second was initiated by very small-scale manufacturers, the best known of whom was Rasna. The third development was initiated by Parle as a diversification from its interest in carbonated beverages, soon followed by Treetop, a Lipton product for whom this was a first foray into this market from concentration on hot beverages, i e, tea.

From the beginning, Rasna's target was extremely tightly focused on pre-teen children. The pack size, the unit price, the symbols and models used in advertising, all were aimed at this target. The product was made available in many flavours with frequent additions to the range. TV was used extensively from the outset, aimed at this target

group. The charming child model and the closing line 'I love you Rasna' pulled at the heart strings of parents, appealed to their emotion, and made them favourably disposed to the product. Children related to the model. The product itself was fairly ordinary and required the addition of sugar thus resulting in a reduction in the bulk of the package. Fortunately, the product introduction coincided with the easier availability of sugar in the market (after sugar decontrol) than in earlier years. The product was easily reconstituted and the cost to the consumer per glass was significantly lower than that for carbonated beverages, squashes or other drinks. This made it appealing to the parents as well. It has a good shelf life, does not occupy space in storage, and there is no worry about storing and disposing of empty bottles for which a desposit has to be given. Rasna got its distribution by creating a demand through advertising. Coming as it did in the early days of TV network advertising, Rasna was able to get wide coverage and reach at fairly low cost.

'Ju-cee'' and 'Tang' of Kothari General Foods (General Foods is a leading player in this business in the world) came some time after Rasna. While 'Ju-cee' entered with packaging and product similar to Rasna, their investment in advertising was low and they were unable to get the distribution and display of Rasna. 'Ju-cee' depended on Voltas for distribution and Voltas was unable to penetrate into the mass of outlets created and dominated by Rasna, and which it held on to through continuing heavy advertising.

'Tang' was a much superior product, based on imported ingredients. It was supplied in a bottle and the unit cost to the consumer was Rs 50. This immediately pushed it out of the reach of most consumers of Rasna and the different soft drinks. Even though distribution was reasonably good, the product did not have a chance to take off.

It can be seen from this example that Rasna built a market by focusing on the high investment and space required for bottles and cans; focused carefully on the target consumer; invested in advertising in a sequential way over the country to build distribution; and found effective packaging which would enable a unit price that would give it a mass market reaching down even to the lower middle class. Thus their approach to the mass market, and not using the 'Rule book' of marketing were their innovative approaches to marketing, as was their initiative (knowing the consumer and the market well enough) to enter with an appropriate product form at the right time.

Conclusion

The four illustrations in this paper are representative of many other such stories of small enterprises battling and winning in markets earlier dominated by very large, and many times, multinational enterprises. Thus, when IBM left India, International Computers was the logical successor. In the event, Hindustan Computers came in and achieved over Rs 100 crore turnover within 10 years, primarily through a demand creating strategy based on volume production, mass markets, and price cuts. More recently, Sterling Computers has gone one step further by offering good products at significantly lower prices than others, the lower prices being helped by volume, and by overhead reductions as, for example, by not having their own service networks. The Indian customer has little difficulty in findng local service groups at affordable prices and is interested in the lower prices which he gets from them. 'Good Knight' brought in the electrical mosquito destroyer from Japan into a market which had got a little fed up with the smoky coils and unpleasant ointments. They recognised that there was a large enough market of people with money for the initial high investment in the electronic device and thus pre-empted the giant Rallis who had both a coil and an ointment in the market for many years. Similarly, in recorded music HMV was beaten by small and local recorders of taped music, for example Sangeeta. Philips, the pre-eminent name in entertainment electronics, followed by Bush and Murphy, have been beaten in every segment of the market—whether radios, tape decks, speakers, black and white or colour television sets, and video cassette players and recorders. The leaders now were unknown around a decade ago—for example, Weston, Dyanora, Onida, Videocon, etc. In audio tapes, T-Series have come from nowhere to lead the market. Hero Bicycles who were a small-scale industry buying steel tubes from TI, have not only beaten TI who owned world famous brands like BSA, Hercules and Raleigh, but are now also making a determined bid to lead in the moped and motorcycle markets. Their strategy has been to offer superbly made products, at reasonable prices based on large volume and very tight cost controls. The largest tour operator in India is not Thomas Cook or Cox and Kings, but Raj Travels who pioneered Indian food and Indian guides, thus catering to the moneyed and conservative Gujarati, Marwari or South Indian traveller overseas. There are many other such examples.

Market dominance has in almost all instances resulted in complacency. These dominante manufacturers got too used to limited and highly protected markets. They looked for small volumes and high prices. They did little to create new demand and go after mass markets. They found it too easy to pick up products which were successful in other countries, and offered them with little modification to the Indian customer. On the other hand, the small new entrants had to find ways of going around these large manufacturers. They did so by knowing what the customer really wanted and designing products and strategies that gave the customer that, and in the process created mass markets, creating new demand, and many times leaving established and dominant manufacturers far behind.

Managing a Development Information System
Strategies and Methodologies

Kalyan Raipuria

This paper briefly introduces the concept of Development Information System and the system as it has evolved during the last forty years and as it is managed presently in India. The strategies and methodologies followed are briefly reviewed. The paper points to the major limitations of the system which remain in the light of the emerging information requirements. The problems and challenges are then briefly discussed. The paper, at the end, includes some reflections on future strategy and methodologies based on the review and concludes with certain issues related to DIS.

I
Introduction

THE building-up of a Development Information System (DIS) in a poor or developing country (DC) is indeed a difficult and long-term process. Several countries like India have had the experience of this for about 40 years. Several others have had much shorter experience. The problems and challenges these countries face are, however, general and common in developing strategies and methodologies. Thus a study of India in some detail may be useful not only for our own better management but also of relevance to other countries.

The present paper proposes to briefly deal with the conceptual and operational framework of DIS and introduce the DIS in India (Section II); provide a review of the strategy and methodologies of DIS in India (Section III); discuss certain limitations, problems and challenges arising from the Indian experience, some of which may be common to most DCs (Section IV); and make some reflections on future strategy and methodologies (Section V).

II
Conceptual Framework

A DIS may be understood as an integrated, comprehensive, regular, predictive, and widely usable arrangement calibrated to meet the information needs of development strategy formulation, implementation and review, covering major indicators of the economic and social conditions of people at large. Of course, the specifics of information needs would be determined by the stated objectives of development in the country and the way these are sought to be achieved through planning, or market mechanism, or a mix of both. The needs would also be determined by the current stage of development and the size of the country, indicated by population, land mass and GDP, among others. Their international dimension would be determined by the degree of the economic openness.

The DIS would have both organised and unorganised sectors given the case of a DC. It would also have the government/public sector components and the rest of it which may mean non-governmental organisations (NGOs), and private sector, including the academic and research institutions. It would also have both domestic and international facets. Of course, it would have several subject/sectoral (agriculture, industry, trade, etc) sub-systems. Its functional sub-systems may relate to policy and planning, designing, collection, processing, storage and retrieval, translation, analysis, research and development, cadre and training of personnel, dissemination and publication, which may often be common to sectoral sub-systems.

Information in the above context should be understood in its broad sense, much broader than statistics, defined as structured data, qualitative and quantitative, based on definite framework/modelling in the light of set objectives, so as to increase the level of knowledge, and planning, policy and decision-making capacity, and finally productivity and efficiency. That is, information which is processed and which has input value, has the desired impact, and helps in achievement of the user's objectives, rather than resulting in atrophy.

Developing of DIS may be taken to mean expanding base, widening coverage, standardising the classifications and concepts, maximising utility, exercising cost-effectiveness, as also increasing adaptability to the emerging needs.

The review of a DIS is meaningful only if it is made in the light of the widely felt needs of (a) informed planning, policy formulation, and decision-making for pursuing a development strategy; (b) monitoring, and evaluation of development schemes; (c) intelligence for developing mitigation strategies for the observed problems; (d) better co-ordination within the government as also between government business and industry; (e) increasing feedback from the public at large about development performance; and (f) maintaining appropriate relations with different countries.

Such a review is crucial in formulating strategy and designing and implementing methodologies of a DIS in future.

DIS in India

The DIS in India, in the present state, has evolved in the context of the country's development planning initiated in 1951. Before independence in 1947, collection of information/statistics related to law and order, revenue and trade which provided a picture of the export of raw materials from the colony and import of manufactures from Britain. This was, of course, to give way to a development-oriented system after independence. The country has had about 40 years of independence and a little less of planning. The basic socio-economic objectives guiding these plans have been higher growth, self-reliance, greater employment, poverty removal, redistribution and social justice, backward area development, and development of modern agriculture and industry. Recently, there has been emphasis on cost reduction, higher productivity, efficiency, technological upgradation, and international competitiveness.

The DIS in India is tuned to (i) the mixed-economy system in which public sector has a crucial role in production and capital formation processes controlling core sectors; (ii) the domestic economy, being a large country reflected in limited economic openness; and (iii) mostly centralised planning, policy formulation and decision-making.

The present paper, while reviewing, *stylises the DIS* on the basis of the observed characteristics brought out in Annexure I in terms of national policy, strategy and existing organisations. What is attained in operation may not strictly stand to the test of a 'system'[1] in its horizontal or vertical sense.

There is the Central Statistical Organisation (CSO) set up in 1951, directly responsible for co-ordination and development of statistics, and the National Sample Survey Organisation (NSSO) set up in 1958 for major surveys, but there are also other organisations involved in information processes. The major information sources are the government departments of the central government, but there are important sources of information at the state and local levels looked after by the State Statistical Bureaus (SSBs)/Directorates of Economics and Statistics (DESs). There are about 130 different organisations at the centre, aside from CSO, employing over 10,000 statistical workers, aiming at collection of information, co-ordination, surveys, research and

analysis, etc, contributing to the DIS. There are over 400 statistical offices/units in the states. There is National Informatic Centre (NIC) set up in 1975 for developing infor mation technologies and country-wide computer support though several organisations have their own computer systems as well [NIC, 1987].

Perhaps, a fully centralised and a well-integrated comprehensive information system* remains an ideal for most of the countries and India is not an exception. Information is considered power, and the organisations of source part with this power with difficulty making co-ordination difficult. In a DC like India there also remain problems of limited resources and complimentary infrastructure. The following sections present a review of DIS in India.

III

Review of Strategy and Methodologies

The major characteristics of the Indian DIS, as brought out in Annexure 1, show that

(i) India has a well determined national policy and strategy of DIS in the country;
(ii) The overall authority and co-ordination is vested in suitable central ministry;
(iii) There are a number of central/national implementing/co-ordinating organisations in regard to (a) collection and co-ordination of statistics (mainly CSO); (b) surveys and census (NSSO and RG); (c) informatic development (NIC); (d) collecting and analysing information for planning and policy formulation (e g, Planning Commission, directorate of economics and statistics of ministry of agriculture, and economic divisions of other ministries; (e) monitoring of large development projects (programme implementation ministry); (f) evaluation of development programmes (Programme Evaluation Organisation, PEO); and (g) commercial intelligence (DGCI and S);
(iv) There are regular and special set-ups and panels for consideration of deficiencies and improvement of the DIS;
(v) The annual budget and the plan provisions are made, though marginal[2] in relation to total provisions (and insignificant in relation to GNP); the provisions for statistics and NIC are made separately;
(vi) There is a central cadre, arrangement for training and development, standardisation and quality control;
(vii) There are a number of scientific societies and associations set up to help improvement in DIS;
(viii) India has attempted close and active co-operation with the international agencies involved in information development and harmonisation;
(ix) There are specific news outlets for developments in the system and new surveys conducted from time to time; and
(x) There is a system of annual, medium-term and five-yearly appraisal of progress of DIS which is also published.

Strategy and Methodologies

From the very beginning, the strategy of building up the DIS in India has been to expand the statistical base, with the constraint of given resources, to build up the necessary organisations and institutions; to systematise and standardise the collection, processing and presentation; to identify the gaps and operate the fill-in action plans, all in the light of planning and policy needs; to develop the system using modern information technology, keeping in view the socio-economic constraints; and to disseminate the maximum information for use as far as it can be made public.

The methodologies included (i) centralisation of the system; (ii) standardising the concepts, methods, and systems of presentation; (iii) building up of a well-trained cadre (Indian Statistical Service) and supporting personnel at different levels; (iv) selection of scientific techniques (e g, census/sample) according to the nature of source and objective; (v) updating the base of indices of development information to account for the current conditions, and (vi) using the latest available information technologies.

The progress of strategy and methodologies of the DIS, according to our review, has been remarkably successful considering the development stage indicated by low per capita income (estimated at $ 290, current prices for 1986/87); and large size of the country, population, polity and scale of gross domestic product and large number of producing units.[3] The DIS concerning the external sector has also been growing well considering relatively small economic openness of the country, indicated by the share of exports and imports of Gross domestic product (7 per cent and 10 per cent, respectively, in 1985, covering goods and services).

The standardisation of data base of major indicators at national as well as state level has been possible. The industrial, trade and custom statistics classifications have been brought in harmony with the international classifications. The national accounting is also in line with the UN system. Input-output formulation is in standard (Leontief's open static model) format. Thus the statistical base is fairly developed and is on standard international lines. This is mainly because of the crucial role played by the public sector in GDP (one-fourth of total), manufacturing (one-fifth), investment (about half), and foreign trade (about one-fourth), the sector in which collection of information is administratively easy and speedy for the government.

Major Sub-Systems

The major subject sub-systems of the DIS which have evolved over time include macro-level as well as sectoral, and those relating to basic socio-economic development characteristics. The coverage of the DIS is comprehensive particularly in regard to the demographic aspect; macro-economic aggregates like national income, value added, savings, investment and private consumption expenditure; sectoral (agricultural and industrial) output and value added; prices (consumer/wholesale); employment; levels and components of money and credit, banking, foreign trade and balance of payments; and science and technology (S and T).

The census of population conducted every decade (latest, the 12th, in 1981) is one of the largest and most comprehensive information system in the world now covering about 800 million persons. India prepared and published its first national income series as early as in 1954, revised in 1967, 1978 and 1983. In view of the improvement of more and more information about unorganised sector,[4] economic census (by CSO in 1977 and 1980 with follow-up surveys beginning 1983/84) has become part and parcel of the DIS in India. Considering the objective of poverty removal, redistribution and social justice, it is necessary that micro-level detailed information is available on consumption, savings, capital formation, employment, etc. For this purpose, rounds of surveys (by NSSO) are conducted to provide the required data particularly for central planning. An important set of information is collected on different programmes and schemes under implementation which are part of the five-year plans. Among these, there has been recently a comprehensive collection of data on the poverty removal, rural development and employment programmes. With increasing emphasis on modernisation, S and T and scientific use of natural resources, there is increasing focus on building up S and T and natural resources information systems. The National Information System for Science and Technology (NISSAT, set up in 1977) presently runs specific sectoral information centres, e g, for leather, food, machine tools, drugs and pharmaceuticals. A commercial based Technology Development and Information Company of India (TDICI) is being set up to finance the projects and provide technology information.

Planning and DIS

It has been observed that "the primary function of planning in a free society is to increase the flow of information thus correcting the imperfect 'anatomy of market failures'" [Rodan, 1963]. Given the imperfections of markets as also the inadequacies of economic mechanisms in a developing country like India, central planning adopted in the country was expected to result in an appropriate availability of information

covering all segments of social and economic life, for planning, decision-making as well as public participation. The planning process has, indeed, been successfully feeding back the requirements of DIS to the whole administrative system in this regard. The steering groups, task forces and working groups and other panels appointed in the process [list in Alagh, 1975] and the commissions/committees set up on specific issues have been instrumental in generating substantial information. As a result, plan after plan, the number of institutions and areas covered for information have grown resulting in data base improvement.

India has a long history of plan modelling particularly at the central level. The current generation of plan models established since 1972 explicitly provide dimensional hypotheses and magnitudes of sectoral outputs to achieve the targeted growth and redistribution. The recent 'add-ons' [Alagh, Kashyap and Murthy, 1984] include submodels of agriculture and industrial sectors, poverty, consumption, foreign trade, financial resources, demography and employment [PC 1986]. There have been some attempts to formulate policy models in regard to prices, employment, savings, etc, but are yet to be formally integrated with the plan modelling system. The modelling activity generated demand for a variety of information, relating to macro-economic aggregate, society's consumption, employment, input-output transactions, farm related aspects, distribution of income and wealth, and above all demography.

The present model related information system (MODRIS) is described in the table. Most of such information is highly processed and detailed, of considerable research value, aside from use in planning and policy formulation. India is one of the few DCs having prepared detailed input-output transactions tables (I-OTT, covering coefficient and associated product-mix, market-share-main/other products, absorption and make-matric) presently available for 1973-74 [CSO, 1981], while that for 1978-79 and 1983-84 are under preparation. These tables based on extensive data base provide an integrated quantitative picture of the whole economy. The available I-OTT provides 115 × 115 sector matrix compared to 30 × 30 sector matrix I-OTT prepared for 1960-61 [PC, 1974].

Towards Computer-Based DIS

In view of large scale of DIS sub-systems in India, many of the concerned departments have set up their computer systems at varying scales. The major organisations include Planning Commission, department of statistics and registrar general's office. National Information Centre (NIC) was set up in March 1975 by the government under the department of electronics, presently under Ministry of planning, to promote computer-based information system in the country.

During the last thirteen years, NIC have made considerable progress [NIC, 1987]. NIC have the large frame computer (CDC Cyber 170/730) installed at headquarters (HQ) in Delhi. About 20 mini computer terminals have been provided to 59 government ministries/departments in Delhi. These departments have compatible computer systems (200 PC/AT and PC/XT) connected to the NIC Cyber System to form its network, NICNET. The sub-systems in the computer system can be assessed on-line from these terminals by the departments. Aside from this service, NIC helps the departments find solutions to the problems related to further development of information system.

NIC is presently attempting to extend the NICNET to cover the 23 state capitals as well as 438 districts (DIS-NIC) in the country to help improve planning and monitoring of development schemes, and finally develop a quick system of information linking them to the centre. The plan to evolve a comprehensive computer network is part of the Seventh Plan, 1985-90. For this purpose, 4 super computers (NEC S-1000) have been installed at four places (including HQ) in the country. At second level, super mini computer (ND-550) systems will be installed i[n] all the state capitals. They are expected t[o] act as information bridges between th[e] district systems and the central system. Th[e] district systems, as a part of DISNIC, wil[l] have Super AT-System for providing service[s] and covering information on monitorin[g] schemes and other socio-economic dat[a] required in planning and decision-making. The NICNET is aimed to use satellite communications for connecting the districts o[f] the state systems to the regional systems. The Mother Earth Station is to be installed in Delhi with Micro Earth Stations in state capitals and districts. INTELSAT-V/INSAT I-C will provide the communication link [NIC, 1987].

NIC has developed a large pool of highly trained and experienced personnel covering 800 computer professionals. Furthermore, more than 3,000 officers and staff people belonging to other departments have been trained to move to computer-based DIS [NIC, 1987]. The projected requirements are, however, substantially large corresponding to the computer development programmes under the Seventh Plan.[5]

Table: Model-Related Information System (MORDIS) in India

Model/Sub-Model	Information Base	Methodology Involved
A Core Models:		
(i) Macro-Economic Model	National Accounts Statistics (CSO)	UN National Accounts and Harrod-Domar Macro Growth Model
(ii) Input-output Model	Input-output Transactions Table, 115×115 sectors, for 1973-74 of CSO, updated and revised, at 1984-85 prices.	Open Leontief's Input-Output Model
(iii) Investment Planning Model	Capital flow matrix for all 11 national income sub-groups.	Estimating parameters relating to investment and output (time series) for major sectors.
B Sub-Models:		
(i) Agriculture	Region or location-based estimates of output, demand and inputs to examine feasibility of target based on A(ii).	Relationships between area and production
(ii) Industry	Material balances (Production, exports, imports/change in stocks) to check feasibility of targets of industries based on A(ii).	Material balance approach on selective industries.
(iii) Consumption	Demand forecasts for different goods and service considering likely change in distribution of income.	LES consumption functions—time series and cross-section.
(iv) Poverty	Estimates of people crossing the specified line during the Plan and corresponding consumption requirements.	Income distribution function and cross-section analysis.
(v) Exports-Imports	Projections of exports and imports for major products/product groups.	Simulations of parameters based on econometric methods
(vi) Financial Resources	Estimates of financial resources available to support investment.	Times series and cross-section econometrics.
(vii) Demography and Employment	Analysis and projections of population, labour force and employment	Life tables for males and females, survival ratios, growth parameters and rural-urban distribution

THE EAST INDIA HOTELS LIMITED

4 MANGOE LANE CALCUTTA 700 001

FORM II A

NOTICE

It is hereby notified for the information of the Public that The East India Hotels Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under.

1. Name and address of the applicant : THE EAST INDIA HOTELS LIMITED
4 Mangoe Lane, Calcutta 700 001

2. Capital structure of the applicant organisation :

		Rupees
Authorised		
1,00,000	11% Cumulative Preference Shares of Rs. 100 each	1,00,00,000
25,000	9.5% Redeemable Cumulative Preference Shares of Rs. 100 each	25,00,000
1,00,000	9.5% 'A' Redeemable Cumulative Preference Shares of Rs. 100 each	1,00,00,000
75,000	11% 'B' Redeemable Cumulative Preference Shares of Rs. 100 each	75,00,000
2,70,00,000	Equity Shares of Rs. 10 each	27,00,00,000
		30,00,00,000
Issued, Subscribed, Called & Paid Up		
83,155	11% Cumulative Preference Shares of Rs.100 each, fully paid up	83,15,500
75,000	11% 'B' Redeemable Cumulative Preference Shares of Rs. 100 each, fully paid up	75,00,000
2,36,03,520	Equity Shares of Rs. 10 each, fully paid up	23,60,35,200
		25,18,50,700

3. Management structure of the applicant organisation indicating the names of the Directors, including managing/wholetime Directors and Managers, if any. : The Company is managed by its Managing Director under the superintendence control and direction of its Board of Directors. Names of the Directors are:

Rai Bahadur M.S. Oberoi — Chairman
Mr. P.R.S. Oberoi — Vice Chairman/Managing Director
Mr. S.M. Dahanukar
Mr. L.K. Panday
Mr. B.M. Gogte
Mr. G.K. Khanna
Mr. S.C. Chatterjee
Mr. Raghu Raj
Field Marshal Sam Manekshaw
Mr. B.K. Nehru

4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division : The proposal relates to the establishment of a new undertaking by incorporation of a new Company for contract and project management consultancy services.

5. Location of the new undertaking/unit/division : Registered Office of the Company will be located at West Bengal.

6. Capital structure of the proposed undertaking : Authorised Capital Rs. 1,25,00,000

7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate: :
   (i) Names of goods/articles : NA
   (ii) Proposed licensed capacity : NA
   (iii) Estimated annual turnover : NA

8. In case the proposal relates to the provision of any services, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Ranging from Rs. 25 lakhs to Rs. 175 lakhs during the first five years.

9. Cost of project : There is no project cost as such. However, the company will acquire office accommodation and the necessary office equipment as and when required.

10. Scheme of finance, indicating the amounts to be raised from each source : Acquisition of office accommodation and the necessary office equipment and working capital margin money requirement will be met out of issued capital.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, Dr. Rajendra Prasad Road, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

For THE EAST INDIA HOTELS LIMITED

Dated this 14th day of August, 1989

P.R.S. OBEROI
Vice Chairman/Managing Director

Pressman

NIC Services

Presently, NIC's services [NIC, 1987] cover a large number of subject areas entailing information systems. Their number varies according to the ministry/department concerned. The areas/subjects are over 40 in ministry of finance covering revenue, expenditure and economic affairs departments. On an average, the number of areas/subjects covered by the information systems in the department is 5 to 10, but would soon extend with development to NICNET. A number of common information systems for departments of the centre have been developed by the NIC. They include, *inter alia*, action plan monitoring, file movement, reference monitoring, and public grievances monitoring. Information on feedback on adequacy and efficiency of services is, however, not available to make any evaluation.

NIC services include systems software support to all computer systems of NICNET, and R and D support for designing and developing distributed data-based management systems (DDMS), automatic data-based design tools (ADDT), and communication protocol (CP). NIC also has the mathematical modelling support (MMS) service system and has helped several big projects, in optimisation in case of Vizag Refinery, in energy planning by Planning Commission, in integrated development model for public sector joint plant committee in the steel sector, in projecting demand for fertilisers aside from help in construction of 19 stadia for Asiad held in 1982 with 35 terminals, and in information dissemination during the non-aligned summit in 1983. There are provisions for software development programme (CAP, CAM, CAI, etc), computer development, training, and R and D. There is plan for National Centre for Software Development and Computing Techniques. These are aimed to take maximum advantage of emerging information technologies.

IV

Limitations, Problems and Challenges

Of course, in the process, a number of limitations of DIS in India have come to surface, some of which have been examined and corrected under a system of directing and reviewing improvement of data base looked after by a standing committee in the government. Major limitations pointed out by our review include the following:

—Despite large development of the DIS over the period, there remain *important gaps*, notably in respect of large "unrecorded production" [CSO, 1988] and substantial unaccounted income;[6]

—In estimation of basic growth indicators like GDP, savings and capital formation, despite a revision procedure in progress, there remain data gaps indicated by the significant extent to which *indirect current data* are used notably on agriculture and small-scale manufacturing, extent differing among outputs and inputs [Chakravarty and Raghavan, 1985];

—Information for the *multi-level planning and decision-making*, i e, space-specific or regional information has several missing links [Alagh, Kashyap and Murthy, 1984];

—There have been attempts to *standardise* the concepts and methods of measurement, relating to national and state domestic product, but there remain problems of comparability among them and comparability with other countries, aside from problems of continuing improvements and methodology constraining comparison over period and different series of estimates [CSO, 1987b and 1988];

—Though the *economic indices* (consumer price index, CPI, latest base 1984-85; industrial production index, 1980-81; and foreign trade index, 1978-79) have been up-dated in respect of their base from time to time, there remain problems of continuing up-dating, suitability to economic analysis, statistical consistency, i e, comparability with earlier indices, and, above all, appropriateness of indicators for serving the main purpose, e g, in CPI [Minhas, 1987 a and b];[7]

—The *forecasting system* remains weak[8] in respect of important indicators of aggregative, particularly of disaggregative nature, like those in advanced countries, due to inapplicable theories and "dearth of relevant economic information" [Roychoudhury and Mukherjee, 1984], as also due to difficulties of analysis of economic behaviour given the uncertainties and continuing certain characteristics of a developing country;

—Wide *dissemination* of information requires expansion of infrastructure; it is presently constrained by the inadequacy of publication, translation and communication sub-systems;

—*Analytical sub-system* of the DIS has scope for enlargement and improvement, given the large amount of data collected, which sometimes remain untabulated and inaccessible/hidden [Ghosh, 1987][9] due to shortage of handling resources, leading to inoptimal use of high-cost information [Chakravarty and Raghavan, 1985];

—With the enlargement of economic activities, the CSO has found itself *weak in co-ordination*, the main reason being that it "has not been specifically empowered to undertake the function of co-ordination through executive or statutory orders" [Chakravarty and Raghavan, 1985], and that it has not been given due *priority and status* [Seal, 1987];

—The information collected in certain areas and by certain organisations has been found lacking in respect of even simple *analytical and quantitative framework/model* to be useful in policy formulation; they include public finance/budgetary data, price data, credit data, savings, and investment data. Policy advice in important areas, "is not really dervied from any rigorous professional work", and is formulated on the basis of "meagre data", though they are being collected [Krishna, 1974];

—Information system in regard to *evaluation* (mostly ex-post) of development activities is beset with limitations of certain statistical 'biases' (arising due to design not using both 'control', and 'treatment' groups but only the later), time consuming process of analysis of qualitative data, and inadequate sample size [Seal, 1988].

Some of the above limitations, responsible for imperfect planning and targeting, may be overcome as a result of a number of sample surveys and economic census which the department of statistics may undertake in the coming years. The process is, however, going to be long considering the required large scale of necessary system and constraints usual to a DC, notably availability of funds.

The limitations of the DIS in regard to efficient storage and retrieval, computation and transmission, and consistency and integration are related to the speed of adaptation of available technologies in the area of informatics, computer hardware and software, telecommunication, and printing. Such adaptation has much to do with the availability of resources rather than strategy of DIS, and is not easy given political realities.[10]

Major Problems and Challenges

Among the major *problems* of building up the DIS in India, some are common to developing countries, while some others are specific arising out of large size of the country, the population, and the polity. As for the former, the basic is that of limited resources which gives origin to limitations of rapid up-dating of crucial indices, timely collection and tabulation/processing of certain information, wider dissemination and adequate complementary functional sub-systems. Yet another problem common to the developing countries, relates to economic structure which is characterised by large unorganised/unaccounted economy, and uncertainties particularly in respect of agricultural production and foreign transactions, constraining the estimation and forecasting of macro and sectoral economic aggregates.

Recently, India has moved to the computer-aided DIS, but the problems of adequate development of hardware (HW), software (SW), and orgware (ORW) are being faced, reflected in the gaps observed in respect of the DIS. Of particular importance are the necessary number[11] of 'material balances', timely input-output transactions table, reliable employment and capital coefficient matrix, and other parametric estimates, e g, foreign trade elasticities, so necessary for planning and targeting. It is important that similar information is developed at regional/state level. It has also been observed that weak *cybernetics* is reflected in inadequate information feedback in planning and policy-making [Joshi, 1979, and Mozoomdar, et al, 1979]. These problems also come in the way of efficient crisis-management whether faced with natural calamities or crisis arising out of international factors beyond a country's control like the oil crisis, given the lack of

he required data calibration. In fact, the roblems of resources, inadequate DIS infrastructure, not-so-efficient data calibration nd weak cybernetics are all interrelated.

Recently, in the face of rapid development f information technologies, new problems ave arisen relating to (a) information insecurity, (b) distortion in planning and esigning for DIS given large manpower with low skills, accompanied by brain drain f the most skilled manpower, and (c) mismatch of HW, SW and ORW. These problems are, however, not insurmountable, iven a dynamic policy-making process and ncreased co-operation with other countries.

Technically, a problem which is faced is he acceptability and credibility of information. These problems are of two kinds. Firsty, those problems arising out of (a) outlated and inadequate data base, (b) qualiative or soft data, and (c) deficiencies of real system' and 'simulation' data. They call for setting-up suitable norms of experimenation techniques, specification and validaion (replicative and productive) especially relating to model data [Oren, 1981].

The external sector information subsystem is particularly beset with problems insofar as the national DIS is not externally-hooked as in advanced countries and the certain outward and newly industrialised countries. India's economic openness has recently increased, so also the interest and appetite for external information. Certain steps have been taken to improve the external sector data base. However, there remains scope for further improvement in trade information system [Panchamukhi, 1982], particularly in respect of increasing the timeliness of DGCIS foreign trade data reporting, strengthening of forecasting/targeting, increasing availability of international prices and financial information with alacrity, and exploiting the full potential of 66 Trade Missions for commercial intelligence and assistance in policy-making and in merchandising.

The major *challenges* of the DIS, as we see, are resource mobilisation and allocation corresponding to emerging needs which can materialise if cost-benefit (C-B) analysis[12] is applied in this area; raising the status of DIS organisations and personnel; co-operation with other countries in respect of information flow; and bridging the gaps, systemic and analytical, in the DIS. To overcome the limitations and implement various improvements, observes an experienced data manager in government, "a several-fold increase in the financial outlay for statistical and other related schemes will surely be one of the basic pre-requisites" [Seal, 1987].

Given the centralised and 'top-down' system of information and research flow to the developing countries, there is need for 'distributed information and research system' (DIRS) at the international level [Raipuria, 1985].

V

Some Reflections

In what follows, some reflections on future strategy and methodologies are brought out based on the above review. Many of these are not exceptional to India. They may have some significant bearing on future strategies and methodologies in the face of increasing information requirements in future:

—Due priority need to be assigned to DIS considering the significance of information for planning, policy formulation and decision-making; the *allocations*, though increased in the current annual plan and budget over those of the Seventh Plan, need to be further favourably reviewed in the light of the priority, raising to 0.5 per cent of the total expenditure;

—There is need for increasing realisation by the decision-makers and others that *sharing of information* is of long-run use for everybody. Though 'information is power', sharing of this power, unlike other powers, overcompensates the loss which is felt in sharing information, by way of feedback;

—Considering the need for a comprehensive and integrated DIS, of increased utility to the decision-makers and public at large, there is a need for building-up a *register of all development activities* enumerating the area, objective, expenditure, targets, information available and what is needed, etc, towards building-up system-based information and informatics corresponding to these activities and their significance. This would help avoid repetition of information by different organisations as now on prices, macro aggregates, production, trade, etc;

—Given constraint on resources, a developing country often may have to supplement the government information system by *promoting private entrepreneurs, institutions* and *organisations* to build up their information systems;

—To overcome the time lag in availability of information sometime going beyond 2-3 years as in the case of industry (Annual Survey of Industries), foreign trade (DGCI and S), and other data; as also gaps in official information, such as unofficial prices of goods and services, a sub-system of *development intelligence* need to be developed to enable quick assessment of impact of plan programmes and policies; to give early signals for correction and above all to truncate the areas of unofficial/unaccounted/concealed activities. This should be open and much larger in scope than Economic Intelligence Bureau of the ministry of finance, set up in 1985;

—Proper specification of DIS calls for an *analytical framework/model* of the interrelated sectors and policies, and development of weekly, monthly, quarterly and yearly national indicators; this is an imperative to prevent atrophy in the system and what is known as Finagles Law of Information;[13]

—An internal system of *forecasting* of major national indicators based on clearly stated assumptions and comprehensive but tightly integrated data base need to be developed, over period, aiming *at least* three-fourth of the forecasts with error of only "marginal type (if not 'insignificant') over a plan period in aid of better formulation of targets and corrective action plans. Similar attempts need to be made at regional/state level in course of time;

Such efforts may be feasible and more meaningful if information base for micro-level forecasting can be tightened up, 'lead-lag' relationship can be increasingly researched, problems and multiple causality can be gone into, and a certain 'interplay,[14] of available official five-year plan) and unofficial models can be attempted;

—There is scope for improving *public awareness* and understanding and shedding the biases against information and computers, the latter often reflected in mis-specified 'garbage-in and garbage-out' (GIGO) syndrome,[15] and the former reflected in the proverbial notion "lies, damn lies and statistics"; this calls for strengthening of the dissemination and publication sub-system;

—Constructive attempts need to be made to *take* the information collected by government *out* to the maximum. There is scope to give up the "voodoo of secrecy" in regard to facts [Ghosh, 1987]; this would help develop the information itself and increase public awareness, wider participation and feedback;

—While *self-reliance* of DIS is objective in regard to HW, SW and ORW, it is important that cordial international relations are exploited for co-operation in development and security of information; and

—Maximum use need to be made of appropriate *information technologies* in further building up the DIS. These are very expensive for a DC like India but selected use on the basis of suggested C-B analysis should be promoted. In case of external sector, such usage may be an imperative to increase international competitiveness. To the extent such technology, e g, tele-linking, teletexting, tele-conferencing[16] help to exploit the manpower resource located in the country's own missions abroad, real benefits may be considerably larger compared to the cost. Simultaneously, the increasing capability of interpretation and analysis should be developed, to maximise the use of information towards planning, policy formulation and decision-making.

The above reflections are general and, by no means, exhaustive. Specific observations can be made provided some cases of sectors and/or particular information gaps are analysed which requires a separate study.

There remain certain issues in regard to the strategy and methodologies. There is an issue of centralisation vs decentralisation. An important issue is allocation of resources. Yet, another issue is adaptation of latest information technologies which are apparently capital-intensive, while we are faced with a labour surplus economy. In this connection, an issue can also be raised as to what extent R and D should be developed within the country and self-reliance should be achieved in the supplies of SW and HW. A discussion on these issues also requires a separate study.

Annexure

Major Characteristics of Development Information System (DIS) in India

	Characteristics	Description
1	National Policy and Strategy	To improve the data base in regard to the areas identified and augmenting the data-processing capabilities (Seventh Plan), promoting appropriate computer-based information system (NIC) and timely dissemination (Seventh Plan)
2	Political authority and responsibility	Minister of Planning and Deputy Chairman, Planning Commission.
3	Overall Co-ordination	Ministry of Planning
4	Central/National Implementing/ Co-ordinating Organisations	Central Statistical Organisation (CSO), Ministry of Planning, New Delhi. National Sample Survey Organisation (NSSO), Ministry of Planning, New Delhi. National Informatic Centre (NIC), Ministry of Planning, New Delhi. Office of the Registrar General (RG) and Census Commissioner, Ministry of Home Affairs, New Delhi. Office of the Economic Adviser, Ministry of Industry, New Delhi. Labour Bureau, Ministry, of Labour, Chandigarh. Directorate General of Commercial Intelligence and Statistics (DGCI&S), Calcutta and National Trade Information Centre (forthcoming), presently handled by Trade Development Authority (TDA), Ministry of Commerce, New Delhi. Chief Controller of Accounts, Ministry of Finance, New Delhi. Reserve Bank of India (RBI), Bombay. Programme Implementation Ministry, New Delhi. Programme Evaluation Organisation (PEO), Planning Commission, New Delhi (and state capitals). National Information System for Science and Technology (NISSAT), Delhi. The Controller General of Patents, Designs and Trade-marks, New Delhi. University Grants Commission (UGC), Ministry of Education, New Delhi. In addition, several departments also contribute to DIS insofar as they collect data as by-product of (a) administration (revenue, railways, post and telegraph), (b) regulation of Economic Activities (civil supplies, import control), and/or (c) public utilities (water, electricity).
5	Advice	National Advisory Board on Statistics. Standing Committee for Directing and Reviewing Improvement of Data Base for Planning and Policy-Making, Planning Commission (Ministry of Planning) Working Group on Economic Advice and Statistics, Department of Statistics. Regional Accounts Committee, Department of Statistics Advisory Committee on National Accounts, Department of Statistics. Governing Council of NSSO, Department of Statistics. Adviser, Monitoring and Information Division Planning Commission (full-time). Adviser, Plan Information and Publicity, Planning Commission (Full-time). Consultative Committee of Members of Parliament, Ministry of Planning.
6	National Expenditure	Plan outlay* Rs 930 million (1984-85 prices) for 1985-86 to 1989-90 provided for the centre, states and union territories. Annual Plan outlay (at current prices) fo 1987-88 Rs 226.3 million. Plan outlay for NIC Rs 620 million (a 1984-85 prices) for 1985-86 to 1989-9 Annual Plan outlay for NIC 1987-8 Rs 330 million. Central annual budget* expenditur Rs 529.9 million for 1987-88 and Rs 627. million estimated for 1988-89. In addition the concerned department and specialis ed organisations have their own alloca tions for statistics assigned to them. State and union territories have their ow budget for statistics. NIC budget expenditure Rs 290 millio for 1987-88 and Rs 315 million estimate for 1988-89.
7	Central Cadre	Indian Statistical Service (ISS) since 1964
8	Training and Development	CSO, ISI and IASC—Professional an refresher courses.
9	Statistical Legislation	The Collection of Statistics Act, 1953 Factories Act, Mines Act, Census Act Registration of Births and Deaths Act Workmen's Compensation Act, Paymen of Wages Act, etc.
10	Statistical Standardisation, Quality Control (SQC) and OR	Steering Committee on Standardisation o Classification, New Delhi. SQC and OR division, ISI, Calcutta.
11	Scientific Societies/Associations	Conference of Central and State Statistical Organisations (COCSSO), New Delhi. Council for Scientific and Industrial Research (CSIR), New Delhi. Indian Agricultural Statistics Research Institute (IASRI), New Delhi. Indian Association for Research in National Income and Wealth (IARNIW), New Delhi. Indian National Scientific Documentation Centre (INSDOC), CSIR, New Delhi. Indian Statistical Institute (ISI), Calcutta, New Delhi and Bangalore, Institute of Research in Medical Statistics (IRMS), New Delhi. National Council of Applied Economic Research (NCAER), New Delhi. International Institute of Population Studies (IIPS), Bombay. International Statistics Education Centre (ISEC), New Delhi. Research and Information System (RIS) for Non-Aligned and other developing countries, New Delhi.
12	International Co-operation/Co-ordination	CSO, covering activities institutions like: Harmonisation of International Economic Classifications (UN); Review and Development of System of National Accounts (ESCAP); Statistical Institute for the Asia and Pacific (STAP); Expert Group Meeting on External Sector Transactions (IMF); and UN Information Referral System (INRES).
13	Progress Reporting	Annual Report of Department of Statistics, Ministry of Planning. Profile of Service of NIC. Five-Year and Annual Plans. Mid-Term Appraisal of the Five-Year Plan.
14	Statistical News	CSO's Quarterly Statistical Newsletter. NSSO's Sarvekshana (Survey).

* Covering Census, Statistics and Survey.

The reflections and issues are important insofar as one of the reasons why "Indian plans are good on paper but bad in implementation" is, to quote an experienced planner, that they are "informationally inadequate for arriving at appropriate targets, along with a set of operating rules which are relatively insensitive to conjunctural variations and also insufficiently permissive of autonomous decision-making by agents even in areas where they can be expected to be knowledgeable" [Chakravarty, 1987], and that an integrated system is yet to be fully developed.

Notes

[This paper was prepared in the author's personal capacity for the conference held in May 1988 in Beijing, organised jointly by the Data for Development International Association (Marseilles, France) and the People's Republic of China State Economic Information Centre on "Strategies and Methodologies for the Planning, Design and Implementation of Information Systems in Public Administration with Special Emphasis on Economic Information Systems".]

1 In our view, a system would mean a well designed framework of connected *sub-sets*, working together in a particular fashion, forming an integrated body as a functional whole, serving the stated objectives in the best possible manner.

2 The exact shares work out as shown in Table A.

3 Area (3,288 thousand sq kms) is seventh largest in the world. Population size is only second to China, now reaching close to 800 million. Indian polity consists of 25 states, 438 districts (covering a city, towns and villages), 12 cities each of the population more than 1 million, 3949 towns of population more than 5,000, and 557 thousand inhabited villages. GDP is $ 175.7 billion (1985), eleventh largest among the market economies comparable to that of Brazil. Manufacturing value added is over $ 30 billion (1985), thirteenth largest in the world. The number of registered factories alone (20 or more workers without aid of power or 10 or more workers with aid of power) is close to 100 thousand. In addition, there are small-scale industrial units (investment of Rs 3.5 million, 4.5 million of ancillary) numbering over 1.35 million (World Bank, 1987, and Indian sources).

4 Unorganised sector covers a large number of farmers, workers of cottage and village industries, creditors, artisans, small businessmen, domestic servants, repairers, small food caterers, persons involved in certain modes of transport, etc. Additionally, there is an 'informal' sector whose contribution is not reflected in estimates, covering housewives, children, owner labour, farm output which is not marketed, etc.

5 Certain estimates show the likely acute shortage of skilled manpower required for different computer applications during the present five-year plan period through 1990, taking current level of output: information analysts 7,750; system analysts (large) 11,500; system analysts (micro) 12,500; and programmers 50,000. It is observed that in such environment of acute shortage, government is unable to attract and retain good computer professionals [Bhatnagar, 1986].

6 Estimates of unaccounted ('black') economy are at 50 or even 100 per cent of GDP. A recent estimate of total 'black' income generation is at 30 per cent of GDP. But, a more reliable estimate (through excluding non-gold smuggling and black-marketing in foreign exchange and price-controlled commodities) is at 16-19 per cent of GDP, at current market prices, for 1983-84 [NIPFP, 1985, Ch XIII].

7 Minhas (a senior economist in ISI and a former member, Planning Commission), et al (1987) have remarked thus: "embarrassing surfeit of relevant data notwithstanding one is indeed saddened to note that we have failed to construct even one consumer price index, which might be taken as a correct representation of consumer price movements overtime for the entire rural or urban population of India, or any of the states".

8 This is brought out indicating (a) the high frequency of forecasts of major economic indicators with 'very significant'/'unacceptable' error, and (b) forecasts mostly erring on lower side (Table B).

9 Ghosh, a senior economist and formerly adviser in government has remarked thus: the "malaise of not tabulating data collected for administrative purposes is quite general; it permeates all departments. Information which is collected is not tabulated. Information which is tabulated is not made available to anybody outside the government, and quite frequently, even to people within the government."

10 It has been aptly observed that "these (developing or third world countries) simply do not have the decision autonomy, managerial capacity or margin of error (risk absorption capacity) to be able to struggle with basically static, doubtfully useful and terribly expensive information systems conceived with a technical rationality which falls so short... especially in not being adapted to political realities" [Crowther, 1987].

11 The material balances (pertaining to capacity/production, demand including exports and change in stocks, and imports) aside from financial and foreign payments balances, prepared for the Third Plan included 9 for agricultural commodities and 31 for industrial products (PC, 1966). The total number of material balances included in the Seventh Plan is 17 only (PC, 1985 and 1986). Considering the past planning experience and developments in information in the country, material balances for at least one hundred products should be aimed at corresponding the number of products under targeting annual plan reviews and mid-term appraisal. The number and updating system far excels in other centrally planned economies, notably the USSR where in exclusive organisation exists for developing input-output norms towards

TABLE A

Plan/Period (1)	Total Outlay (Rs ml) (2)	Outlay/ Expenditure on Statistics and NIC (Rs ml) (3)	Percentage Share of (3) in (4) (4)
Five Year Plan* 1985-90	1,800,000.0	1,550.0	0.086
Annual Plan* 1987-88	330,600.0	556.3	0.168
Central Government Budget**	661,608.1	819.9	0.124
Central Government Budget 1988-89	736,094.7	942.3	0.128

* Public Sector only.
** Revised estimates.

TABLE B: FORECASTING ERROR-PERCENTAGE DIFFERENTIAL BETWEEN FINAL AND FIRST[1] ESTIMATE, 1977-78 — 1985-86[2]

Indicator \ Error[2]	Insignificant < 5	Marginal >5–10	Significant >10–25	Very Significant >25–50	Unacceptable (deceptive) > 50	Direction of Error on Plus Side
1 GNP, at constant prices	(4)	1	3(3)	2(2)	3	7(5)
2 Agricultural production	(6)	1	2(1)	—	6(2)	6(7)
3 Industrial production	1(3)	1(2)	2(3)	1(1)	4	5(7)
4 Import at current prices	(5)	(2)	(2)	5	4	4(2)
5 Export at current prices	(6)	—	2(3)	4	3	5(6)

Notes: 1 Figures in parenthesis refer to revised in place of first/preliminary estimates, both compared to final. Percentage sign of differential is ignored.
2 Estimates (provisional/anticipated) for the passing year (say 1987-88) are published in Economic Survey (Latest 1987-88) of Ministry of Finance annually presented in February and just before the presentation of Central Budget of the coming year (latest 1988-89).
3 Further analysis of the differentials using Theil's decomposition procedure may reveal the 'bias' and variance/co-variance components of the forecasts.

building up a large number of material balances which are revised very frequently in response to changes in technology, efficiency or otherwise. This speaks volumes for a highly grown DIS in the USSR found necessary for its planning system. Due to glasnost and perestroika, its information needs cap. for external sector are likely to expand.

12 It is recommended that *ex-ante* and *ex-post* appraisal of projects related to DIS should be done in terms of projected scenario 'with' and 'without' expenditure on the information development project, apart from traditional cost-benefit analysis (IDAC-DFD, 1986, Working Group-B Report). The overall performance analysis should be done by way of estimating productivity in national accounting sense corresponding the expenditure [Raipuria, 1987]. Recently, a survey method has been suggested to evaluate the effectiveness of investment in information technologies (a brief on price waterhouse designed survey in *Financial Times*, London, February 17, 1987, p 11).

13 Finagles Law of Information is quoted as:
The information you have
is not what you want,
The information you want
is not what you need,
The information that you need
is not available.

14 At present, a number of macro-level forecasting models exist developed by different research groups. None of them may stand to test taken individually. The possibilities of 'interplay' of these models and even of data base have been generally ignored.

15 'GIGO' bias is misplaced in the sense that the garbage output comes out not because of the machine (artificial intelligence computers yet not out) but because of outdated, incomplete, unprocured or incomparable information. The real mesage is to improve the quality of information which we have touched upon at several places in the paper.

16 Recently, some attempts have been made at audio-and video-teleconferencing confining to few individuals, on experimental basis. The author has a comprehensive illustrative report on how teleconferencing and text communication can be made use of provided a briefing procedure manual on communication and infrastructure based on an exercise, focusing on global models and policy simulation, attempted with the help of IBM and local tele-communication organisation, the US, participated by the researchers of Australia, Hong Kong, Japan and the US, with host computer in MIT.

Information Support System for Urban Planning

Sreemay Basu

The development of an 'information system' for urban planning cannot be independent of the development of a 'planning system'. The fact that urban data bases are virtually non-existent in this country is a symptom of the amorphous nature of our current urban planning practice.

DATA or observations which comprise an information system do not exist in vacuum, they are purpose-specific. They have to be gathered with reference to a viewpoint, a specific frame of mind (collectively known as a 'paradigm' in Kuhn's terminology). Information for urban planning, therefore, can only be obtained when this 'framework' is defined; that is, the act of planning is made explicit and each task of the planning process identified. It is important to realise that this specific and systematic definition of the urban planning process must come *before* an information base can be created. It is not possible to create an 'integrated' (the question immediately arises, 'integrated with what?') information system which can help to make urban planning systematic. That would be trying to put the cart before the horse. The fact that urban data bases are virtually non-existent in this country is a symptom of the amorphous nature of our current urban planning practice.

National Commission on Urbanisation Recommendations

The NCU makes eight specific recommendations (Nos 71 to 78 inclusive) about an information system. It may be useful to group these into three broad categories. Recommendations regarding: (1) the purpose or use of the information system; (2) the content of the information system; and (3) the procedures for acquisition of information.

(i) *Purpose of an Urban Information System*

Recommendation No 74 prescribes that the purpose is to facilitate 'decision-making'; and Recommendation No 76 prescribes the use of location specific information system for 'urban planning'.

The distinction made between 'decision-making' and 'planning' is puzzling at first glance, since planning, obviously, involves decision-making as well. In this context, it seems useful to review the nature of the planning process.

Planning Process: In the classical representation, planning (like design) is thought of in terms of three components: analysis, synthesis and evaluation. Analysis is largely objective once a viewpoint or paradigm is assumed.

Planning Paradigm: The current viewpoint sees urban settlements as part of a rural-megalopolis continuum with its position in the hierarchy defined by the functions it performs and the 'command' area or extent of influence, that such functional specialisation exerts over other settlements (both upwards and downwards in the hierarchy) dispersed in geographical space. Such economic and physical interchange at the macro-level determines the 'content' of urban settlements. In the micro-level, urban settlements are seen as outcomes of the interaction of sub-systems relating to, among various others, land-use, transportation and other infrastructure, zoning regulations, socio-economic factors determining choice, housing costs/stock/type, pollution impacts. A hierarchy operates at this level as well, starting from site specific considerations. These constitute the smallest pieces of the urban planning puzzle which must be matched in upward order (right through to macro-level inter-regional aspects) to produce a coherent picture. The dynamic interrelation of these sub-systems at the micro-level defines the 'form' of the urban settlement.

Analysis: This systemic view of urban settlements defines the tasks that comprise the 'analysis' component of the planning process. In very broad terms, these are: establishing the past and present status and the projection of alternative futures.

Establishing past and present status, in the systems format, entails:

* definition of sub-systems,
* identification of all factors (variables) known to have relevance to the sub-system—both in theory and through empirical studies,
* estimating the extent (parameter co-efficients) to which these factors influence the sub-systems,
* testing with actual data (fit) to obtain explicit, testable re-definable, descriptions (models) of the sub-systems,
* identifying higher order interactions between sub-systems (linkages), and finally,
* understanding and capturing the interactions (dynamics) to integrate sub-systems into composite systems.

Projection of alternative futures, involves tracing the consequences of a proposed intervention (plan) in terms of changes expected in the present status (short-term) and then, generally, in the medium and long-term. For this task (simulation) two aspects are crucial. First, of course, is the accuracy with which the dynamics of the composite urban system has been modelled. It is possible to check this to a certain extent by testing (executed) interventions against time-series data going back to the past. However, there is a second aspect which is independent of this process of testing and refinement through application to data. This has to do with (structural) changes that occur over time. Variables lose their influence, or their significance, necessitating both calibration (re-estimation of parameter co-efficients) and redefinition (choosing of a new, more appropriate set of variables).

Synthesis: Synthesis refers to the act of generating interventions (solutions) to meet proposed objectives which have been examined and refined after analysis. Considerable confusion persists in planners' mind as to whether the synthesis of solutions follows automatically from analyses in some mechanical process. The apprehension that it might is perhaps the reason that planners in India have been so tardy in utilising computer-aided methods of analyses that have become routine around the world 10 years ago. The fear is, of course, that analytical method and computers will replace creativity, judgment, sense of values, and the aesthetics (which have evolved largely from architecture) on which traditional planning rests.

This confusion can be cleared and apprehensions laid to rest with a reference to the work which revolves around Kuhn and primarily Popper, in Philosophy of Science. He has argued conclusively against notions of 'induction' (or 'abduction' of Pierce's usage) and established that science is not merely a dull and semi-passive activity of analysis and bare generalisation but 'untypical', 'unduplicable' activity of creation. He makes abundantly clear that scientific theories cannot be derived mechanically from masses of observation (data) or even from the 'law-like generations' that may be deduced analytically from such data—but are a product of the human mind; personal, creative achievements of an astonishing order.

So also with Design. J C Jones (to whom we owe the terms 'analysis', 'synthesis' and 'evaluation') goes on to state, "The difficulty is that the imagination does not work well unless it is free to alternate between all aspects of the problem, in any order, and at any time, whereas logical analysis breaks down if there is the least departure from a systematic step-by-step sequence. It follows

hat any design method must permit both inds of thoughts to proceed together if any rogress is to be made."

In planning too, obviously, the act of ynthesis is creative and personal. There is n additional element of uncertainty (subectivity) because (as in Chadwick's view) lanning is, "future oriented, dealing with continuous succession of situations which o not exist at the time the plans are made". Moreover, this future (after Esherick) may omprise both the 'known and knowable' as vell as the 'unknown and unknowable'.

It is worthwhile to remember that a plan volves in time as well as in space. This emporal dimension is of fundamental mportance, and distinguishes planning from he related design disciplines. An engineer r architect is able to appreciate the consequences of his decisions as soon as the project construction is complete. A planner may not even witness the full consequence of his decisions in a life-time. The impact of an urban or regional level plan is so pervasive, extensive and inextricably related to the old state) that this sort of lag is inevitable before he system has time to stabilise. For some, planning has more in common with ecological adaptation than normal industrial processes of design.

Paradoxically, precisely because of the complexity and uncertainties associated with ecological adaptation, the need for 'analysis' s even greater in planning. While the power o foresee developments in an uncertain future to establish the 'planning context' must remain partly subjective, analytical techniques like modelling and simulation are he only means by which a range of possible consequences can be explored systematically and both interventions (plans), and this planning context' (system description), examined and re-defined. In the absence of such a comprehensive analytical framework all planning is *ad hoc* and will inevitably result in consequences that are unforeseen. "Planning in the abstract is a fruitless and delusionary exercise that leads only to temporally transient non-systems" (Wayne Myers, personal communication). It is prudent, even essential, for a poor country with severe resource constraints to invest resources in, and suffer through the tedium of, thorough analysis. Mistakes on paper are far less costly than in practice.

Evaluation: The final component of the planning process comprises both subjective and objective tasks. The need for planning arises out of perceptions which are based on a value system. Within this value system, planning may have a limiting character under protective goals, or an optimising character under maximising/minimising goals within given constraints. The criteria for evaluation must derive from such goals and the attendant 'objectives' (goals, in operational terms) of the planning exercise.

Given the objectives, the first task is to measure and compare the performance of all interventions (plans) in an economic and behavioural context. This process is non-judgmental, and can be largely achieved by application of land-use models. The second stage is additional analyses in the general nature of cost-benefit. The third and final stage is readjustments based on the earlier analyses and then, choice.

'Decision-Making' and 'Planning': It is, of course, also possible that no choice is made. The outcome of the planning process could well be to redefine objectives or even reconsider the goals. These tasks involving the formulation of goals, assignment of priorities and ranking of objectives must precede another round of the planning exercise. It is perhaps in these matters of 'meta' value judgments (which are thought to transcend the domain of planning and enter the area of policy-making) that the distinction can be drawn between 'decision-making' and 'planning' (refer to NCU recommendations Nos 74, 76).

This distinction is subjective and rests squarely on our system of government which assumes that there are fundamental issues too important to be left to planners. These are entrusted instead to politicians and, to a large degree (often by default), to bureaucrats. Politicians have to respond to party and electoral imperatives and bureaucrats to overburdens of work load. The basis of their judgments can be often hurried and, at times, biased. Their decisions are likely to vary with time, changes of personnel in key positions and with political circumstance. It is in the planners' jurisdiction, however, to trace the consequences of such decisions and, in appropriate cases, make explicit with the help of objective, defensible, analytical techniques, the underlying motives. This is the only way to ensure that these fundamental value judgments and decisions are made with consideration and rationality, and to prevent the interference of the motivated from subverting the good of the collective.

(2) *The Content of an Information System:*

Recommendation No 73 prescribes that two new data systems pertaining to land and the environment should be organised.

It is significant that the *only* recommendation pertaining to the 'content', arguably the more important of the three aspects ('purpose', 'content' and 'procedures'), should be so vague. It effectively underscores the point that data (or an information system) cannot even be specified, let alone assembled, without reference to an analytical framework.

Land and enviroment are catch-all categories. Elements in these two categories having clear reference to the context of urban settlements include, infrastructure, land-use/land cover, geology, soils, hydrology, topography, meteorology, epidemiology and (a recent category) contaminants. These have to be complemented by data on social and economic factors of known relevance to human behaviour and choice.

The systemic view (assuming general acceptance), imposes its requiremens of data. It is beyond the purview of a conceptual paper to attempt to define a composite system and derive the data requirements from it. However, the appended performance specifications excerpted from Britton Harris' *A Programme for Comprehensive Planning* may illustrate the dimensions of the task. (Readers interested in further details are referred to a joint proposal of the School of Planning and Architecture, New Delhi, and the University of Pennsylvania on developing micro-computer based planning systems for small cities of population one lakh, which incorporates the Harris formulation.)

(3) *Procedures for Acquisition of Information:*

Five of the eight NCU recommendations deal with methods of acquisition. Of these three (Nos 71, 72 and 75), refer to existing data and procedures. Descriptive data on many aspects already exists in varied forms of uncertain quality, with diverse agencies, mainly for the purpose of revenue and records. The poorness of the quality of this micro-level data obtains because planning in India is presently conducted largely in an aggregate information context. This has produced policy debate and 'speculations' relative to the future. Objective guidance regarding the consequences of policy alternatives requires development scenarios to be played out at the site level. These have never been called for. Thus there has been no attempt at collating the data from various sources in a common bank, converting them to a common basis for consistency, and checking them for accuracy.

Recommendation No 71 specifies that national level data should be spatially disaggregated. While this is an obvious requirement, the present data is not likely to be useful for micro-level planning. Problems of quality will remain.

Recommendation No 72 specifies that access to data at source should be made easier. This refers obliquely to the need for an informational infrastructure. In Myers' view (op cit), "Building, maintaining, and utilising such data bases requires informational infrastructure in the same way that development requires transportation infrastructure. Major components of such information infrastructure include trained personnel; facilities for data capture, conversion, and updating; computer hardware and software for data storage, retrieval, and analysis; and provisions for data flow both upward and downward in the planning hierarchy." A start has been made on a massive scale, but already there are signs of a lack of coordination of the efforts of the NIC, DRDA and department of statistics, who are providing computers at the district level under the seventh plan.

Recommendation No 75 which specifies the use of normal administrative processes, should be kept in mind, while implementing an information system. This is very important. For data gathering, maintenance and systematic updating on a large scale in India

it would be prohibitively expensive not to use the existing administrative apparatus. Old British procedures of settlement-based records keeping, which have fallen into disuse because of centralisation of planning practices (with an attendant shift of emphasis to 'sectors' and 'programmes') in the last 40 years, have merely to be revived. And personnel, of course, trained in modern methods. The focus of this effort has to be on planning system performance and operationality, rather than simple existence. A non-functional information infrastructure will be another massive drain on our resources.

For implementation of a planning system, Harris recommends that elements of a Geographic Information System (GIS) including a mapping capability and related data files should be prepared first; together with data input capabilities which would permit users to begin immediately on the collection of data and testing the visual potential of the system. Recommendation No 77 specifying the use of remote sensing endorses this idea. The government of India has already made a start by funding, for the last two years, the commissioner of land records, Gwalior, to computerise all land records of one district. Again, this development is compartmentalised. There is no attempt as yet to compile composite multi-factor thematic information on this site specific data base. India cannot afford this approach. The hardware and software to retrieve imaging and photographic inputs and then rectify and digitise them for automated cartography costs crores of rupees. These cannot be replicated *ad-infinitum*.

Although the first impression of map-oriented planners is usually to equate the potential of GIS to automatic cartography, the capability for quantitative analysis of spatial data is even more significant. Accordingly, the second stage of implementation should be concerned with the development of analytical capability. This is essential for integration of the GIS into a composite system for planning.

The subsequent steps in the implementation of a composite planning system are inclusion of some locational models like retail trade. Next, cost analysis and transport analysis could be developed simultaneously. This would be followed by the sequential installation of location/allocation models and finally by evaluation methods. This sequence assures that the users encounter the most familiar and simplest aspects of the system first, and progress in a step-wise fashion to the more unfamiliar and more complex.

The means of implementing such systems through pilot projects are proposed in recommendation No 78. However, to reiterate finally, the development of an 'information system' cannot be independent of the development of a 'planning system'. The pilot projects have to incorporate both tasks.

Appendix

Harris: A Programme for Comprehensive Planning.

—SUMMARY OF SYSTEM FUNCTIONS FOR COMPREHENSIVE PLANNING

System Functions

1 *General System functions*

System management and user interface

- Prompts the user
- Invokes other system functions
- Checks consistency of user actions
- Protects and saves data
- Accommodates addition of new modules to the system

Data entry procedures

- Accept and organise all data inputs, including map data
- Check input consistency and reject or correct inconsistent data

Output procedures provide assistance in:

- Report writing
- Formating tables
- Outputting charts, graphs, and maps

A2 *Geographic Information System (GIS) Functions*

Sketching (optional), supports:

- Sketching proposed buildings and neighbourhoods
- Assimilating previously prepared or standardised sketches
- Calculating site coverage, floor areas, and building volumes
- Passing data and information to mapping facilities

Mapping

- Accepts prepared map outlines and changes.
- Accepts user-defined small areas and transport links
- Linkage to data base permits production of interpretive maps
- Land uses and transport networks can be mapped

Data base management

- Data base is keyed to areas and transport links defined in maps
- Aggregation and some disaggregation of data is supported
- Aggregation can be over areas or over categories
- Data can be statistically analysed

Standard spread sheet and statistical functions

- Support modules dealing with cost analysis and evaluation

A3 *Modelling Functions*

Location/allocation models for projection and evaluation

- Housing, retail trade and services, offices, public facilities

Transport models

- Least cost routes, trip generation, assignment, modal choice, trip distribution, congestion analysis

Air and water pollution

A4 *Other Decision Support Functions*

Cost analysis

- Infrastructure: road, water supply, drainage, etc.
- Structures: residential, commercial, industrial, public facilities
- Site preparation

Evaluation and decision analysis methods

A5 *Functions Performed by Centralised Agencies with Local Co-operation*

Map definitions and digitising

Map and network plotting—black and white or colour

Assembly of national and regional data on

- Unit costs for plan elements
- Planning standards and requirements
- Behavioural parameters in transport and land-use or location.

Projections into the future of

- Levels of productivity and income
- Patterns of expenditure on goods and services
- Levels of public services
- Local population and economic activity
- Technology and space requirements.

B—URBAN FACILITIES PROVISION

B Needed Urban Facilities

The following is a tentative checklist of the facilities which must be provided for in a plan, and for which the planning effort must provide estimates of demand, decisions on levels of service, proposals for zoning and control, and calculations of cost and (possibly) benefit. There is a broad division between land-using and other facilities. Further disaggregation is required wherever the activities differ in their requirements, costs, and impacts.

Land-using facilities

1 Agriculture, forestry, fisheries, quarries, mining, etc.
2 Construction (management; storage of equipment and materials)
3 Manufacturing by category
4 Warehousing
5 Transport facilities: canals, roads, railroads, airports, garages, terminals of all kinds, yards
6 Electric generating and distribution stations
7 Water and sewage: storage, pumping, treatment
8 Dumps, landfill, incinerators
9 Shops and shopping centres
10 Offices of all types
11 Educational facilities of all types
12 Health facilities
13 Public safety facilities: police, fire, ambulance, etc.
14 Parks, playgrounds, and sports facilities
15 Housing

Other facilities

16 Underground sewage and water systems
17 Underground gas supplies
18 Electricity supply
19 Telephone lines
20 Underground transport and walkways (see 5).

C—INPUTS AND OUTPUTS OF DATA TO AND FROM MODELS

Variables \ Models	Transport							Locational			Other			
	Shortest Path	Airline Distances	Trip Generation	Trip Distribution	Choice of Mode	Vehicle Assignment	Congestion	Accessibility	Facility Location	Residential Location	Pollution Impacts	Construction Costs	Utility Costs	Trans fac Costs
Transport links	I					I/O	I/O				I		(I)	I
Network nodes	I													
Paths by back nodes	O					I								(I)
Node X-Y coordinates		I									I			
Interzone network costs	O				I			I	I	I				
Interzone airline dist.		O						(I)			(I)			
Accessibility measures			(I)					O

'Rent' or control var										I/O				
Pollution impacts											O			
Construction unit costs												I	I	I
Total precinct costs												O	O	O

Code for cell entries: I = Inputs, O = outputs, ( ) = Optional.

Bombay Factory Re-opens

Lockout lifted

THE gates of Hindustan Lever's Bombay Factory which, had remained closed since June 21, 1988 when the Company's first ever lockout came into effect, have re-opened.

The re-opening of the factory is a sequel to the announcement made by the Company on June 22, 1989 that the lockout would be lifted the following day in respect of those employees who were willing to provide an honest assurance for productive and disciplined working through individual agreements under the provisions of the Industrial Disputes Act. The lockout, however, continues for those who have not provided such an assurance. A notice making this announcement was displayed at the factory gate and was also published in various newspapers.

The Company's unilateral decision to lift the lockout as described above was in response to repeated appeals from a large section of the affected workmen who, seeing through the reasonableness of the conditions sought by the management to lift the lockout, were quite prepared to accept them and return to work. The workmen, already financially hardpressed, faced greater difficulties with the re-opening of schools/colleges after the summer vacation and the onset of the monsoons, and had also sought the State Chief Minister, Mr.Sharad Pawar's personal intervention.

The framework for an amicable resolution emerged after a series of meetings convened by the Chief Minister and the State Labour Department. At these meetings, the workmen's representatives sought compensation for the lockout period; this totally unreasonable request was rejected by the management.

The workmen's representatives expressed willingness to accept other preconditions such as need based deployment, maintenance of productivity norms and discipline, unhindered introduction of technology and modernisation for improving quality, productivity and factory operations strictly in accordance with the needs of the marketplace. They were also prepared to offer an honest commitment against indulging in go-slow and other disruptive practices. The State Government cautioned the Union against any future go-slow. The Government warned that it views work disruptions very seriously, and the Company would receive whatever permissions it required if the workmen ever reverted to any of their past disruptive ways.

The Chief Minister persuaded the management not to insist on a written agreement on proportionate wage cut in the event of a go- slow. He also suggested that the workers who provide an individual undertaking and return to work may be given an interest-free recoverable loan to alleviate their hardship. The management agreed to both these suggestions made by the Government. Dropping the demand for proportionate wage cut was in spite of the fact that the Industrial Court had held that in view of the union's track record, the management was quite fair in seeking an assurance on proportionate wage deduction in the event of a go-slow. The Company has extended to the workers rejoining the factory an interest-free loan of Rs.10,000, which will be recovered over a twelve month period.

According to the agreement reached, further wage improvements would be discussed after a settling-in period of one year; however, such wage improvements will be predominantly productivity linked. The union and the workers, who were interested in a bipartite resolution, saw no point in pursuing the lockout related court cases; those pending in the courts will be withdrawn by both parties, and no fresh litigation will be initiated. This will also prevent the ferreting out of union funds.

While there would be no retrenchment, for those who chose to voluntarily leave the services of the Company, the social security and resettlement scheme would be made available for a further period of six months in response to the request made by the union. The total benefit to the employees under this scheme ranges between 70% to 100% of their salary in addition to the normal retirement benefits such as Provident Fund and Gratuity. The principal features of the agreement, under the given circumstances, have protected the interest of the Company's various stakeholders.

Following the discussions and agreement reached in meetings with the Maharashtra Government, the Union representatives sought time of 24 hours (which was later extended by 48 hours) to convey their formal agreement on the plea that they wanted to explain the terms of the proposed agreement to the employees. In keeping with its previous record, however, the Union failed to ratify the agreement even after the extended period lapsed.

Meanwhile, the Company continued to be inundated with feelers from employees who were keen to return to disciplined and productive working. In view of the developments described above, the Company decided to unilaterally lift the lockout based on the agreement committed to the State Government. The vast majority of employees have responded promptly to the Company's gesture, each one of them assuring the management through a formal agreement under the Industrial Disputes Act, of their honest commitment to productive and disciplined working in a manner consistent with the dignity and self-respect of all concerned and the sustainable viability of the factory.

Work preparatory to the start-up of the various manufacturing sections is currently on in full swing, and the initial batches of certain products have begun to roll out of the factory. Wherever the nature of operations is based on continuous process, the wheels of production will begin to hum in about two to three weeks.

Interestingly, apart from the Rs.10,000 interest-free advance, the employees who have resumed duty have benefited in another way. As a result of the formula governing dearness allowance (DA) escalation which provides far more than 100% neutralisation of the increase in the cost of living index, the workmen's wages have gone up, in spite of the lockout, by between Rs.100 and Rs.260 per month.

Contrary to the mischievous propaganda in certain quarters that the lockout was aimed at 'teaching the militant Union leaders a lesson', the stark reality is that the Company lost production valued at over Rs.300 crores during this period, while the employees lost wages to the tune of Rs.16 crores. The Company continued to service the interests of its consumers and shareholders, thanks to the excellent cooperation received from its employees at the other factories all over the country.

Repairing a damaged industrial environment is no easy task. However, now that the lockout is an event of the

ADVT

past, the management hopes that the resumption of normal operations will provide a climate which will restore to the factory a harmonious working environment based on the mutuality of interests it shares with the employees. The Bombay Factory team should now work with renewed vigour towards an era of greater productivity, which is vital for the factory's sustained working in the face of a liberalised economy and a highly competitive marketplace.

The Background

Hindustan Lever has traditionally enjoyed harmonious relations with its employees, a total of nearly 10,000 at its various factories. The Company was among the first manufacturing organisations in the country to enter into long-term wage settlements with recognised trade unions.

Bombay Factory is the Company's oldest and largest. Set up as a small unit in 1932, it currently employs about 2,500 persons and produces almost the entire range of the Company's products – laundry and toilet soaps, synthetic detergents, vanaspati, personal care products and glycerine.

For the first time in its long history, Hindustan Lever had to declare a lockout at Sewri from June 21, 1988. This was the culmination of a series of events over a number of years, which had cast a shadow on the factory's long term viability.

What trade unions have perhaps failed to realise is that the appalling inefficiencies, indiscipline, and poor work ethics, which may not have been as pernicious in the days of shortages and controls, stand painfully exposed as major weaknesses in today's industrial environment and marketplace which is characterised by liberalisation and heightened competition. Market forces are now compelling modernisation, productivity improvement and value addition efficiency like never before. Thus, unless organisations accord importance to the key tasks of productivity improvement and cost control, the door to industrial sickness will remain wide open.

The declaration of a lockout is an extremely painful decision to take for any management. Hindustan Lever, however, realised that any delay in attempting 'surgery' of this nature entailed the risk of rendering impossible the task of reviving the factory's long term viability; besides, the malaise could well spread. The lockout at the Bombay Factory has to be viewed in that light.

The roots of the problem can be traced to the last (1983) wage settlement which expired on June 30, 1986. Under one of the terms of this settlement, the workers had agreed to perform at a higher level of productivity and cooperate in the modernisation scheme. This was important, because the Bombay Factory wage bill had shown a steep rise although its productivity was much lower compared to the levels prevailing at the Company's other units.

Thus, Bombay Factory took 38 manhours to produce a tonne of toilet soap on a modern packing line, compared to around 18 manhours per tonne in our other units with older generation equipment and machinery. Likewise, while other units took 12 manhours to produce a ton of detergent bar, Bombay required 38 manhours.

The two key issues, therefore, were the Union's demand for higher wages and the management's concern about rampant indiscipline and declining labour productivity.

Is Hindustan Lever a fair employer?

To answer this question, you might be interested to know that the remuneration, welfare facilities and working conditions provided to Hindustan Lever employees at the various units are among the best in their respective regions.

Consider the case of the Bombay Factory employees. In January 1987, their wages ranged between a minimum of Rs.2,250 per month for unskilled employees and a maximum of Rs.6,800 per month for technical and clerical staff. During the thirty months when negotiations were in progress, the average wages increased automatically by Rs.400 to Rs.1,100 per month due to a most generous DA scheme which provides over 100% neutralisation of inflation, even at the high wages prevailing in the factory. The last twelve months (July 1988 to June 1989) have witnessed a further rise in DA of between Rs.100 and Rs.260 per month.

Wages trebled during 1978-87, rising at the rate of over 15% every year since 1982. Unfortunately, while wages skyrocketed by 300% during those ten years, productivity dropped by a fifth and the output per employee dipped sharply by 22%. As a matter of fact, the productivity of Bombay Factory is the lowest in the Company, despite:

— a well designed programme for upgrading skills and employee training;

— a Rs.30 crore modernisation drive (for improving production, product quality, energy cost and safety); and

— the highest wages among all other units.

The escalating wages and operating costs had by now seriously endangered the factory's health. The return on capital employed dropped by 26% between 1985 and 1987. The breakeven point rose sharply, from 60% in 1985 to 70% in 1987. Wages which accounted for 37% of the profits in 1985, increased to 46% in 1987. If this trend were to continue unchecked, wages would have wiped out the entire profits derived from this unit by 1993.

Why is labour productivity so low in Bombay Factory?

Despite the high capital investment (Rs.30 crores in the last few years) on modernisation, and productivity improvement measures, these had failed to bear fruit due to crippling go-slows and frequent work disruptions resorted to by the workmen at the behest of the Union leadership.

Contributing in no small measure to this depressing scenario was the persistent refusal of the Union to cooperate and participate in modernising and rationalising factory operations.

Some typical examples:

The Union refused to cooperate in producing the consumers' preferred choice of packing vanaspati in laminated pouches and polyjars instead of traditional tins. It refused to pack shampoos in pre-printed plastic bottles instead of old-fashioned glass bottles. Similarly, it opposed using laminated tubes for toothpaste instead of the traditional aluminium tubes, and even a change in the detergent bar pack size from 125 gm. to 250 gm. The Union was, thus, blocking the management's basic right to manage factory operations.

What's more, as a result of the Union's instigation, the employees gradually reduced their working on the shopfloor to just 2-3 hours per day. They refused to comply with the normal work-related instructions, and many even abstained from the training courses designed to enhance their knowledge and improve their skills.

All this resulted in an unabated rise in wages, while the factory experienced a sharp decline in labour productivity. Under these circumstances, the viability of Bombay Factory suffered steady erosion.

Why the lockout?

The employees' Union submitted a new charter of demands in July 1986. The charter contained a total of 36 demands involving for the Company an additional financial burden of over Rs.7,000 per worker per month. Some unusual demands in this charter include an 'unemployment allowance' for the children of employees, a hill station picnic allowance, reduction in working

hours, and additional leave. As usual, the Union's charter sought a steep wage hike without any commitment to raising productivity.

In the course of the negotiations, the management stipulated that a substantial portion of the wage increase would have to be matched by productivity improvement. But, even as talks between the management and the Union were in progress, the Union activists started a well planned agitation to coerce the management into conceding its demands through unrelenting militant tactics.

A go-slow, launched from January 1987, was accompanied by 56 incidents of flash, illegal strikes and 45 occasions of work stoppages -- all in violation of the ad interim injunction of the Industrial Court. The result? Production dipped to uneconomic levels. The workers also put up obscene posters and effigies, and abused factory managers virtually every day.

Matters came to a head when the Mathadi workers in total defiance of the Mathadi Board Chairman's directive to call off their own go-slow, begun in March 1988, suddenly struck work on May 25, 1988 at the instance of the extremist Union leaders, crippling the entire factory operations due to accumulation of stocks. The permanent employees' refusal to cooperate in the removal of accumulated stocks, brought factory operations to a standstill.

That was the last in a series of acts of indiscipline and frequent work stoppages by the Union, which had by now rendered the factory totally unmanageable; the management, therefore, had no option but to give notice of a lockout. A proposal for averting the lockout was conveyed to the Union even at this late stage, but without any response. Simply stated, what the Company had asked for is: a fair day's work (not mere presence at the work location) in return for a fair day's wages.

The aim of the Union activists now seemed to be clearer. It was not to protect the interests of the employees, but to paralyse the working of the factory and create chaos and anarchy. Since all efforts to restore normalcy bore no fruit and in view of the unbearable loss in production and rampant indiscipline, enforcement of the lockout became inevitable. Even so, the management took upon itself the task of reviewing the position at six-weekly intervals in a bid to determine whether conditions had materially improved, based on which extensions of the lockout were announced.

Both before and after the declaration of lockout, the State Labour Department met representatives of the management and the Union on several occasions in a bid to break the deadlock. No breakthrough was possible, however, in view of the Union's persistent refusal to even consider the management's proposal to revive the factory.

In actual fact, the proposal was largely a reiteration of the standing orders and service conditions governing the employment of workers at the factory. By their very nature, those provisions are taken for granted by factory managements under normal circumstances.

Courts Vindicate Company's Stand

The Union had been claiming in various fora that it had submitted the assurances desired by the management. The reality, however, was different and this was documented by the Industrial Court, Bombay, in its judgement dated November 25, 1988.

Disposing of an interim application filed by the Union, the judge observed that the workers had not been willing to provide the management with meaningful assurances relating to disciplined and productive working. The court verdict also rejected the Union's contention that the workers were willing to work and that the Company had not been prepared to provide work for them.

In another case, the Industrial Court, Maharashtra, held that extensions of the lockout by the management did not amount to a new lockout, but were in fact a continuation of the original lockout. The same court had earlier upheld the original lockout as legal and valid.

Overruling the Union's contention that the lockout extensions were for new and different reasons and that each extension called for a separate statutory notice, the court held that the Company had acted in a responsible manner by taking upon itself an obligation, which it was not obliged to under the law, to periodically review the situation to decide whether the lockout needed to be extended or called off if the workmen were prepared to submit meaningful assurances that would enable the factory to re-commence operations on a viable and sustainable basis.

The judge observed that the reasons for which the lockout had started, had not yet come to an end. He also noted that the Company had declared the lockout because the workers had not observed discipline and not given normal production, thereby causing the Company heavy losses. Referring to the repeated breach by the Union of the assurances it had provided to the statutory authorities in the past, the judgement recorded that what the management h sought was meaningful assurances, a not hollow assurances.

The court also held that the Comp ny's proposal to resolve the lockout b sed on a proportionate wage reducti in the event of wilful go-slow, did n amount to a unilateral change in t terms and conditions of service sin that was subject to acceptance by t Union and the workers.

Why the lockout continued so long

In the ultimate analysis, the intrans gent stance of a handful of Union ac vists unnecessarily prolonged t period of hardship for the employees. the Union had been sincere about reso ving the dispute, all it had to do wa accept the Company's proposal and er the hardship and agony of the worke and their families.

Observing that the Union did not ap pear concerned about their well being several workers in personal difficultie approached the management for help i various matters. In keeping with its tra dition, the Company took a sympatheti view of their problems, and worked ou a social security and resettlement pac kage which was voluntary -- both for th employees as well as the management The total benefit to the employees ran ged between 70% and 100% of their sala ry; in addition, they got the normal re tirement benefits such as Providen Fund and Gratuity. More than 550 em ployees availed of this package, an some more are expected to do so nov that it has been re-introduced for period of six months.

According to available evidence, another factor for the prolonged stalemate was the liberal funding of the extremist elements in control of the Union leadership by local and overseas sources. Masquerading as journalists and tourists, their contacts in Western Europe visited India for discussions with them. Prominent among them were Mr.Critt Pingen and Mr.Piet Blanken, belonging to the largest trade union federation in the Netherlands. These organisations seem to have a vested interest in destabilising the working of companies in developing countries. Companies which are major exporters are a prime target for them, since exports by such companies curtail their own employment opportunities at home.

There was also the matter of restoring faith. The management had lost its confidence in the internal leadership of the Union since it had gone back on every assurance given to the management and also to the courts.

A classic case is the 1983 settlement

ere the Union had agreed with the nagement to cooperate on moderni- on and redeployment of workers as a t of the overall agreement on its char- of demands. The management had noured its part of the deal by imple- nting the wage increases, etc. but the ion reneged on all its obligations and the contract it had signed.

SUMMARY

Hindustan Lever unilaterally lifted on ne 23, 1989 the lockout at its Bombay ctory. The management took this po- ve step as a part of its social responsi- ity, in response to the repeated ap- als made by the affected employees o had expressed their desire to re- me work and pursue gainful employ- ent after offering meaningful assuran- s. An end to the lockout -- the Compa- 's first ever -- came after an agree- ent was arrived at in the presence of State Government officials and the ief Minister, Mr.Sharad Pawar.

The management had been compelled declare the lockout in June 1988 follo- ng a long and protracted go-slow, mpant indiscipline, work stoppages and frequent disruptions, which had endangered the very existence of the establishment and consequently jeopardised the continued employment and well being of the factory employees.

The lockout, which extended over a year, benefited neither the management nor the employees, since the Company lost production valued at over Rs.300 crores while the employees lost wages to the tune of Rs.16 crores. However, in keeping with its tradition of fair play, the management offered a need-based social security and resettlement package for the employees' social and economic well being. This package has been re-introduced for a period of six months.

The Company's stand has been vindicated by the courts, which ruled that the original lockout, and the subsequent extensions, were legal. The courts held that the Company had acted in a responsible manner, that the reasons for which the lockout had started had not yet come to an end, that the Company was seeking from the Union and workers meaningful assurances, not hollow assurances, and that the Company's proposal for a proportionate reduction in the event of a willful go-slow did not amount to a unilateral change in the terms and conditions of service.

The resumption of factory operations is currently in progress. The highly paid employees who have got back their rightful employment will have to extend wholehearted cooperation in the management's key task of reviving the factory's viability, for which flexibility of operations based on market needs and redeployment of manpower will be prime features.

In the current industrial scenario which is characterised by a liberalised economy and a competitive marketplace, there can be no future for organisations which fall back on productivity and cost control measures. The trade unions will have to wake up to the reality that, in the changed environment, appalling inefficiencies and poor work ethics which may not have been as evident in the days of shortages and controls, will if allowed to go unchecked contribute to industrial sickness and the demise of even well established organisations.

NMDC HOLDS THE KEY TO THE LARGEST TREASURE CHEST—THE EARTH

Everyday, since its inception on November 15, 1958, the National Mineral Development Corporation, or NMDC as it is known, has been engaged in a search for minerals, the bountiful treasure that the world offers to mankind.

A search that has alongwith the toils of labour, brought the thrill of discovery to India. NMDC's eagle eye has been instrumental in finding significant deposits of iron ore, diamond, limestone, dolomite, rock phosphate, bauxite, gypsum, kyanite, feldspar, quartz, barytes, bentonite and many other minerals for itself and other agencies.

And while exploring, NMDC is also exporting iron ore to Japan and other countries. NMDC's consultancy cell is proving to be a bank of knowledge for mineral-oriented ventures all over the country.

NMDC now looks forward to an eventful period. A period of more dedication and endeavour.

View from Washington

G P Deshpande

The Soviet Union, Eastern Europe and the Third World edited by Roger E Kanet; Cambridge University Press, 1988; pp xvi + 233, £ 25.00, $ 39.50.

THERE are ten essays in this volume. They are selected from among those presented at the Third World Congress for Soviet and East European Studies held in Washington from October 30 to November 4, 1985. The book has been published in June 1988. The fact that these essays were written in 1985 would make this book essentially a pre-Gorbachev work. It is surprising that the editor has not found it necessary either to reorient these analyses to the changes being brought about by Gorbachev or to include a separate essay reviewing the Gorbachev phase. Kanet himself touches on a few changes in passing but his major thrust seems to be that the Gorbachev attitude to the third world amounts to no more than the expression of "sympathies for the aspirations of people who are attempting to overthrow the yoke of neo-colonialism". Not that he is very wrong. But this thesis needed more detailed arguing and by late 1987 or early 1988 when the book must have gone to the press, a good deal of material was available. In the circumstances Gorbachev gets precisely four references in the book and just one specifically for his foreign policy.

The ten essays in this volume are divided into three sections. The first, consisting of five essays, discusses "the third world in Soviet foreign policy". The second, consisting of three essays, relates to CMEA economic involvement in the third world. The last, consisting of two essays, reviews Soviet foreign policy toward Syria in the Andropov era and the Indo-Soviet security relations.

Kanet in his fairly detailed essay on the Soviet Union and the third world seems to base his reading on the assessment that the Soviet Union "is capable of projecting military, political, and economic power in most regions of the world". Military involvement from Angola to Afghanistan does give that impression. Yet what Rajen Menon said in an earlier volume edited by Kanet—and Kanet cites him without disapproval—is probably closer to the truth. Rajen Menon "cautions against exaggerating the ability of the Soviets to project military power in the face of US competition" (p 20). One way of describing Gorbachev's initiatives may well be that what Brezhnev saw as possibilities in terms of power the present Soviet leader sees as limitations. It is possible therefore that in power terms Gorbachev's Russia could do little more than expressing "sympathies for the aspirations of people who are attempting to overthrow the yoke of neo-colonialism" (p 14), a hypothesis which, as has been pointed out above, Kanet clearly does not take into account.

Kanet does point out, however, that Iurii Andropov had already voiced considerable scepticism about the benefits of extensive involvement in the third world. He also warns that "it is essential to recall that the growing costs of Soviet overseas commitments occurred precisely at the time that the Soviet economy was suffering from falling economic growth rates" (p 15). Yet in spite of this he makes the observation that "there is no evidence that Gorbachev and his associates are likely to initiate a policy of withdrawal from prior commitments". This only means that Gorbachev and his associates are more imaginative than the American political scientists happen to be.

Elizabeth Kridl Valkenier's assessment is closer to reality. Her essay analyses Soviet specialised writing on the third world. It is a pity that not much on these lines has been attempted in India. A section of the leftists here seem to think that as the Soviet Union has fallen from revolutionary virtue it does not require close looking at. The other section probably thinks that there have not been any more than some tactical changes in the CPSU's attitude and as such they need only endorsement. For the latter section in particular Valkenier's essay may be of some help. Her conclusions about "the evide pessimism and the attendant scaling dov of the former support for radical solution (p 36) and about the changes in the Sovi perspective spelling out "some positive pr mise for Soviet American relations" (p 3 might serve as useful reminders that all not well with the Soviet view of the thi world.

Martin Katz's piece on anti-Soviet i surgencies is a typical second cold war pie of writing. His view of the world is so ou moded that he does not seem to believe th Pol Pot's record in Cambodia is wort brooding over. In the year of our grace 198 it is amusing to read the confident assertio that the Afghan rebels cannot defeat th Soviets and the fighting is likely to continu for a long time to come. Presumably becaus of that, the [Afghan] regime would be quick ly overthrown without the presence of Sovie troops (p 52). I suppose it is not necessar to comment on that.

Paul Roth's essay on the Soviet Union an the NWIO is also of cold war vintage. Th second cold war initiated by Carter has en couraged a curious writing which ha prompted Roth to conclude his article wit what he calls "satirical paraphrase" — "A spectre is haunting Europe—the spectre o a worldwide free flow of information. Al powers of socialism have centred into a hol alliance to exorcise this spectre" (p 82). Well, Gorbachev and the editors of *Moscow News* are determined to prove him wrong. But perhaps that is not the issue. That this statement could be made in a book that must have gone to the press in late 1987 or early

88 is amazing indeed. Whether or not the viet government has done it, Paul Roth ems determined to "shield his citizens ainst information and opinions from road" (i e, the Soviet Union) (p 71).

Kanet's piece on the Soviet propaganda is likewise a disadvantage. It was first esented in a conference in Washington between June 25 and 27, 1985. It is not clear hat has been revised since. Kanet makes an nusing difference between propaganda and sinformation. He then goes on to further assify propaganda. It would appear, owever, that Gorbachev has made most of is discussion less than relevant. For mebody who does not take note of the hanges Gorbachev has brought about, it ould be too much to expect that he would e a difference between a Brezhnev and an ndropov. When your historical vision is so eak, you are bound to follow Karen rutents in seeing the "overrated worldwide nportance and revolutionary role of the naonal liberation struggle" (p 91). In fact, the aradox is that *today* Gorbachev himself night be arguing that. However, that does ot make Brutents' version historically right. t merely demonstrates the thorough and omplete unpreparedness of the academic stablishment to anticipate and, as in this ase, to come to terms with the changes which a clever statesman like Gorbachev (or ven Andropov and Chernenko earlier) inroduces from time to time. No wonder then hat Kanet finds the Soviet experts' argunent that "the United States is invariably llied to the local forces of reaction and aggression" as incomprehensible! He thinks hat the US was connected with a theological lictatorship like Zia's in Pakistan or semiacism of Pinochet in Chile; repression of Chen Du-huan in South Korea are all presunably a part of the Soviets' regular "attempt o tie the United States to these regional forces" (p 98). It might be difficult to locate a CPI intellectual mouthing such simplicities about the United States!

One can go on in this vein. We shall conclude this review with a reference to the last essay on Indo-Soviet security relations. Even his essay is partially affected by the general hrust of the book. Jyotirmoy Bannerjee says right at the beginning of his essay that 'though both India and United States pride hemselves as being democracies, they apparently find it easlier to deal with nondemocratic regimes than with each other" (p 212). This is a strange statement to make. Certainly Nehru's and Indira Gandhi's India had no difficulty with any 'democratic' regime. To put the American and Indian record on par in this regard is the most extraordinary. Indians have maintained excellent relations with nearly all democracies. They certainly have not backed a Pinochet or a Chen Du-huan.

That apart, Bannerjee's essay is a well documented piece of writing. He is able to see "the left political use" in domestic politics that Indira Gandhi made of the relationship with the Soviet Union. His analysis that she wanted to oppose the United States, Pakistan and China on the international political plane rather than from an automatic pro-Soviet orientation (p 219) seems much more realistic than what the earlier essays had offered. It is not clear, however, why Indira Gandhi would want to oppose the United States and what indeed are the indications of such an opposition. Here in New Delhi one gets the impression that the successive Indian leadership are doing everything possible to take the Americans along. It is they who decline. That's why the Japanese and the Germans and the Russians are doing better in India. Fact of the matter is that quite often the Americans take an 'ideological' view of the world and a practitioner of real-politik like Indira Gandhi is misunderstood in Washington. Because there they think that it is *their* right to play real or ideological politics and that the rest of the world must accept it. In a way that is the problem of this volume too.

A Critique without Prescriptions

B M Bhatia

Strategic Issues in Pakistan's Economic Development by Akmal Hussain; Progressive Publishers, Lahore, 1988; pp 397 + xvii-xxxviii, Pak Rs. 300.

EXCEPT for the 'Introductory Essay', written specifically for the publication under review, the rest of the book is a collection of the author's research papers and articles written on different occasions and for different purposes in the last few years. The papers deal with different aspects of Pakistan's economy and issues relating to the management of that economy. In the circumstances of it being a collection of disparate writings it is natural for the book to lack coherence and continuity. There is also a certain degree of annoying repetition of the same points in different parts of the book. All the same the book is not without its merits. Some of the pieces included in it not only make interesting but even rewarding reading.

Apart from the long introduction, which deals with Pakistan's growing problems of fiscal imbalances, deteriorating balance of payments situation, mounting public debt and debt service charges and the adjustment programme that Pakistan is obliged to undertake, to the detriment of the interests of its own economy, under the conditionality clauses imposed by IMF/World Bank as a pre-condition to grant of financial accommodation to the country, the book has four parts. Part I deals with the present state of Pakistan's economy and the policy options facing it. Part II studies "technical change: its nature and impact". Technological change in this part is studied in the context of the agricultural sector and the rural economy. The focus is on rural Punjab. Part III is devoted to the study of employment problems. Here again attention is concentrated on agriculture and its potential for greater labour absorption to mitigate the growing unemployment problem in the country. The impact of labour migration to the middle east on the domestic labour market is also discussed in this part. The last section of the book is historical. It traces the genesis of the Pakistan movement during the last phase of India's freedom struggle, the class composition, and ideology of the Muslim League's leadership and the evolution of Pakistan's society since birth. This part brings into clear relief the dominance that a well-knit civil-military-bureaucratic elite has come to acquire in the country and the resulting 'undermining of the civil society'.

A beautiful Punjabi poem of Najam Hussain Syed printed (in Persian script) on the front page sums up the central theme of the collection in this book. In its free translation the poem reads: "On a hot summer night, a wind blows out of the far off unfathomable ocean which says: the end of summer is not far off. Humans suffering from it may feel oppressed and helpless but I cannot be bound down by the oppressor. I am coming and the end of stifling and oppressive summer is not far off." Allegorically what the author wants to convey is that though Pakistan may be faced with overwhelming economic difficulties and problems at present and the picture of its economy may look dark, there is hope that winds of change may yet come. Unfortunately the author, nowhere in the book, spells out the policy package he would like adopted to extricate the country from its present mess. The book is more a critique of the official policies and actions in Pakistan than a constructive professional study offering policy suggestions for setting things aright.

In the first part, the author discusses the question of the high growth rate of over six per cent per annum that Pakistan has achieved during the first ten years of Zias' rule and the sustainability of the growth rate. He finds that "all the strategic variables and sectors through which growth is sustained seem to show a declining trend". Domestic savings rate which is around four and a half to five per cent of GDP, the growth rate of fixed investments which ranges between 16.5 and 17 per cent, the low growth rate of exports and the growing share of services which now exceeds 50 per cent in the composition of GDP are the examples quoted to illustrate the point.

Not only that. The growth itself is unreal, a sort of facade or a veil over a reality which is grim. Agriculture, which forms the backbone of Pakistan's economy, does not show adequate growth rate and continues to be highly dependent on rainfall. A single year

drought in 1983-84 (which incidentally was a peak production year in India) necessitated the import of 1.5 million tonnes of wheat to meet the deficit in domestic food supply. The green revolution has remained confined to Punjab and has not spread to the other provinces of the country. Land reform measures undertaken have been halting and badly implemented. The technological change in agriculture in Punjab has resulted in the sharpening of inequalities and income disparities so that capitalist farmers and agricultural labour are getting increasingly polarised in the rural areas. The incidence of poverty and malnutrition and also of rural unemployment remains high. The available estimates of rural poverty show that while incidence of poverty went up from 40.5 per cent in 1963-64 to 51.5 per cent in 1969-70, i e, during the Ayub's so-called 'development decade', it declined to 37.5 per cent in 1979. While claiming this figure to be an underestimate, the author concedes nevertheless that "some real decline in the percentage of the poor households did occur between 1969 and 1979 primarily because of the effect on rural wages and remittances of labour migration to Middle East", (p 11).

The subject of poverty is further pursued in Part II of the book. "Pakistan is a classic example of a capitalist underdeveloped country" the author writes (p 59), "which has experienced rising poverty during its periods of rapid economic development". There were only two such periods in the economic history of Pakistan, the Ayub era and the Zia era. The author gives sufficient evidence in regard to Ayub's decade but none whatsoever in regard to Zia's era. Hard statistical data for the latter period on this point remains to be compiled. But the fact remains that this period saw an unprecedented migration of labour to the middle east and bulging remittances every year from the expatriates. The remittances rose from a bare Rs 299 crore in 1975-76 to Rs 2,269 crore in 1980-81, and Rs 3,960 crore in 1985-86. In 1984-85 remittances formed 8 per cent of GDP and in 1985-86, 7.6 per cent. The remittances had a powerful impact on living standards of rural households particularly in Punjab and NWFP which provided the largest outflow of labour. As a result of labour migration abroad, real wages of labour in the domestic labour market rose and incidence of unemployment went down. The remittances have now started declining. After peaking to over US $ 3 billion in 1985-86 these have come down last year to US $ 1.8 billion. This is a cause of serious concern, not only to Pakistan authorities because of the implications that the decline has on the balance of payments situation, which is already serious enough, but also to the people because of its effect on the employment situation and threat to living standards of the migrants' families back home.

In the face of decline in labour demand abroad and the prospects at home, it is important that Pakistan explores alternative avenues of employment for its rapidly growing labour force. No conceivable amount of industrialisation in the near future can provide the needed amount of employment opportunities. The solution to the problem has to be found in a policy of greater absorption of labour in agriculture. This issue is discussed in part III of the book. This part is entirely devoted to the discussion of this subject. Here the author considers four policy options centring round the extent of use of tractors in farming which has the effect of displacing labour and affecting growth of agricultural production.

The fourth policy option based on the assumptions that (a) tractors adoption slows down to half the earlier growth rate; (b) a 13 per cent annual increase in water sector allocation, bringing 27.8 million acres under irrigation takes place; and (c) potential for increased yield that leads to 25 per cent increase in labour requirements per acre, is realised, projects an increase in labour demand, by the year 2002, of 710 million mandays or 20.5 million persons a year in the rural sector (pp 216-18). This is an interesting result. It accords with the view first expressed by S Ishikawa in 1967 that in Asian conditions, agriculture has to absorb more and more labour to relieve the pressure, of increasing supply of manpower on the labour market. This view has started receiving serious attention at the hands of the economists as is evident from the growing volume of literature on the subject, including some studies sponsored by ILO/ARTEP.

Part IV of the book treads familiar ground in respect of the muslim separatism in "undivided India". If the Congress was basically a middle class movement or at later stages a middle-class-led mass movement, the Muslim League was a muslim middle class-cum-muslim landed aristocracy party. "The muslim middle classes in the competition for jobs felt at a disadvantage *vis-a-vis* their Hindu counterparts. The Aligarh group, with the support of the British authorities, directed this tendency towards the demand for separate electorates and intensification of the communal issues" (pp 338-39). Again: "The efforts of the muslim land lords and muslim commercial interests to form a separate muslim political party intensified in an environment characterised by the Congress campaign for self rule" (p 339). The muslim middle class was, however, numerically weak so that when Pakistan was formed as a separate independent muslim state, the class failed to keep its hold on state power and yielded ground to the military and civil bureaucracy backed by the landed aristocracy to run the state. This explains the country being under the military rule for the larger part of its 42-year existence.

Though full of repetitions the book at least in some parts provides interesting and rewarding reading. The author now, as a member of, prime minister Benazir Bhuttos' economic advisory council, is in a position to shape economic policies of his country. The immediate task facing the democratically elected government is to steer the country out of the economic crisis in which it finds itself. The success with which that crisis is overcome will determine the long-term prospects of Pakistan's economy.

Class Politics, State Power and Legitimacy

James Petras

The notion of political legitimacy, which has become a central concern among academics, writers and journalists, is an irrelevant issue or at best a derivative or subsidiary concern. Different electoral regimes derive their legitimacy from different class reference groups and different balance of class forces.

Power, it is argued here, creates its own legitimacy. Those who do not have power seek it and not legitimacy. Power, in turn, revolves around class interests and control over the state. Those who neither have power nor are able to defend their class interests do not necessarily consider authority legitimate or illegitimate. They may pursue private interests, illegitimate or legitimate activity or collective political action outside the institutional framework of the political class.

THE concept of political legitimacy has become a central concern among a great number of writers, academics and journalists. Legitimacy has become the master key explaining the political process, the rise and decay of electoral and authoritarian regimes, the stability of social orders, the effectiveness of ruling classes and the contradictions of capitalist (or collectivist) societies. Starting from a discussion of legitimacy, this approach analyses how social classes, the state and the political class act to preserve or undermine it. In effect, normative, idealistic and subjective behaviour of individuals creates the basis for the socio-economic and political order. Values determine economic interests and condition their pursuit. Marx is turned on his head: collective material interests are subordinated to and derived from the pursuit of legitimacy.

There are essentially two approaches to critically analyse the issue of legitimacy. One is to question its centrality in analysing politics, to critically examine the assumptions that underlie the conceptual framework anchored in the concept of legitimacy. This approach questions the very usefulness of the notion—it questions the question: why study legitimacy?—and posits an alternative set of concepts starting from a different set of assumptions about the forces shaping political life. The second approach we can call an 'immanent critique', accepts the notion of legitimacy as possessing some analytical value and critically evaluates its relative utility in relation to other concepts, the specific groups for whom it has special importance and the degree of relevance in different political contexts.

For Marx the central issue was the exploitative economic system, based on the conflicting economic interests between the owners of the means of production and the wage earning working class. In the Marxist analysis, the problem was one of analysing the conditions under which the working class would organise itself into a collective force to transform the capitalist system. The Marxist analysis thus proceeds from an analysis of the social relations of production, to the social organisation of the exploited classes and to the question of state power.

In response to the challenge posed by the Marxist problematic, Max Weber formulated a counter-perspective starting from the other side. Since the organised working class was growing and extending its social power, it represented a challenge to the authority of the capitalist state. For Weber, the over-riding issue was the problem of authority, the means of securing obedience (legitimacy) and the consequences of the latter on the political institutional order (parties, electoral systems, etc). Weber's three-fold classification of authority—traditional, rational and charismatic—was accompanied by his belief that there was a logical-historical progression toward 'rational authority' accompanying the bureaucratisation of society. His analysis was fundamentally flawed as the eruption of class warfare, worldwide depression, the rise of fascism, world wars and subsequently colonial and neo-colonial wars was to demonstrate.

Yet in the late 1970s, a new generation of writers, mostly academics, has re-emerged who have taken up the major theme or concepts of Weber and have applied them to the political processes of the contemporary period. Self-consciously 'post- Marxist' and in some cases self-styled 'neo-Weberians', they have turned towards the notion of legitimacy as the organising principle of their analysis. Essentially, their trajectory involves a flight from class politics to the political class. They are the new crisis managers, pointing to the dilemmas of the political class, its fiscal crisis, the 'contradictions' between its need for legitimacy and its need for accumulation. Over and over they return to the problem of 'legitimacy'—the need to secure obedience or, in their own euphemistic vocabulary, consent. Like the mandarin of ancient China who offered their services to the emperor to secure a mandate from heaven, the neo-Weberian intellectuals (who are specialists in the manufacture of the symbols of power) offer to provide the appropriate values to secure legitimacy. And it is precisely the intellectuals' real or imagined proximity to the political class and their concern with its problems that explains the vehemence with which these 'post-Marxists' eschew any reference to class-based institutional power and any suggestion of the centrality of class conflict based on economic interests.

Power Creates Legitimacy

We want to argue that legitimacy is in many ways an irrelevant issue or at best a derivative or subsidiary concern. The thrust of our argument in the first instance is that power creates its own legitimacy. Those who do not have power seek it and not legitimacy. Power, in turn, revolves around class interests and control over the state. Those who neither have power nor are able to defend their class interests do not necessarily consider authority legitimate or illegitimate. They may pursue private interests, illegitimate or legitimate activity or collective political action outside the institutional framework of the political class.

The question of whether a regime is legitimate is not a major question in American politics. In recent years at least three regimes have been publicly exposed as violating the so-called 'democratic rules of the game' and it has not led to any major political movement, or any 'legitimacy crisis' or, for that matter, to any political crisis calling into question the political institutions. President Johnson's bypassing of Congress during the undeclared war in Vietnam and massive deception of Congress with the fabricated Tonkin incident is one example. President Nixon's Watergate incident highlighted the all-pervasive use of the secret police (FBI) and covert state operatives to undermine legal political opposition. President Reagan's Iran-Contra policy involved bypassing and deceiving the Congress, violating laws through massive sustained covert action. In addition, approximately 125 top officials in the Reagan Administration were involved, accused or convicted of criminal activity—and yet the 'legitimacy crisis' never entered into the subsequent electoral campaign.

For the affluent and politically visible classes social actions and relations favouring capital shaped 'legitimacy' not *vice versa*. Only among certain sectors of the liberal intelligentsia was the issue of legitimacy ever raised—more in esoteric books and infrequently read small magazines—in an effort to influence the political class. Even in this context, little was accomplished: the technocratic wing of the opposition (Democratic Party) was more interested in

publicising their management capacity than in raising the issue of a 'legitimacy crisis'. Furthermore, the majority of the opposition political class was competing for the favour of precisely those same affluent groups as the government party, and they were highly unlikely to get any support by calling into question the legitimacy of a system from which they were reaping such lucrative benefits. Even the populist opposition (grouped around the Jackson movement) did not raise the legitimacy issue, but rather fought its campaign around the issue of greater inclusion within the system; in fact, Jackson went further and argued that precisely his candidacy and presence was evidence of the maturity of the political institutions—a far cry from the purported crisis in legitimacy decreed by the neo-Weberians.

The great absentee electoral public (over 50 per cent of the US voters don't vote) is neither a sign of legitimacy or of illegitimacy —it is just ignored and the system functions as smoothly as if they did vote. Nor are the absentees, particularly those alienated poor blacks and white workers, responding to a legitimacy crisis. They are more concerned with issues of jobs, income, housing, health, education, security of employment. Because these fundamental issues are not resolved, they could serve as a basis for challenging the 'legitimacy' of the regime, if there existed a political class that could effectively organise these private discontents into a political programme. But in stating the issue of legitimacy in this fashion we are showing the manner in which the legitimacy is a derivative issue dependent on basic economic interests and conflicts contingent on political mobilisations.

Weberians and Neo-Weberians

The notion that legitimacy plays a major role in social domination is based on the assumption that there are reciprocal benefits between rulers and ruled. But as we have seen over the past decades, under neo-liberal and conservative regimes there have been asymmetrical benefits to those at the top and costs (borne by those below). Yet without reciprocity there have been no revolutionary movements or even radical challenges to authority. The supposed connection between reciprocity and legitimacy is a figment of the neo-Weberian imagination.

The assumption that counterposes legitimacy to force is another questionable assumption. Reagan's arbitrary dismissal of 14,000 air controllers and Thatcher's violent repression of the coal miners' strike reinforced their legitimacy in the eyes of their affluent visible public. Force and legitimacy are not opposed, but are dialectically interrelated—two sides of the same reality, reinforcing bourgeois domination within the electoral system.

Weber's notion of legitimacy is concerned with the conditions facilitating social domination—a point the Weberian epigones casually slide over. The ideal type legitimate social domination for Weber is where the subject obeys an order as if the order resulted from an inner decision and was thought to serve their interest. Underlying this 'ideal type' of legitimacy is Weber's explicit embrace of *subjectivistic* criteria (the *appearance* of interest-serving—not the substance), a *hierarchical* order (the identification of order givers and takers, and obedient subjects) and the abstraction of the subject from the larger social context (the 'individual' citizen and not the social class). Unlike the epigones, Weber is consciously reinforcing the centrality of a command structure of orders and obedience, basing it on a subjective (and manipulable) sense of interests (based on perceptions). The problem for the neo-Webs is how to translate this authoritarian conceptual framework into a post-Marxist, passably democratic argot. The procedure is rather simple: it requires a bit of intellectual amnesia and a great deal of abstract jargon, mixed in with constructing and knocking down Marxist straw-people.

In Weber's analysis the model of authority is a visible creature of the structure of property and property values and relations penetrate all structures of authority. Among the neo-Webs the issue of property—the great concentrations of capital— disappear or reappear as an afterthought. In its place are the problems of legitimacy and authority as 'things in themselves', like 'democracy'. In some cases, among the critical neo-Web writers they even counter-pose the electoral system and property in a so-called contradiction between capitalism and democracy, conveniently overlooking the thousand and one ways in which the values, financing and interchange of personnel from both are mutually interconnected and reinforcing.

The neo-Webs thus reduce the concept of legitimacy to a question of the political institutions—setting aside the class system (the relation of classes and the ruling class power structure). The setting aside of systemic and ruling class issues reflects the 'givens' in the political discourse of the neo-Webs and the changes in political context from the time Weber was writing. In the first decades of the century rising mass working class parties were challenging the bourgeois state, ruling classes were insecure, class relations were polarised—Weber had to address these issues, they had not become the 'parameters' of politics as they are for today's neo-Webs. In today's neo-conservative political climate, with labour in retreat, the epigones of Weber argue and debate the appropriate 'political formula'—the appropriate justification for the existing order— to invest in a ruling class. Hence the concern with legitimacy: to bring their orders into line with the subject's obedience.

Legitimacy for Whom?

The governing classes have a strong base of support—in the dominant classes, in the visible public and in the mass media. There is a power structure in place without much concern with legitimacy or that can create its own legitimacy—or buy it. In this sense, the search for legitimacy is the opium of the intellectuals: intoxicated with their own concerns, which they confuse with the larger society, they confuse the shadows of power for the real thing.

Both in the advanced capitalist countries and in the third world, legitimacy is about the working order of the institutional machinery—and pre-occupation with its breakdown. Here there is a difference: the institutional frameworks of the electoral regimes in the third world—particularly in Latin America—come into conflict with dynamic popular socio-political movements and economic interests and are incapable of responding to the demands for systemic changes. Hence the cries about a legitimacy crisis in the third world, hence the neo-Weberian attempts to prioritise the electoral regime over social-economic movements and adopt authoritarian measure of state repression to defend legitimacy, i e, the bourgeois electoral regimes. No such problems exist at the moment in the advanced capitalist countries—or, to put it better, state power is used to concentrate the endemic violence among the inner city poor.

Authoritarian rule growing out of class conflict is not illegitimate for the victors. Pinochet received 43 per cent of the vote in Chile and substantial majorities in three major affluent municipalities in Santiago (Providencia, Las Condes and Vitacura). For the rich and very rich, among the petty bourgeois who have benefited from his economic politics, the military dictatorship was a legitimate defender of class privilege. The same was true of the military regime in Brazil from the mid-1960s to the early 1970s.

Legitimacy has no meaning outside of the class-political context in which it is inserted. It has no universal normative meaning that can be applied to particular regimes for all classes in all periods. Legitimacy is a class specific concept: the question is legitimacy for whom and under what circumstances? This takes us to our second approach, which takes a middle position between the total rejectionist view of legitimacy and those who see it as a central concept in political analysis.

Legitimacy in Political Perspective

A more modest view of legitimacy places it in the context of having a secondary, reinforcing impact on the basic social and political relations and conflicts. Politics does not revolve around the issue of legitimacy, but it is not a factor that can be altogether ignored. First, it is important to separate the notion of legitimacy from a one-sided association with electoral systems. Non- electoral regimes have secured the consent of the populace through socio-economic policies, national struggles and a variety of other practices (imperial incursions, racist or chauvinist wars, etc). Eliciting consent on the basis of an electoral system has been one mechanism for securing legitimacy—and not always a successful one when basic social-economic interests are violated. Bourgeois electoral systems depend above all on the belief in the legitimacy of the ruling class. When class struggles erupt that challenge the power and prerogatives of the ruling class—

and thus question its legitimacy—the electoral system is vulnerable to overthrow and replacement by authoritarian institutions that safeguard bourgeois interests. Those new institutions partake of a class-specific legitimacy.

Legitimacy is not only tied to state institutions and their relations to citizen-subjects. Legitimacy can be built outside of the state from civil society. This, of course, challenges the institutionalist views of the orthodox neo-Webs who see mass movements as a threat to the stability of 'legitimate democratic institutions'—translated as a challenge to the monopoly of politics by the electoral political class and of violence by the state.

Thirdly, the concentration of power by a few international conglomerates has shrunken the boundaries of politics in the liberal western democracies: their role is increasingly an instrumental one, creating competitiveness, seeking markets, bargaining with other states over terms of economic exchange, co-ordinating fiscal, currency and financial policies, etc. The subordination and instrumentalisation of liberal democracy to concentrated corporate power makes the notion of a 'contradiction' between the two less plausible and problems of 'legitimacy' more a question of public relations manipulation than a basis for launching a political movement.

Fourthly, the neo-Web association of legitimacy with liberty has political meaning only in a public context: access to a public and to the means of communication to articulate ideas and organise movements. Liberty has no political meaning as individual private expression devoid of a public context: the isolated expression of ideas may have subjective value (the individuals may feel good that they have 'the freedom to express their views without physical harm') but it has no consequences for politics. There is a qualitative difference in the two contexts; without a public, liberty is essentially privatised— divorced from politics and power—and compatible with public tyranny. Public liberty pre-supposes private liberty, but is not identical with it. Private liberties do not pre-suppose public liberty, in fact in contemporary bourgeois electoral regimes private liberties are normally dissociated from public liberties. Discussion of legitimacy must distinguish between public and private liberty or fall prey to the coupling of the two and offer legitimacy to a tyrannical public order by celebrating private freedoms.

Because the political class has access to the public and depends on securing obedience, legitimacy fits into its ideological concerns. The neo-Webs provide an intellectual veneer for the failures of the political class by dichotomising the political choices: democracy or chaos, politics or anomie, elections or historical regression, transactions and negotiations within the political class or class/Hobbesian wars. The self- assertion of workers—that they are victims of the neo-liberal electoral game—is enlarged upon as a vehicle for strengthening democracy if and only if it is ultimately subordinated to the political class, which in turn is a loyal upholder of the capitalist rules of the game. Widespread disillusion with the electoral system, the decline of the political class, the rise of popular movements is described by the neo-Webs as a crisis of the state—not an affirmation of class power in civil society; movement displacement of conventional electoralist politicians is described as the disintegration of political society (politics guided and channelled by the political class).

Movement politics is a factor of political deterioration from the viewpoint of the political class, but it is a factor in the strengthening of civil society against the state from the perspective of the working and under classes. 'Legitimacy' takes different forms and is located in different sites, depending on whether one takes a state-political class centred view or a civil society-movement perspective.

Legitimacy can be conceived as a product earned through participation in the class struggle and the construction of class solidarity. Or it can be conceived of as the magic wand wielded by intellectuals seeking to secure state recognition. The self-defined role of intellectuals possessing the power to confer legitimacy on a regime is to argue that they are indispensable handmaidens of power.

Both in the third world and in the advanced capitalist countries major political forces—particularly bankers, bourgeois and in the third world the military and paramilitary groups—do not feel obligated to fight the battles of democracy or the meaning of democracy on the electoral terrain. Capital flight, credit freezes, threats of coups, corporate mergers and a host of other extra-parliamentary methods are all part of the real terrain in 'defining democracy'. Only the intellectuals of the political class believe that political struggle over the meaning of democracy should take place in the 'terrain of democracy', i e, parliamentary frameworks.

For the organic intellectuals of the political class 'democracy'—parliament, elections, parties and the 'rule of law'—constitutes the centrepiece of political legitimacy. For the popular classes in civil society, the socio-economic problems of declining standards of living, skyrocketing prices, deteriorating wages and the spread of temporary employment are the central issues defining their attitudes toward political authority. The dominant classes that address the interests of the latter can secure 'popular legitimacy' with or without the former. The ruling classes that address the interests of the political class can secure its legitimacy, but lacking a social base will find it difficult to sustain. Democracy or socialism is about the solution of people's basic needs—legitimacy is a derivative of that process. Insofar as democracy is an instrument of those ends, it secures its legitimacy. Material interests define the boundaries and provide the substance of the debate over legitimacy.

The debate about legitimacy as it is framed by Marxists is about the paths and directions which conflicting classes will take. To frame the problems of legitimacy in a class conflict framework raises fundamental questions. In the third world choices between paying overseas banks or meeting popular needs, defending human rights or absolving military tortures, promoting agro-business exporters or peasant producers and local consumers are irreconcilable choices that confound the babblers about 'democracy' without class definitions. The political pattern of the new electoral regimes in Latin America has been to speak to one set of interests (popular movements) during electoral campaigns and to work for another set of interests (banking, export elites) in power. The crisis of legitimacy of these bourgeois democracies—the mass disillusionment, urban uprisings and general strikes—has emerged from this double discourse, the consequent devaluation of democratic ideology and disrepute of the political class.

Legitimacy is part of the great debate among the intellectuals of the political class. Their number one priority is promoting and defending the political institutions of the political class. The alliance between the neo-Weberian intellectuals and the political class around the notion of defending the legitimacy of the institutions of the political class cuts across class boundaries and undermines the fundamental demands of the popular classes. The reverse is also true: consequential political leaders who articulate material demands of the social movements create a new legitimacy, one anchored in civil society that undermines the elite consensus and legitimacy of the political class and its organic intellectuals.

Legitimacy can only have meaning in a specific historical structural context—it cannot be considered in an ahistorical, asocial fashion. Broader structural factors (class relations) and social processes (levels of class struggle) shape the meaning of legitimacy. Being a derivative and dependent phenomenon does not detract from the potential importance that legitimacy may have as a secondary influence on the political process: reinforcing the roles and positions of class protagonists inside state structures and outside in civil society. While legitimacy is derivative of larger societal processes, it plays an important role in reinforcing outcomes.

Legitimacy as a concept requires specification of the levels of analysis: regime, government, state, as well as relations between the political class and civil society. Moreover, the notion of capitalist legitimacy is not tied either to Keynesian reformism or for that matter to democratic electoral regimes: the notion of legitimacy is linked to specific constituencies and social demands and time periods which coincide frequently with deep-seated cleavages. All of which is to say that legitimacy is a component of the analysis of political power whose importance can only be understood in relationship to the dynamic inter-action of class forces.

Styles of Legitimacy

There is no single style of legitimation, rather there are various types of legitimation varying with the social composition of the regime. We can for general purposes distinguish between two types, 'progressive' and 'reactionary' forms of legitimacy corresponding to different forms of regime: progressive legitimacy involves welfare measures in social democratic regimes, social transformation in revolutionary regimes and the extension of democratic rights in liberal democratic regimes. Reactionary forms of legitimacy include wars to legitimate military-industrial complexes, colonial wars to legitimate imperial regimes, repression of minorities to sustain racialist regimes and rapid economic growth to secure authoritarian military regimes. This diversity of forms of legitimation suggests that most ruling classes rule on the basis of class or racially select legitimation among politically visible minorities.

A legitimation crisis occurs when an active excluded group reacts to a regime and sustains a challenge to rulership. Mere abstention by majorities is no more of a problem to rulership than the passive unemployed are a threat to capitalism. Only when the abstaining majority become an active force hindering rulership do we have a crisis of legitimacy in the same way that the unemployed who take to the streets and threaten the accumulation process become a problem for capitalism.

In fact, an inactive abstentionist majority—the norm is the US electoral system—is functional in facilitating the legitimation functions of the state, freeing resources so that the state can increase its allocation to the visible minorities.

The electoral process which is central to legitimation is also a major factor facilitating the demobilisation of civil society, subordinating autonomous social movements to the political class, the political class to the party regime, the party regime to the executive, and the executive to the state apparatus.

In the transition from a deteriorating authoritarian to electoral regimes there is a dual process of reinforcing state authority and providing legitimacy to the continuing authoritarian institutions, while inserting within these institutions a set of electoral practices that elicit popular consent. In a word, electoral regimes procure popular legitimacy for authoritarian structures. When popular movements question the legitimacy of the state, a crisis emerges that is resolved either by deflecting opposition through regime changes; if that is not possible the electoral regime represses the populace.

Evolution of a Concept

In the advanced capitalist countries newly awakened concern with legitimacy first surfaced with the decline of the first wave of class struggle in the aftermath of World War II. The acquiescence of the working class with electoral regimes in western Europe in the context of an expanding world economy and the spread effects of the welfare state in the late 1950s served as the back drop for the capitalist restorationist writers to celebrate the legitimacy of capitalism. The second wave of writers on legitimacy emerged in the aftermath of the crisis of the 1970s and the subsequent period of prolonged economic stagnation without any upsurge of working class struggle. These neo-left writers began to relocate the contradictions of capitalism from the class structure to the state: positing a conflict between the legitimation and accumulation functions of the state. Essentially the struggles took place in the superstructure by and for the political class and their intellectual advisers.

The third phase of discussion on legitimacy, in the 1980s, coincides with the growth of the social movements (women, ecology, peace, animal rights, etc) which challenge state action and its right to act. The focus is on the cultural matrix and the legal basis and consequence of state action. For these post-modernists, class contradictions, struggle and action is described as 19th century residuals to be replaced by the post-modernist language of legitimacy crisis to be resovled by fashioning a new discourse. Curiously enough, the problems posed by the post-modernists resemble those found in the 18th century conflicts between monarchists and republicans—there too the issue was one of legitimacy and sovereignty. No doubt 18th century residuals can be recycled if they serve to update post-Marxist posturing.

Marxism versus Post-Modernism

All along the line there is a profound division between Marxists and the varieties of post-Marxists (post-modernists, neo-Weberians, etc). For, the latter subordinates the class struggle to political struggle among bourgeois factions; replaces class contradictions by cultural contradictions; substitutes the search for legitimacy for the struggle for class power; obscures the conflict between working class socialism and liberal democracy by focusing on individual rather than property rights; and finally prioritises political struggle within the state for struggles to transform the state.

The central issue of course is the relationship between electoral regimes and the state: the qualitative differences in interests vested in one or the other are obscured. Regimes decide the immediate interests of the dominant classes; states defend their permanent interests. The post-modernist argument of 'extending' democracy from the political to the economic sphere overlooks the constraints imposed by the authoritarian institutions of the state. The post-modernists fail to recognise the limits to reform imposed by the state and the reversibility of changes initiated by regimes (and not the process of gradual accumulation of reforms) as long as the state remains in place.

Recent history in Europe and North America provide ample proof of this process: the welfare reforms of the 1950-1970 period were challenged and reversed in the later 1970s and 1980s. The post-modernist effort to reduce qualitative class differences in state power into quantitative policy changes by regimes is an egregious error in method and theory.

Legitimacy and State Functions

On the left, the issue of legitimacy as a key analytical concept emerges during the period of capitalist expansion and the Keynesian welfare state: it is used to explain the state's role as a provider of welfare, a result of the need of the capitalist state to secure legitimacy.

The decline of the welfare state, the reconcentration of income at the top, the increasing role of the state as a vehicle for redistributing income from wage earners to property owners calls into question the notion of legitimacy tied to the welfare state and raises the further question of whether legitimacy—in the sense of popular assent to a governing regime—is a useful concept in analysing contemporary capitalist electoral institutions. The neo-conservative electoral regimes are 'legitimate' in the strictly legal sense of observing the correct procedures in the electoral process. But to go beyond that and attribute 'popular consent' to the regime is to enter into the class content of the regimes and their socio-economic policies and to overlook the lack of popular participation in the electoral process. Hence, the dilemma of critical legitimacy theorists of having a legitimate regime without popular consent.

The post-modern western intellectuals resolve this dilemma by attacking the older basis of legitimacy (or at least putting distance between themselves) based on the welfare state and working class politics: they launch full-scale attacks on the state, statism, public enterprises—and find political legitimacy in individual choice, the market and civil society, while the neo-liberal state seeks legitimacy from investors, bankers, financiers, the visible public.

In summary, different electoral regimes derive their legitimacy from different class reference groups and different balance of class forces. The intellectual commentators elaborate their theories of legitimacy according to which regime pre-dominates at any historical moment.

Monetary Targeting

Objectives and Appropriate Indicators

N A Mujumdar

We in India have adopted monetary targeting when the major industrial economies are moving away from it. Fortunately, the modified version of 'monetary targeting with feedback' recommended by the Chakravarty Committee reflects the lessons learnt from the experience of the developed economies and, to a limited extent, their adaptation to the specific situation of the Indian economy. In implementing the monetary targets, moreover, the recommendations of the Chakravarty Committee have not been followed in important respects.

THE latter half of the 1980s have been rather unheroic years for monetary policy in India. The phase of explicit monetary targeting unfortunately coincided with a period of fiscal profligacy with the result that the credibility of monetary planning has been seriously eroded. In the Seventh Plan document the amount of deficit financing was fixed at Rs 14,000 crore—a level which was considered to be within 'safe limits' or non-inflationary. In actual fact, the total quantum of deficit financing for the five years of the plan have turned out to be Rs 33,524 crore, that is, more than two-and-a-half times the safe level originally envisaged. Such unbridled deficit financing in a way belies claims of monetary planning and targeting. Moreover, the situation is further confounded by the choice of an inappropriate monetary aggregate for targeting. The whole set of issues relating to monetary planning, targeting and appropriate indicators for targeting needs therefore to be widely discussed and debated.

Objective of Monetary Policy

It is appropriate to begin the discussion on monetary targeting with a brief reference to the basic objectives of monetary policy. In India the major objectives of *macro* economic policy have been growth, equity or social justice, and price stability.[1] Monetary policy has to be designed to subserve these objectives. An endeavour to meet the credit requirements of all productive sectors of the economy, for instance, represents the growth objective, whereas prioritisation of sectors and concessional lending rates to these sectors represent the social justice objective. The dilemma of monetary policy is that if the growth objective is to be pursued by itself, the overall monetary expansion would turn out to be too large in view of the almost insatiable demand for credit. Obviously, this would jeopardise price stability and hence the growth objective has to be circumscribed by the objective of price stability. Thus, there is often a conflict of objectives and in the conduct of monetary policy a pragmatic trade-off becomes necessary. The quintessence of monetary policy is to reconcile these objectives while maintaining the overriding commitment to price stability. Thus, sustaining price stability without, at the same time, impeding the full realisation of the growth potential of the economy becomes the central objective of monetary policy.

The whole exercise of monetary planning, monetary targeting, and the choice of the indicators used for the purpose has to be judged against this broader perspective.

Underlying Rationale

Recognising that control of inflation is a primary objective of monetary policy, and that regulation of money supply is essential to achieving this objective, the Chakravarty Commitee[2] recommended that: "...the Reserve Bank of India adopt monetary targeting as an important monetary policy tool, subject to the cautions sounded by us. This would bind the Reserve Bank and the government of India in a common effort to achieve the desired rate of growth in money supply as in the Indian situation, control on monetary growth is impossible without the full support and understanding of the government."

Thus began the phase of explicit monetary targeting. For the first time, the central government budget for 1987-88 set out the target of net Reserve Bank of India (RBI) credit to government as an integral part of the targeting exercise.

At this stage it may be useful to add that in fact an *informal* framework for targeting the growth of money supply was already in existence. Over the years, there has been a progressive attempt to assess the market borrowing programme of the government, the visible deficit of the government—not net RBI credit—and the monetary budget as a set of internally consistent aggregates. While there were no public pronouncements on any specific monetary target, some broad perceptions of the desired rate of monetary expansion used to be exchanged annually, between RBI and the government; and these perceptions provided an important input to the formulation of the government's budget. Moreover, during the period 1981-84 of the IMF Extended Fund Facility Programme some ceilings on credit were stipulated as part of the performance criteria and these had to be given an element of pre-eminence in the conduct of monetary-fiscal policy. Thus, both the RBI and the government of India were already attuned to the process of monetary targeting. What really became necessary in the post-Chakravarty Committee phase was that this process of targeting became explicit, rather than informal, and also a more conscious commitment on the part of the government of India and the RBI to the agreed target was expected.

Strangely enough, the early 1980s also represented a phase when major industrial countries were moving away from reliance on monetary targeting. If this is so, why did the Chakravarty Committee think it appropriate to recommend monetary targeting for India? A straight answer is that monetary targeting, as recommended by the Chakravarty Committee, differs from the purely monetarist approach and in this context the following four features of monetary targeting need to be highlighted.

First, spelling out the analytical underpinning of the committee's report, Sukhamoy Chakravarty[3] has explained that to preserve price stability in the Indian situation, it is necessary to accord an important role to monetary policy within an overall framework of economic policy. This is indeed a diluted variant of the monetarist approach in the sense that it stresses that money plays a role although certainly *not* an exclusive role, in determining the dynamics of price movements. Second, the recommended approach is targeting with a difference: what the committee has recommended is "monetary targeting with feedback". The feedback is to emanate from the real sector and the specific mechanism suggested for this purpose is the mid-year review of the monetary target. Considering the importance of agriculture in the Indian economy, it is recommended that credit targets need to be reviewed and modified, if necessary, in the light of the size of the major kharif crop. Third, the target should be in terms of 'ranges', rather than in terms of a precise target of expansion. Fourth, the committee has recommended that the target be announced publicly so that it is open to public scrutiny; in fact the manner of implementing the target should be subjected to critical analysis by experts.

A clearer appreciation of these four features of the monetary targeting exercise shows that it is *not* a mechanical application of money supply regulation but a flexible mechanism responsive to mid-year developments. Sukhamoy Chakravarty has summed up the subtle difference between the recommended approach and the monetarist approach in the following words: "Unlike in the use of a rigid monetarist approach to targeting in which other sectors of the economy are expected to bear the burden of adjustment, monetary targeting with feed-

back as recommended by the committee is aimed at facilitating the smooth functioning of the other sectors of the economy."

Experience in Industrial Countries

Over much of the past decade, monetary policies in many industrial countries were oriented towards controlling the growth rates of monetary aggregates as a medium-term strategy for bringing down inflation. In their attempts to restore price stability, central banks had to exercise considerable discretion to deviate from, or adjust their monetary targets, instead of following the 'monetarist prescription' of pre-committing themselves and adhering rigidly to money supply rules. "Most central banks exercised discretion to adjust, de-emphasise, or abandon their targets in response to financial innovations and also deregulation, which have introduced new instruments to serve as money or money substitutes, with significant unanticipated effects on the relationships between targeted monetary aggregates and variables such as nominal gross national product (GNP). Discretion has also sometimes been exercised during periods in which unanticipated exchange rate developments have created concerns about the external influences on output and inflation."[4] This is the conclusion reached by the IMF paper which critically examined the practice of monetary targeting in seven major industrial countries—Canada, West Germany, France, Italy, Japan, the UK, and the US. The periods during which these countries used monetary targets date back to 1975 for the US, West Germany and Canada (Canada abandoned the practice in 1982); 1976 for the UK, and 1977 for France. Italy and Japan have not adopted monetary targets, though since 1978 Japan has been announcing in the first month of each quarter a projection for the year-on-year growth of broad money.

A review of the individual experiences of central banks in these countries reveals, first, that central banks cannot control their monetary aggregates precisely, and hence monetary targets have been specified more in terms of ranges, rather than in terms of points. Secondly, since it is impossible in practice to anticipate all the macro-economic disruptions to which it would be socially desirable for the central bank to react, rigid adherence to any mechanical rule would be both socially undesirable and politically infeasible. Discretion rather than rules thus forms the keynote of monetary planning and policy. Thirdly, the financial revolution has blurred many of the lines between different types of 'money' and introduced new versions as well.[5] Consequently, individual measures of monetary growth are a poor guide to short-term movements in demand and hence for the attainment of monetary policy objectives a movement towards multiple aggregates is discernible.

It is thus clear that the recommendations made by the Chakravarty Committee are fully consistent with the lessons drawn from the experience of monetary targeting in major industrial countries.

Choice of Appropriate Monetary Aggregate

Against the background of this experience, the next question to be posed is: What is the appropriate monetary aggregate for the purpose of monetary targeting in India? This question has assumed special significance because after 1978 the RBI switched over to broad money (M_3) from narrow money M_1 which was used earlier. The immediate provocation for such a switchover was the break in the series of data relating to M_1, which was caused by the change in the classification of savings deposits. Up to August 1978, the maximum amount that could be withdrawn from the savings account without previous notice was classified as the demand deposit component and the amount in excess of that as the time deposit component and the excess over this amount as the demand deposit component. Subsequently, this method of classification was modified and the average of the monthly minimum balances in a saving account on which interest is paid is now classified as the time deposit component and the excess over this amount as the demand component. This break in the M_1 series of data, discussed by K A Menon in the recent article,[6] has produced in its wake a far more fundamental change than merely "creating for researchers problems of comparability of data over time" as bemoaned by Arun Ghosh.[7] The reference here is to dethronement of M_1 by the RBI which started using M_3, to the exclusion of M_1, in all its monetary analysis. This also holds true for monetary targeting or for providing to bankers forecast of the broad parameters of money supply expansion in a given year.
